
Many of the Houses and Pits are of wide and lofty dimensions and together equal in length 1000 feet. They are all effectually heated by one *boiler*, which, during the severe winter months does not cost in labour and fuel more than 3*s.* 8*d.* per day, and the apparatus is so arranged that each House or Pit may be heated separately and to the required temperature. The splendid collections of Stove and Greenhouse Plants are also in the highest state of cultivation, and for sale at very low prices. Also a fine collection of strong Grape Vines in pots, from eyes, all the best sorts.

Plans, Models, and Estimates of Horticultural Buildings, also Catalogues of Plants, Vines, Seeds, &c., forwarded on application to JOHN WEEKS & Co., King's Road, Chelsea, London.

MANGER, RACK, & WATER-TROUGH AS ONE FIXTURE
IMPROVED AND NEWLY PATENTED.

COTTAM AND HALLEN, the original inventors, obtained the Great Exhibition Prize Medal for this arrangement, to which all the latest improvements are adapted, secured by Patent, including a method entirely new of attaching the halter-weight and rein from the back of the manger to the under front of the plate, allowing the horse greater freedom, and being noiseless in operation, add much to its comfort whilst feeding and convenience when at rest, as likewise, from their position, avoiding the liability of the most restive horse getting cast. No well-managed stable should be without these fittings.

COTTAM'S ENAMELLED MANGERS are constructed in the best possible manner, both as to form and utility; are cleanly in appearance, durable, and impervious to infection; manufactured Plain, Galvanised, and Enamelled. Improved Surface Drain, with Safety Covers, Sanitary Traps, Stable Pumps, Loose Box Fittings, Gutta Percha Preserving Saddle and Harness Brackets, and every article in Stable Furniture, in stock. An extensive assortment of Patterns for both Plain and Ornamental Castings, and every description of Wrought and Cast Iron Work for building and other purposes. Agricultural and Horticultural Implements, Iron Gates, both plain and ornamental, Hurdles, Strain Fencing, &c.

Estimates and Catalogues on application to COTTAM & HALLEN, 2, Winsley Street, Oxford Street.

WARMING AND VENTILATING.

BARTON'S PATENT SAFETY STABLE FITTINGS, AND ENAMELLED MANGERS.

THE only Patented invention of this description constructed so as to prevent considerable waste of Hay and Corn, together with all the newest improvements.

NEWLY IMPROVED ECONOMIC STABLE FITTINGS, FORTY SHILLINGS PER SET, to fill up the whole width of Stalls, and can be had enamelled or galvanised. Every description of Mangers, Racks, and Stable Furniture in stock; Iron Hurdles, Gates, Fencing, &c.

Manufacturer of Kite's Patent Noiseless Cast-Iron Smoke-Curing Chimney Caps (200 on Buckingham Palace), price 35*s.* each. Price Lists and Illustrated Catalogues forwarded on receipt of two postage stamps.

JAMES BARTON, IRON FOUNDER, &c., 370, Oxford Street, few doors east of the Pantheon.

(Fig. 1.)

(Fig. 2.)

J. TYLOR AND SON'S BARROW GARDEN ENGINE (Fig. 1), in best well painted oak tub, fitted with improved Pump, universal joint, and registered Spreader, which answers the purpose of the separate rose fan and jet.

No. 1 holds 10 gallons,			throws 30 feet high		...	£4 10
No. 2	" 15	"	" 45	"	...	5 10
No. 3	" 28	"	" 45	"	...	6 18

J. TYLOR & SON'S BARROW GARDEN ENGINE (Fig. 2), in strong tinned iron tub, well painted inside and outside, with improved Pump, universal joint, and registered Spreader, which answers the purpose of the separate rose fan and jet.

No. 10 holds	8 gallons,		throws 25 feet high		...	£2 15
No. 13	" 12	"	" 30	"	...	3 5
No. 11	" 16	"	" 40	"	...	4 0
No. 12	" 24	"	" 45	"	...	5 0
No. 14	" 30	"	" 45	"	...	5 18

A large assortment of every description of Garden Syringes, Pail Engines, Conservatory Pumps, &c., kept in Stock.

Full size Syringe, on Read's principle, of the very best quality and workmanship, with two roses and one jet, 21*s.*; Plain Syringes from 10*s.* 6*d.* upwards.

J. TYLOR & SON'S Horticultural Apparatus may be obtained at these prices from any respectable Ironmonger or Seedsmen in town or country, through whom alone they will be supplied, and of whom Drawings and Prices may be had.

N.B. Cost of carriage, &c., not included in these prices.

J. TYLOR & SON'S Manufactory, Warwick Lane, Newgate Street, London.

J. TYLOR AND SON'S REGISTERED GARDEN SYRINGE.—Small size, for Amateur use, **21s.** each; Large size, for Gardeners' use, **25s.** each.

By a simple arrangement this Syringe is rendered more effective than any portable Conservatory or Garden Pump ever offered to the public. It is equally adapted for Garden or Conservatory use, and is capable of discharging twice as much water in a given time as any other Syringe now in use. The arrangement consists in attaching a small flexible suction tube to the barrel of the Syringe, through which it is filled with water at every discharge of the previous contents. By this means the Syringe is always charged, and the pull-up stroke of the piston rendered perfectly easy, it having, indeed, no work to do, the barrel being previously full of water. Being thus made self-supplying, a great saving of labour is effected; and the necessity of stooping to fill the syringe at every discharge being done away with, the direction of the water can be maintained for any length of time. It is perfectly cleanly in its action, as it is not possible for any water to get on the outside of the barrel, which is a well-known inconvenience attendant on the use of every other Syringe. Its construction is perfectly simple, and cannot get out of order; the ground in ball valves and fittings used for filling all other patent Syringes being entirely superseded. To be had of any respectable Ironmonger or Seedsman in town or country.

J. TYLOR & SONS, Manufacturers of Horticultural Apparatus, Warwick Lane, Newgate Street, London.

N.B. These prices do not include carriage, package, or expenses of delivery in the country.

ROSES ON MANETTI STOCKS.

EDWARD PARKE FRANCIS offers the following ROSES, strong vigorous plants in small 32's and 48's size pots. Specimens of the complete success of Roses on the Manetti stock were exhibited at the Regent Street Rooms on Tuesday, the 3d, measuring 2 feet high and 1 foot through, 1 year's growth, and were the admiration of all who saw them.

Hertford Nurseries, Hertford. Carriage paid to London.

PRUNING.

THE GRECIAN PRUNING SAWS are universally acknowledged to be the best for every description of Pruning. They cut faster and cleaner than any other, and do not bend or break. Price 2*s.* 6*d.*, 3*s.*, and 3*s.* 6*d.* each.

THOMAS HILL, late W. Coleman, 4, Haymarket, London.

A RECEIPT FOR THE MILLION.

TO SET CAMELLIAS, with or without artificial heat, by a most simple means. Price 1*s.* 6*d.* by stamps.—Direct, post paid, to R. KEELE, Practical Gardener, 46, Wellington Street, Woolwich.

NURSERY AND SEED BUSINESS,
ESTABLISHED IN THE YEAR 1819.

TO BE LET, with immediate possession, the NURSERY and SEED SHOP at Taunton, for some time past in the occupation of Messrs. M'Intyre and M'Intosh. The Grounds and Stock are in excellent condition, moderately rented, and are well worthy the attention of any person wishing to carry on the business. If required the quantity of ground may be reduced. The Nursery is about 5 minutes' walk from the Railway Station. —Apply to Mr. YOUNG, the Proprietor, Elm Cottage, Taunton.

TO SMALL CAPITALISTS.

TO BE SOLD, the Lease of a Plant and Grape growing Business, in full working order, 3 miles from Covent Garden Market. It contains a convenient Cottage, with about 3000 feet of Glass, and 10,000 Plants. To any respectable man a part of the purchase money may remain, and be paid as agreed upon.—For further particulars apply (by letter only) to ALPHA, Office of this Paper.

TO GARDENERS AND OTHERS.

TO BE LET, within an easy distance of Covent Garden, a FLORIST BUSINESS, with four Large Greenhouses, a Propagating-house, with Pits, Frames, &c., with about half an acre of land, walled in, and a good stock of plants for market; rent moderate.—For particulars apply to T. B., Office of this Paper.

TO GENTLEMEN'S GARDENERS AND OTHERS.

TO BE LET, with immediate possession, a FLORIST'S, FRUITERER'S, and GREENGROCER'S BUSINESS, in a populous neighbourhood. It would be a good opening for a jobbing business. Coming in moderate.—Apply to H. S. H., Westcroft Place, Hammersmith.

POULTRY.—Eggs of Brahma Pootra Fowls at 10*s.* per dozen; Buff and Partridge Cochin China, Dorking, Black Spanish Fowls at 5*s.* per dozen, package included. Also a few pairs of each of the above and a pair of Golden Spangled Bantams on sale, at very moderate prices.—For particulars apply to AN AMATEUR, Matlock, Bath.

DORKING BLUE MOTTLED FOWLS' EGGS, 12*s.* per dozen. Took first Prize at Brighton Exhibition of three counties, 1854.—Address Mr. ED. HENDEN, Beehive Inn, Dorking, Surrey.

TO BE SOLD, BUFF COCHIN CHICKENS, from first class Prize Birds, Brahma Pootra Chickens, from imported American Prize Birds, and Spanish Chickens. Also some very good one-year-old Birds of the above descriptions. Wire, Game, and Poultry Netting, Poultry Hurdles, Hen-houses, Chicken Coops, Flower Stands, and Trainers, Garden Arches, and every kind of Wire Work, useful and ornamental.—T. H. Fox's, City of London Wire Works, 44, Skinner Street, and 6 & 8, Snow Hill. Illustrated Catalogues forwarded post free.

NURSERY GROUNDS, DUFFIELD ROAD, DERBY.
TO NURSERYMEN AND LANDSCAPE GARDENERS.

MR. POOL will Sell by Auction, on TUESDAY, WEDNESDAY, and THURSDAY, April 10th, 11th, and 12th, at 11 o'clock, at Mr. Palmer's Nursery Grounds, Duffield Road, Derby, the extensive and valuable Stock of Ornamental and Flowering Shrubs, Evergreens, Roses, Herbaceous Plants and Bulbous Roots of rare descriptions, Choice Fruit Trees, Tree Stocks, Implements, and other effects.

Auction Offices, Albert Street, Derby.

TO GENTLEMEN, FLORISTS, AND OTHERS.

MESSRS. PROTHEROE AND MORRIS will sell by Auction, at the Mart, Bartholomew Lane, on THURSDAY, April 12, at 12 o'clock, a first-class collection of Carnations, Picotees, and Pinks; about 100 fine double Camellias, well furnished with bloom buds, Standard and Dwarf Roses, American Plants, Choice Dahlias in dry roots, Fuchsias, and Verbenas, Azalea indica in bloom, &c.—May be viewed the morning of sale; Catalogues may be had at the Mart, and of the Auctioneers, American Nursery, Leytonstone.

STANDARD AND DWARF ROSES AND FRUIT TREES
THE PROPERTY OF AN EXTENSIVE GROWER, TO BE SOLD IN ABOUT 200 CONVENIENT LOTS, WITHOUT RESERVE.

MR. J. C. STEVENS begs to notify that he has received instructions to Sell by Auction, at his Great Room, 38, King Street, Covent Garden, on FRIDAY, April 13, at 12 o'clock precisely, 800 fine STANDARD ROSES, consisting of 11. P. Géant des Batailles, Duchess of Sutherland, Louis Napoleon, Mrs. Elliott, &c. &c.; B. Mrs. Bosanquet, Queen, Jupiter, Souchet, Emilie Courtier, &c; 500 strong Dwarfs, principally worked; 200 very fine dwarf Mayduke Cherry Trees in beautiful order for potting, and with ordinary treatment would have a large crop of fruit this season, being full of flower-buds. Upwards of 1000 Standard and Dwarf Apple, Apricot, Pear, and Plum Trees, including a a quantity of the Baddon Pippin, also a very fine un-named Seedling, equal for bearing and keeping to the Hanwell Souring, and good either for table or kitchen use.—May be viewed on the morning of sale, and Catalogues had of Mr. J. C. STEVENS, 38, King Street, Covent Garden.

A LIST OF GRASS SEEDS AND OTHER FARM SEEDS

OFFERED BY

J. C. WHEELER AND SON,

SEED GROWERS, GLOUCESTER,

(ESTABLISHED IN THE EARLY PART OF THE EIGHTEENTH CENTURY)*

SEEDSMEN TO THE GLOUCESTERSHIRE AGRICULTURAL SOCIETY.

The following are some of the best Natural Grasses well calculated for Permanent Pasture:—

Adapted for strong heavy land. MEADOW CATSTAIL, OR TIMOTHY GRASS (Phleum pratense) ... 10*d.* per lb
The Timothy Grass possesses the advantage of affording double the quantity of nutriment when its seeds are ripe that it does if cut when in flower. On strong, tenacious, and rather moist soils, it is entitled to a precedence to almost any other, and should at least form a considerable portion of the mixture employed for laying down such, either for alternate husbandry or permanent pasture.

Valuable for its earliness. MEADOW FOXTAIL GRASS (Alopecurus pratensis) ... ... 1*s.* 6*d.* per lb
This is one of the earliest and best of Pasture Grasses, but not so well adapted for hay, as it produces but few stalks; its root leaves are very broad, long, soft, slender, and grow rapidly when cut, or when eaten down by live stock. It requires two or three years after sowing to arrive at full maturity.

May be sown under trees. ROUGH COCKSFOOT (Dactylis glomerata) ... ... 1*s.* per lb
Is a valuable Grass in cultivation, on account of the great quantity of produce which it yields, and the rapidity with which its leaves grow after being cut. It is well adapted for growing in shady moist places under trees, as in orchards, &c.

Alternate culture. MEADOW FESCUE GRASS (Festuca pratensis) ... ... 1*s.* per lb
This is an excellent Grass, either for alternate husbandry or permanent pasture but more particularly the latter. It is well liked by all kinds of herbivorous animals.

Suitable for parks and valuable for sheep pasture. HARD FESCUE GRASS (Festuca duriuscula) ... ... 1*s.* per lb.
Will thrive on a great variety of soils, and is found to resist the effect of severe drought in summer, and to retain its verdure during the winter, in a remarkable degree. From the fineness of its foliage and greenness in winter, it is well adapted for sowing in parks, especially for sheep pasture.

Well liked by sheep. SHEEP FESCUE (Festuca ovina) ... ... 1*s.* per lb
This Grass forms the greater part of the sheep pasture of the Highlands. In quantity of Grass it is much inferior to the other cultivated Fescues; but, from being well liked by sheep, it should always enter into the composition of mixtures of lands on which they are to be pastured; in fact, on the authority of Linnæus, these animals have no relish for hills and heaths which are destitute of this Grass.

Well adapted for pleasure grounds. WOOD MEADOW GRASS (Poa nemoralis) ... ... 1*s.* 3*d.* per lb
Its habit of growth is delicate, upright, close, and regular. There is no Grass better adapted for pleasure grounds, particularly under trees, as it will not only grow in such places, but forms a fine sward where few of the other fine Grasses can exist. It produces a considerable deal of foliage early in spring.

Valuable for damp soils. ROUGH-STALKED MEADOW GRASS (Poa pratensis) ... ... 1*s.* per lb
This is a valuable Grass as a mixture for Grass Lands, particularly on damp soils. Its habit of growth fits it for mixing along with the upright grown sorts, such as the Italian Rye-grass.

Very early Grass. SMOOTH-STALKED MEADOW GRASS (Poa trivialis) ... ... 1*s.* per lb
This Grass yields a large quantity of herbage at a very early period of the season.

Remarkable for its fragrance. SWEET-SCENTED VERNAL GRASS (Anthoxanthum odoratum) ... 2*s.* per lb
This Grass yields but a scanty portion of herbage, yet, on the whole, Permanent Pasture should not be without a mixture of it, particularly in parks and pleasure grounds, were it for no other reason than its pleasant scent, not only when cut for hay, but also when the seeds become nearly ripe.

Suited for lawns. CRESTED DOGSTAIL GRASS (Cynosurus cristatus) ... ... 2*s.* per lb.
From this Grass forming a close turf, and having rather fine foliage, it may be advantageously sown on lawns and other places to be kept under by the scythe.

Lawn Grass. *For some of our descriptions of Grass Seeds, we are indebted to Lawson's Agrostographia.*

GRASS SEEDS.

Grass seeds more in demand of late. Inferior sorts used, and their pernicious results. The demand for Natural Grass Seeds has greatly increased during the last few years; formerly many of the better sorts were scarce and dear, and their price was such as to prevent their being generally brought into cultivation, so that recourse was had to seeds scattered about the hay loft, which being often mixed with inferior varieties and weeds, produced but an indifferent sward, and formed a striking contrast to those pastures where seeds of the best and most nutritive sorts had been sown.

Reduced prices of the best sorts. In consequence of the annually increasing demand for the better sorts of Grass Seeds, the price has been so reduced as to be within the reach of all, and more attention has been paid to saving and hand-picking them, keeping each sort separate and free from weeds; so that now whether land is required to be laid down for permanent pasture—or only for a year or two—under Trees, as in Orchards and Parks—in mossy and poor soil, or even on drifting sands, the different Grasses can be so selected and mixed as to form valuable pastures. For Lawns and Pleasure Grounds the finer growing sorts are well adapted, and a few months after sowing a fine sward is obtained, equal, if not superior to that formed by laying down turf, and at less than a quarter of the expense.

Usual time for sowing Grass seeds. In laying down Land for Permanent Pasture, the plan usually adopted is to sow the seeds in spring, on land with Barley or where a crop of Wheat is growing; but it is a question with some whether it is not better to sow the seeds on ground without any other crop; in this case, if the land is in a good state of cultivation, and the seed sown in the spring (say in March or April), a good crop of Grass can be obtained in a very short time. We have also known Grass Seeds sown in this way in August and the beginning of September with complete success.

Proportion of Clover. In selecting Seeds for laying down Permanent Pasture, there should be a proportion of Perennial Red Clover or Cow Grass (Trifolium pratense perenne), and also some of the Alsike Clover (Trifolium hybridum) mixed with the other Clovers. The Cow Grass is well known, and highly esteemed, but it is somewhat difficult to obtain *true*. *Alsike Clover.* The Alsike Clover is a cross, or hybrid, between the White Dutch and the Broad or Red Clover. The Messrs. Lawson, speaking of this variety, say, "It is deservedly in repute as one of the best Perennial Clovers, and well adapted for growing in this country; one proof of its valuable qualities is in the great and yearly increasing demand for its seeds; but hitherto, from the comparative high price, it has not received a fair trial in field culture. From the result of our experiments, it is found to thrive on such soils as are termed by the farmers 'Clover-sick,' and must, were it for this quality alone, prove a most valuable acquisition to our cultivated field plants."

Quantity of seed required per acre. Price. Renovation of old pastures. We have found by our experience about 12 lbs. of Clover Seed—a mixture of Alsike, Cow Grass, White Dutch, and Trefoil (the proportions varying according to the nature of the soil)—and 2 bushels of Grass Seeds to be about the quantity required for laying down *an acre of Permanent Pasture, and these Seeds we can supply at from* **24s. to 30s. per acre.**

For the improvement of Old Pastures, we should recommend, when the land is being dressed in the spring with manure, that about 8 or 10 lbs. of Grass Seed per acre be harrowed or bushed in with it; the quality and quantity of the herbage will be thus greatly improved. Suitable Seed for this purpose we can supply at **10d. per lb.**

SWEDE, MANGOLD WURZEL, TURNIP,

AND OTHER

AGRICULTURAL SEEDS.

CARROT—LARGE WHITE BELGIAN	2*s.* 6*d.* per lb.	*White Carrot.*
" LARGE RED ALTRINGHAM	3 0 "	
FRENCH FURZE, or GORSE	1 6 "	
KOHL RABI	3 6 "	
LUCERNE—FINEST IMPORTED	1 0 "	
PARSNIP—LARGE CATTLE	2 0 "	
VETCHES or TARES—SPRING		
" " WINTER		
SWEDES—IMPROVED WHITE	2 0 "	*Through the severity of last winter, Swede Seed is very scarce.*
" SKIRVING'S PURPLE TOP	2 0 "	
" LAING'S	2 0 "	
This is a well-formed and excellent Swede.		
" EAST LOTHIAN	2 2 "	
This is a large Swede, highly esteemed, and extensively grown in Scotland.		
TURNIP—TWEEDDALE YELLOW BULLOCK	2*s.* per lb.	*Quite new and scarce.*
This is a new Scotch Turnip, of excellent quality; it is a great improvement on the old Purple-top Yellow Scotch. The stock at present in cultivation is extremely limited, and we can offer it only in small quantities. We strongly recommend a small quantity to be sown as a sample.		
TURNIP—IMPROVED PURPLE-TOP YELLOW	1*s.* 6*d.* per lb.	*A valuable substitute for Swedes.*
The flesh and under part of the skin of this Turnip is deep yellow, with a purple top, hardy, of good size, and keeps well.		
TURNIP—LINCOLNSHIRE RED GLOBE	1*s.* 2*d.* per lb.	
This variety can be strongly recommended as a large handsome Turnip, of excellent quality.		
TURNIP—DALE'S HYBRID	1*s.* 2*d.* per lb.	
TURNIP—PURPLE-TOP ABERDEEN	1*s.* 2*d.* per lb.	
This is an old and very deservedly esteemed variety, and is considered by some to come nearest the Swedes, in hardness and solidity of texture.		
TURNIP—GREEN GLOBE...	1*s.* 2*d.* per lb.	
Roots of a fine globular shape, with a small neck and tap-root: very white under and green above the surface of the ground; of the medium size, hard and firm in texture.		
TURNIP—POMERANIAN	1*s.* 2*d.* per lb.	*The best White Globe Turnip.*
This variety was introduced some years since from Pomerania, and may be considered as the most perfect Globe Turnip in shape, as well as the most regular or uniform in growth. Its skin is of a smooth white and somewhat shining or transparent appearance; leaves smoothish, of a dark green colour, and whitish nerves.		
TURNIP—WHITE GLOBE	1 0 per lb.	
" EARLY STONE, or STUBBLE	1 6 "	
" GREEN ROUND NORFOLK	1 0 "	
" RED ROUND NORFOLK	1 0 "	
" WHITE ROUND NORFOLK	1 0 "	
" TANKARDS	1 0 "	
MANGOLD WURZEL—LARGE YELLOW GLOBE ...	1 0 "	*Of this we have a fine stock true to name, saved from selected Bulbs.*
" LONG RED	1 0 "	
" LONG YELLOW	1 0 "	
" RED GLOBE	1 0 "	

We can very strongly recommend our large Yellow Globe Mangold. Some very large roots have been exhibited at the Agricultural Show in this City, grown from Seeds supplied by us, many of the roots weighing from 30 lbs. to 40 lbs., and the average weight above 30 tons to the acre.

GARDEN SEEDS.

Seeds our own growth. Delivered carriage free. It is our earnest endeavour to send out all Seeds, whether for the Garden or Farm, of the very best quality, and true to name; and as many of the Seeds are our own growing, and are proved before sending out, we generally succeed in giving complete satisfaction to our customers. We are in receipt of most gratifying letters and renewed orders from those we had the honour of serving former years; and as we deliver our Seeds Carriage Free, we very respectfully solicit the honour of an order from those who have not yet given us a trial. We have the pleasure of subjoining the notice our Seed Catalogue has received:—

"The Catalogue of Seeds sold by J. C. WHEELER & SON, of Gloucester, appears to us to deserve notice, because of the stand which its authors make, in common with ourselves and others, against the useless incomprehensible Seed Lists of the day. In this, as in all matters of taste, there will be a difference of opinion as to the relative qualities of varieties; yet the mass of buyers who have no fancies, but who dislike being perplexed, and are satisfied with what is excellent, will greatly prefer a short, select Seed List to an interminable labyrinth of names, which, for the most part, represent nonenities or rubbish. Messrs. WHEELER's little book will do something to satisfy their expectations."—*Gardeners' Chronicle*, March 2.

We beg to offer the following Collections of Garden Seeds:— *Collections of Seeds.*

No. 1.—A COMPLETE COLLECTION, SUITABLE FOR A LARGE GARDEN	£3 0*s.* 0*d.*
No. 2.—A COLLECTION OF EQUALLY CHOICE VARIETIES, BUT SMALLER QUANTITIES	1 10 0
No. 3.—A COLLECTION SUITABLE FOR A SMALL GARDEN	0 15 0

These Collections will be delivered Carriage Free.

Early Orders are respectfully solicited. We deliver our Seeds Carriage Free.

* We cannot tell the exact year our Business was established, but we have in our possession a copy of a work written by "James Wheeler, Nurseryman in Gloucester," 1763, published in London by W. Owen, at Homer's Head, near Temple Bar, Fleet Street, entitled "THE BOTANISTS' AND GARDENERS' NEW DICTIONARY, containing the Names, Classes, Orders, Generic Characters, and Specific Distinctions of the several Plants cultivated in England according to the system of Linnæus; directing the culture of each Plant, describing its singular Virtues and Uses, and explaining the Terms peculiar to Botany and Gardening. In which is also comprised a 'Gardener's Calendar,' divided alphabetically, according to the Names of the twelve Months of the Year, directing the whole Practice of Gardening in the Flower Garden, the Seminary, the Fruit Garden, the Kitchen Garden, the Greenhouse, and the Stove."

J. C. WHEELER & SON, NURSERYMEN AND SEED GROWERS, GLOUCESTER.

Printed by WILLIAM BRADBURY, of No. 13, Upper Woburn Place, in the Parish of St. Pancras, and FREDERICK MELLETT EVANS, of No. 27, Victoria Street, in the Parish of St. Margaret and St. John, Westminster, both in the County of Middlesex, Printers, at their Office in Lombard Street, in the Precinct of Whitefriars, in the City of London; and published by them at the Office, No. 5, Charles Street, in the Parish of St. Paul's, Covent Garden, in the said County, where all Advertisements and Communications are to be ADDRESSED TO THE EDITOR.—SATURDAY, April 7, 1855.

THE GARDENERS' CHRONICLE AND AGRICULTURAL GAZETTE.

A Stamped Newspaper of Rural Economy and General News.—The Horticultural Part Edited by Professor Lindley.

HORTICULTURAL SOCIETY OF LONDON.—GARDEN EXHIBITIONS.

Notice is hereby given that the FIRST EXHIBITION of the Season will take place, by permission of her Majesty's Commissioners for the Great Exhibition of 1851, in the GROUNDS of GORE HOUSE, on WEDNESDAY, May 16.

Privileged Tickets at 3*s*. 6*d*. each are now issuing to Fellows of the Society, or their orders, at 21, Regent Street, daily from 11 to 4.

ROYAL BOTANIC SOCIETY, REGENT'S PARK.—The EXHIBITION of PLANTS, FLOWERS, and FRUIT this season will take place on WEDNESDAYS, May 9, June 13, and July 4; and of AMERICAN PLANTS, MONDAY, June 18.

Tickets of admission may be obtained at the Gardens only, by orders from Fellows or Members of the Society—price on or before May 5th, 4*s*.; after that day 5*s*. each.

CRYSTAL PALACE.—HORTICULTURAL FETE.—It is intended to hold a grand Horticultural Exhibition at the Palace on SATURDAY, the 2d of June next. The Rules and Schedules of Prizes are now ready, and can be obtained on application to the Secretary.

April 14. (By Order.) G. GROVE, Secretary.

BRIGHTON AND SUSSEX FLORICULTURAL AND HORTICULTURAL SOCIETY. — ROYAL PAVILION. — The Second Annual Summer Exhibition of Plants, Flowers, Fruits, &c., will be held on WEDNESDAY and THURSDAY, the 27th and 28th June next, on the same grand scale as last year. Schedules are now ready and can be had by application to E. SPARY, General Superintendent of the Exhibition, or of the Secretary, E. CARPENTER, 45, Lavender Street, Brighton. By the liberality of the Railway Company all plants will be conveyed to the Exhibition and back *carriage free* from all stations on the lines.—By order of the Committee,

EDWARD CARPENTER.

N.B. The Autumn Exhibition will take place on the 12th and 13th September next.

ENROLLED AGREEABLY TO ACT OF PARLIAMENT.

UNITED GARDENERS' BENEFIT SOCIETY, Waterloo Arms, Camberwell, Surrey. Instituted 1839.

This Society (established for Gardeners only under 35 years of age), has proved for 16 years the accuracy and soundness of principle upon which it is founded, namely, the highest amount of benefits to be received by its Members in Sickness, Superannuation, and Mortality, for the smallest amount of contribution consistent with stability and permanence. The accounts are always open to the inspection of all the members, who have also the control of the expenditure of its funds; it is therefore incumbent on all, by a small monthly contribution, to provide against the casualties of life, from which none are exempt, by enrolling themselves in a Society of this nature, which guarantees 12*s*. per week in sickness; 3*s*. and 4*s*. per week superannuation; 10*l*. at the death of a member, and 8*l*. member's wife, for the small contribution of 2*s*. 3*d*. per month.

Camberwell Green, Surrey. CHARLES STUNELL, Secretary.

WILLIAM MASTERS AND SON, LANDSCAPE GARDENERS, Exotic Nursery, Canterbury.

WILLIAM BARRATT, LANDSCAPE GARDENER, Wakefield.

*** Plans and Estimates furnished.

NOTICE.—As the Supply of the New RIDGE CUCUMBER "VECTIS" (advertised in the *Gardeners' Chronicle*, page 50 of No. 4, by THOS. TAYLOR), is limited, persons are requested to give their orders as early as possible.

THOS. TAYLOR, Nurseryman, Weston-super-mare.

NOTICE TO FARMERS AND OTHERS.—The Prices of Clover Seeds having advanced, and a REDUCTION having taken place in the price of several other kinds of Seeds, purchasers are recommended to procure a copy of the present prices, which will be sent post free on receipt of one penny stamp.

SUTTON & SONS, Seed Growers, Reading, Berks.

LIQUIDAMBAR.—The undernamed is a buyer of either a large or small quantity of the above. Send cash price, and height, to Mr. JEYES, Nurseries, Northampton.

SEEDS CARRIAGE FREE.

AGRICULTURAL SEEDS.—*Landed Proprietors and Farmers who require* LARGE QUANTITIES *of Turnip, Mangold Wurzel, Carrot, or any other kinds of Agricultural Seeds, will be supplied on the most liberal terms.*—Apply to

WILLIAM E. RENDLE & Co., Seed Merchants, Plymouth.

TO GROWERS OF VERBENAS.

JACOB SCOTT MATTHEWS, SPRING GARDENS, Cardiff, South Wales, begs to inform the Public that his stock of Autumn-struck Verbenas are now ready for sending out, consisting of 30 of the best Bedding varieties, fine Plants and well established in pots. Retail price, 1 doz., 3*s*.; 4 doz., 10*s*.; 9 doz., 20*s*. Carriage paid when 20*s*. worth or upwards is taken. The usual allowance to the Trade.

SEEDS FOR THE FARM, CARRIAGE FREE.—SEE RENDLE'S "FARMING PRICE CURRENT AND AGRICULTURAL DIRECTORY."

WILLIAM E. RENDLE & Co., Seed Merchants, Plymouth.

SPECIAL CONTRACTS FOR SEEDS.—*Noblemen, Clergymen, or Yeomen requiring large quantities, special contracts will be made, at a great reduction in price, on application to*

WILLIAM E. RENDLE & Co., Seed Merchants, Plymouth.

SUPERIOR WHITE BELGIAN CARROT SEED.

SUTTON AND SONS have some remarkably fine seed of this useful root. Whereas much of the Carrot Seed selling this season is acknowledged to be of inferior quality, Messrs. SUTTON & SONS having tested theirs, find it to germinate as well or better than any they have ever sold. Price according to quantity required.—Address SUTTON & SONS, Seed Growers, Reading, Berks.

ALSIKE CLOVER (TRIFOLIUM HYBRIDUM).

SUTTON AND SONS have some pure genuine Seed of this superior new CLOVER, which will be found an invaluable Perennial Plant.

LUCERNE.—FRESH IMPORTED SEED may be had of SUTTON & SONS, Reading, price 1*s*. per pound, or 95*s*. per cwt. April is the best month for sowing. True French Furze (Ulex europeus), 1*s*. per pound, or 95*s*. per cwt.

GRASS SEEDS.

J. C. WHEELER AND SON'S DESCRIPTIVE PRICED LIST OF GRASSES FOR PERMANENT PASTURE will be forwarded free by post on application.

J. C. WHEELER & SON, Gloucester, Seedsmen to the Gloucestershire Agricultural Society.

GIANT ASPARAGUS AND SEAKALE.

Strong 2 years old Giant Asparagus	...	...	15*s*. per 1000.
„ 3 „ „		3*s*. 6*d*. per 100, 25*s*.	„
„ 1 „ Seakale ...	...	5*s*.	„
„ 2 „ transplanted do.		10*s*.	„

YOUELL & Co., Royal Nursery, Great Yarmouth.

JOHN WEEKS AND CO. beg to intimate that they have still on hand a limited supply of superior imported STOCKS, raised in their own German Branch Establishment, which they are furnishing in Collections at 2*s*. 6*d*. to 10*s*. each Collection, according to quantity of Seeds and number of Varieties. They are sold out of German Asters, Zinnias, and Balsams of their own raising, and therefore are unable this season to attend to further orders.

Horticultural Establishment, King's Road, Chelsea.

RARE AND CHOICE FLOWER ROOTS, AT VERY REDUCED PRICES.

LILIUM LANCIFOLIUM RUBRUM, 2*s*. each, or 21*s*. per doz.
GLADIOLUS GANDAVENSIS, 3*s*. per dozen, or 21*s*. per 100.

The above are strong flowering roots.

To be had of WILLIAM DENYER, Seedsman and Florist, 82, Gracechurch Street, London.

Catalogues of all the New and Choice Flower and Vegetable Seeds forwarded on application.

HYACINTHS.

ARTHUR HENDERSON AND Co.'s Grand Collection of Hyacinths will be in great perfection during the next fortnight, which may be seen. Also the New Scarlet Verbena, Mrs. Woodroffe, at their Nursery, Pine-apple Place, Edgware Road, London.—April 14.

HOLLYHOCKS.

A. PAUL AND SON have for Sale a large Stock of fine double HOLLYHOCKS in separate colours, 30*s*. to 50*s*. per 100. Superior named varieties, 12*s*. per doz. and upwards. The plants are strong and in perfect health.

Nurseries, Cheshunt, Herts.

CAMELLIA JAPONICA.

CHANDLER AND SONS, extensive collection of this beautiful plant is now in flower, and will continue for some weeks. Also a great variety of flowering plants for Rooms and Conservatories.—Wandsworth Road, Vauxhall.

OSAGE ORANGE (MACLURA AURANTIACA).

CHARLWOOD AND CUMMINS can supply SEED of the above-named Hedge Plant at 4*s*. per lb., with full directions for treatment. The month of May is the best time for sowing.—14, Tavistock Row, Covent Garden, London.

H. LANE AND SON, The Nurseries, Great Berkhamsted, beg to inform their Patrons and Customers in general that they possess all the NEW ROSES of the Season, but, not having proved them, cannot confidently recommend them, not knowing their different qualities. The Rose Catalogue may be had on application.

FIRST-RATE NEW FUCHSIAS, VERBENAS, GERANIUMS, CINERARIAS, DAHLIAS, PANSIES, PETUNIAS, CARNATIONS, PICOTEES, GREENHOUSE, BEDDING PLANTS, &c., UNSURPASSED FOR CHEAPNESS AND QUALITY.

WILLIAM RUMLEY AND SONS NEW DESCRIPTIVE SPRING CATALOGUE, containing first-rate collections of the above, is now ready, and may be had on application.—Gilling, Richmond, Yorkshire.

J. FOWLE AND SON'S DESCRIPTIVE CATALOGUE OF VERBENAS, FUCHSIAS, DAHLIAS, GERANIUMS, CHRYSANTHEMUMS, HERBACEOUS PLANTS, &c. &c., is now ready, and can be had on application.—Holland Nursery, Holland Street, Brixton Road, Kennington.

PHLOX BEAUTY OF MILRIG.

DREGHORN AND AITKIN, NURSERY and SEEDSMEN, Kilmarnock, N.B., beg to acquaint the Public that they have still a small stock of the above PHLOX, which is considered by all good judges who have seen it in flower to be the best white Phlox in cultivation, both as to size and form of flower. Price 2*s*. 6*d*. each, with one added to every three ordered by the Trade.

D. & A. beg to acknowledge thankfully the large share of patronage they have received for this flower.

Kilmarnock, April 14.

NEW SCARLET VERBENA.—MRS. WOODROFFE.

ARTHUR HENDERSON AND CO. are now sending out this fine new VERBENA; particulars of which may be seen in their advertisement of the last week's *Gardeners' Chronicle*. The usual discount to the Trade.

☞ This Verbena is the same as "Conqueror," one offered by another firm.—Pine-apple Place, Edgware Road, London.

DWARF FRENCH BEANS can be had in any quantity.—Apply to J. G. WAITE, Seed Merchant, 181, High Holborn, London.

BLUE SCIMETAR PEAS.—May be had of the grower, T. K. THEDAM, Little Braxted, near Witham, Essex, at 12*s*. 6*d*. per bushel, carefully drawn.

STRAWBERRY PLANTS.

TROLLOP'S VICTORIA and KITLEY'S GOLIAH, two of the best in cultivation; strong Plants 10*s*. per 1000.—Address JAMES LAKE, Nurseryman, Bridgewater

STRONG SEAKALE.

JOSEPH FRYER, Clarendon Nurseries, Camberwell, can supply the Trade with a large quantity of the above. Price on application.

CEDRUS DEODARA—ONE-YEAR OLD SEEDLINGS.

MAULE AND SONS have a few Thousands of the above to offer at 10*l*. per thousand, strong healthy Plants. They still have a good supply of all sizes from 1 to 5 feet.

The Nurseries, Bristol, April 14.

A. VAN GEERT, NURSERYMAN, Ghent, Belgium, begs to inform Amateurs and the Trade that an Extract of his Catalogue and Price Current is just published, which may be had on application from his agent, Mr. R. SILBERRAD, 5, Harp Lane, Gt. Tower Street, London.

LARGE YELLOW GLOBE MANGOLD WURZEL, WHITE BELGIAN CARROT, SWEDE, AND TURNIP SEED, offered at Reduced Prices, which may be known on application to J. C. WHEELER & SON, Gloucester, Seedsmen to the Gloucestershire Agricultural Society.

SWEDE, CARROT, AND MANGOLD SEEDS.

TO BE SOLD, a few sacks of SKIRVING'S SWEDE, of last year's growth, from large roots; some YELLOW GLOBE and LONG RED MANGOLD; and ALTRINGHAM CARROT, all warranted.—Apply to Mr. GEO. TABER, Seed Grower, Rivenhall, Witham, Essex.

IMPORTANT TO FARMERS AND SEEDSMEN.

TO BE SOLD, Skirving's and Purple Top SWEDE TURNIP SEED (growth of 1854), from large roots, and planted out.—Apply to WILLIAM COOPER, Seed Grower, Eaton Socon, St. Neot's, Hunts.

TO BE SOLD CHEAP, price 60*l*., a small private Collection of ORCHIDS (180 Plants).—Apply to Messrs. FRASER'S, Nurserymen, Lea Bridge Road, Leyton, Essex.

SEEDLING SWEETBRIARS.

WANTED, from Two to Three Dozen of the above plants, very fragrant. State price per post.—Address to J. X. N., Parade, Nottingham.

WANTED.—Any one having a small weekly supply of CUT FLOWERS to dispose of may hear of a customer by applying to W. H. MAITLAND, 24, Regent Road, Liverpool.

ROGERS'S SEED DEPOT AND GARDENERS' REGISTRY OFFICE, Clock House, Chelsea.—Seed of the Osage Orange, Texian Grass, Whitlavia grandiflora, Holcus saccharatus, Eschscholtzia tenuifolia, Leptosiphon aureum, and all the New Things supplied, sent free per post.

SEED POTATOES, SOUND AND FREE FROM DISEASE

JOHN HARRISON begs to offer to the Trade a quantity of Fluke Kidney, Lapstone or Hayes Kidney, Ashleaf and Egyptian Kidney, Early Round Manly Potatoes, 5*s*. per bushel or 8*s*. per cwt.

JOHN HARRISON, Nursery, Seedsman, and Florist, Landscape Gardener, Darlington.

SECOND EARLYS.

JOSEPH WILSON, Ipswich, begs to offer the following Second Earlys; they are all fine samples, and entirely free from disease. The Derdby Drop, 28*s*. per sack (16 stones nett); Moss Kidneys, 24*s*.; Prolific do., 24*s*.; and Early Shaws, 21*s*. The excellent late variety Pink Kidney, 24*s*. Orders for the Champion Ashleaf, price 12*s*. per bushel, will be executed up to the 20th inst. Free to London. No charge for sacks. All orders must be accompanied by a remittance.

FLUKE KIDNEY POTATO.

T. F. WINSTANLEY has a very fine stock of the above unrivalled POTATO, selected small for SEED, as they do not bear cutting. Also Lapstone Kidney, Ashleaf, Flourball, and many other varieties. Prices on application. The Trade supplied.—28, Market Place, Manchester.

THE FLUKE KIDNEY POTATO.—This excellent variety is now planted here as the principal crop, being more free from disease and more prolific than any other in cultivation. It was raised in Middleton, and may be had genuine in any quantity at 5*s*. per bushel of 56 lbs.—Apply to JOHN HOLLAND, Bradshaw Gardens, Middleton, near Manchester.

Post-office Orders to be made payable at Middleton, Lancashire

THE FLUKE POTATO.—A new second early variety, surpassing every other in its capability of resisting the Potato disease, and without exception the finest and most prolific Potato in cultivation. Price per cwt., 15*s*., bags included.

To be had genuine of THORNHILL & DICKSON, Lawrence Hill Nurseries; and No. 1, Wine Street, Bristol.

THE LANCASHIRE FLUKE POTATO.—Fine medium-sized SEED of this celebrated variety, warranted true, to be disposed of, at 5*s*. per bushel of 60 lbs., bags included. A reduction will be made when a quantity is ordered. Post-office orders made payable at Bury, Lancashire.—ROBERT DAVENPORT, Gardener and Seedsman, Union Street, Bury, Lancashire.

Remittances requested from unknown correspondents. Post Office orders to be made payable to BASS & BROWN, or to STEPHEN BROWN, Seed and Horticultural Establishment, Sudbury, Suffolk.

MESSRS. WILLIAM ROLLISSON AND SONS embrace this medium of announcing that they will commence sending out the first week in May the annexed three new ERICAS, which they can with the greatest confidence recommend, and which will doubtless be as universally admired as the sorts hitherto introduced by them, among which we may name Cavendishi, jasminiflora, Hartnelli, Ventricosa superba, mutabilis, tortulæflora, Tricolor elegans, Sprengeli.

ERICA ÆMULA.—This is a very beautiful hybrid in the Erica Massoni section, of a fine bright crimson colour, after the style of Erica aristata, but very much higher in colour; altogether this is a very distinct variety. 21*s.*

ERICA EXIMIA SUPERBA.—This variety may really be said to be three times as fine as the parent whose name it bears; it is a very compact grower and excellent habit, with tubular blossoms of a fiery scarlet colour. This charming variety obtained the First Seedling Prize at the Royal Botanic Gardens, 1852. 31*s.* 6*d.*

ERICA PAXTONI.—A very distinct variety, obtained by hybridising Erica Hartnelli with Erica Massoni. It blossoms in very large whorls, of a soft red colour. This variety will be very useful for autumnal exhibition purposes, as it blossoms from July to October 21.

The Set of the above named Ericas three guineas.

The following choice and new Plants can be seen in blossom at the Nurseries:—

Brassia cinnamomeum (new).	Cypripedium Lowi (rare).
Cattleya Aclandiæ (rare).	Odontoglossum pescatoris (new).
„ ianthina (new).	„ hastilabium (rare).

With several Orchids equally rare.

The Nurseries, Tooting, London.

SIR COLIN CAMPBELL CUCUMBER.—This is the finest Cucumber ever grown for exhibition, produce, and perfection. No grower should be without this unequalled variety. It is a splendid Black Spine, and always grows of an even length. Price 3*s.* 6*d.* per packet, containing five seeds.

GOLDEN DROP (Green Flesh Melon.)—One of the finest flavoured and most handsome Melons ever yet grown.

SCARLET KING.—This is a splendid Scarlet Flesh Melon of a very superb variety.

Each, price 1*s.* 6*d.* per packet; or a packet of the Cucumber with a packet of either of the Melons for 4*s.* 6*d.*, sent post free on receipt of penny stamps to the amount.

*** In answer to numerous inquiries for "TILEY'S CHAMPION KIDNEY POTATO," E. T. begs to state that he has about 5 bushels more to dispose of at 1*l.* per bushel, or 5*s.* 6*d.* per peck, hamper and package included.

EDWARD TILEY, Nurseryman, Seedsman, and Florist, 4, Abbey Church Yard, Bath, Somerset.

SUPPLEMENT TO MAY'S CATALOGUE OF HARDY HERBACEOUS PLANTS to be had free by post on application at the Nursery. The Catalogue and Supplement contain the most rare and beautiful varieties of this interesting class of Plants, amounting to upwards of 2000 sorts:—

100 fine Herbaceous and Alpine Plants, named ...	£1	10	0
100 do. do. do., Purchasers' selection...	2	10	0
100 fine Double Hollyhocks	1	10	0
12 fine named Calceolarias, new	0	12	0
12 fine do. Shrubby do. do., including "Masterpiece," "Surprise," and "Superba"... ...	0	12	0
12 fine Ericas, named	0	12	0
12 do. Epacris do.	0	12	0
12 do. Cinerarias, do., including "Lord Stamford"	0	12	0

N.B.—A fine collection of Shrubs and Hardy Trees, also Greenhouse Plants, &c. &c. See Catalogue.—Address, HENRY MAY, The Hope Nurseries, near Bedale, Yorkshire.

ROBERT PARKER begs to inform his friends and the public that his New Spring Catalogue containing Descriptive and Priced Lists of the following:—

Exotic Orchids	Roses in pots
Ferns—stove, greenhouse, and hardy	Dahlias — show and fancy varieties
Geraniums—show, fancy, scarlet, variegated, and hybrid bedding varieties	Fuchsias
Chrysanthemums—large flowered, and Pompone varieties	Selaginillas or Lycopodiums
Petunias	Gloxinias
Antirrhinums	Cinerarias
	Calceolarias—bedding varieties
	Verbenas
	Miscellaneous bedding plants &c., &c.

Is now ready and can be had Post-free on application.

Paradise Nursery, Hornsey Road, Holloway, London.

TO WHEAT GROWERS.

PETER LAWSON AND SON, the QUEEN'S SEEDSMEN, Edinburgh and London, have received from North-West America a small quantity of two new kinds of WHEAT, which they are sending out in packets containing 200 grains. One kind is named Club-headed, cultivated by the old Californians. The yield is said to be very large, and forms a very beautiful delicate-coloured sample. Price 20*s.* per packet, containing 200 seeds.

The other kind is evidently a variety of Triticum durum, with solid stalks. It is very early, and well adapted for spring sowing. Price 15*s.* per packet, containing 200 seeds.—Orders may be sent to PETER LAWSON & SON, in Edinburgh; or direct to their London House, 27, Great George Street, Westminster.

RENDLE'S IMPROVED SWEDE TURNIP.—*This is the most hardy variety in cultivation, and has stood the late severe winter, in the most exposed situations, without the least injury. The Subscribers have received scores of letters during the past month to confirm this statement.*

It is handsome in form. Small tap roots, will keep longer than any other sort, and is altogether a most valuable variety.

It has been selected with much care for the last seven years, and the present stock has been saved by growers of the first respectability. Price 2s. per lb., or 1s. 9d. per lb. if taken by the cwt. Wholesale Dealers can be supplied with a few bushels.

For Description, Testimonials, and Engraving, see RENDLE'S "FARMING PRICE CURRENT AND AGRICULTURAL DIRECTORY."—Apply to WILLIAM E. RENDLE & Co., Seed Merchants, Plymouth.

BEDDING PLANTS.—AT 2*s.* 6*d.* PER DOZ.

JOHN SCOTT, Merriott Nurseries, Crewkerne, Somerset (established 1728), has nearly 20,000, in 3-inch pots, ready to be sent out. Post-office Orders payable at Crewkerne. (Baskets and Package at the Expense of Purchaser, and not returnable.)

200 Sorts of the best and newest Verbenas.
120 do. Scarlet and other Bedding Geraniums.
20 do. Variegated leaved ditto.
100 do. Fuchsia, all the best; 24 do. Shrubby Calceolarias; 24 do. Petunias; with Anagallis, Ageratums, Cupheas, Heliotropes, Lobelias, Salvias, Senecios, &c. Also the beautiful white Double Pyrethrum.

When a fair proportion of each is taken the price will be 2*s.* 6*d.* per dozen; but if only Calceolarias and Geraniums are ordered they will be 4*s.* per dozen. Catalogues, in which the above are arranged in sections of colour, &c., sent on receipt of a postage stamp. Parties requiring large quantities can have them in store pots by agreement.

NEW SHRUBBY CALCEOLARIAS.

MR. HENRY MAJOR, Knowsthorpe, near Leeds, begs to announce that his beautiful new Seedling Shrubby CALCEOLARIAS are now ready to send out, price 3*l.* the set of fifteen. The usual allowance to the trade for cash only. The following is Mr. Glenny's opinion upon them:—"Shrubby Calceolarias—Without exception the best batch of seedling Calceolarias we ever saw; we could pick out several that are far better than nine out of ten of the varieties now esteemed good."

H. M. offers a second set of twelve, to include all his best sorts sent out last year, price 25*s.*

Choice Calceolaria and Pansy Seed, 2*s.* 6*d.* per packet; also a few packets of very select Alpine Auricula Seed, 2*s.* 6*d.* per packet.

It is respectfully requested that orders from unknown correspondents be accompanied by a Post-office order.

Postage stamps are requested in payment of the seeds.

A descriptive Catalogue of the new Calceolarias may be had on application.

NEW ROSES.

MESSRS. WILLIAM ROLLISSON AND SONS beg to offer the following new Roses, which they will be able to supply in good healthy plants the first week in May, at 7*s.* 6*d.*, established in pots. Purchasers wishing for a less number than here enumerated, by leaving the selection to ourselves, may depend upon having the best and most desirable varieties chosen for them.

HYBRID PERPETUALS.

Abadie de Rougemont, bright crimson, very fine.
Baron Larray, fine rose, and beautiful shape.
Belle Lyonnaise, very double, blush white.

Carriage paid to London. The Descriptive Catalogue of Roses free per post. "The Rose Amateur's Guide," 5th edition, 3*s.* 6*d.* per post.—THOS. RIVERS, Nurseries, Sawbridgeworth, Herts, near the Harlow Station.

NEW EVERGREEN CLIMBING ROSE.

WILLIAM WOOD AND SON, Woodlands Nursery, Maresfield, near Uckfield, Sussex, beg to intimate to their friends that they ARE NOW prepared to send out AT ONCE good strong plants of WILLIAMS' EVERGREEN CLIMBING ROSE, at 3*s.* 6*d.* each, with the usual allowance to the trade, and a still further reduction if one dozen or more are ordered at once. Price may be had on application.

N.B.—Single Plants will be sent free per post on receipt of six penny postage stamps EXTRA to defray postage. Strong Plants of the above may also be obtained at the same price from Mr. CHARLES TURNER, of the Royal Nursery, Slough.

ROSES ON MANETTI STOCKS.

EDWARD PARKE FRANCIS offers the following ROSES, strong vigorous plants in small 32's and 48's size pots. Specimens of the complete success of Roses on the Manetti stock were exhibited at the Regent Street Rooms on Tuesday, the 3d, measuring 2 feet high and 1 foot through, 1 year's growth, and were the admiration of all who saw them.

N.B. The new Hybrid Perpetual Rose Emperor Napoleon will not be sent out before June; by that time I shall have proved it. If not more than semi-double, I much question if it is worth 7*s.* 6*d.* I, however, received a very high character of it, which induces me to offer it to the public, *but not to let it out before proving its worth.*

Carriage paid to any Station on the Eastern Counties Railway.
St. John's Street Nursery, Colchester.

NEW ROSES.

A. PAUL AND SON have to offer the following New ROSES, good healthy plants, for which early orders are solicited. The kinds marked thus (*) can be highly recommended from their own knowledge. Most of the others, *not having yet bloomed in England,* are offered on the faith of their respective raisers. The kinds marked thus (†) can be supplied either as Standards or Dwarfs, at the prices here attached:—

N.B.—*An unrivalled collection of Hollyhocks. Some thousands of Plants now ready, in fine healthy condition.*
Nurseries, Cheshunt, Herts.

FLOWER SEEDS.—We have selected out of our large collection of Flower Seeds the most beautiful and showy varieties, each sort distinct in colour, and calculated to produce a fine effect when planted out in beds or groups in the flower border. We have had each variety distinctly marked with the Botanical and English name, height, time of flowering, colour of the flower, manner of growing, whether erect or trailing, &c., the time it should be sown, and other valuable hints as to its cultivation. In selecting these varieties we have been careful to exclude all which are shy bloomers or have an insignificant appearance, so that the collections will comprise only those which are really showy and handsome, and which we believe would prove to the entire satisfaction of any lady or gentleman who might be disposed to order them. The German Stocks and Asters especially are most superb. The Collections will be sent free by post to any part of the kingdom at the following prices:—

20 extra fine varieties, all distinct and beautiful	...	5*s.* 0*d.*

AURICULAS, ALPINES, POLYANTHUSES, &c. Extra fine selected PANSY SEED, 1*s.* and 2*s.* per packet. Priced and Descriptive Catalogues are now ready, and may be had for one postage stamp. Post office orders to be made payable at Middleton, Lancashire.

The FLUKE KIDNEY POTATO, TRUE, 5*s.* per bushel of 56 lbs.

FINE MANGOLD WURZEL AND BELGIUM CARROT SEED

JAS. FAIRHEAD, SEED GROWER, Braintree, Essex, begs to offer, at moderate prices, ORANGE GLOBE, RED GLOBE, LONG RED, and LONG YELLOW MANGOLD WURZEL; WHITE and ORANGE GREEN-TOPPED BELGIUM CARROT, of selected Stocks, the growth of 1854.

Carriage paid to any Station on the Eastern Counties Railway.

TREES AND SHRUBS.—The annexed having been constantly removed are very suitable for immediate effect, having been grown more as single Specimens than Nursery Stock, and having formed large balls of earth. Every care is taken to ensure success.

Araucaria imbricata.	Deutzia gracilis.	Pinus Cembra.
Arborvitæ.	Holly, green.	" insignis.
Azaleas, Ghent.	" variegated.	Rhododendrons, best sorts.
Cedrus deodara.	Junipers in large variety.	" hybrids.
" Libani.	Picea Pinsapo.	Red Cedars 6 to 9 ft.
Chesnuts, scarlet.	" Fraseri.	Portugal Laurels.
Cryptomeria japonica	Pinus excelsa.	Yew, Irish, 3 to 7 ft.

Also very fine Specimen Standard Portugal Laurels and Rhododendrons. Indian Azaleas and Greenhouse Rhododendrons, for which we received first prizes last year, are grown very extensively. Catalogues may be had on application; also the Tree and Shrub Catalogue.

H. LANE & SON, The Nurseries, Great Berkhamsted.

GRIMSTONE'S HISTORY OF AN EGYPTIAN PEA, discovered amongst others by the Committee of the British Museum, in a Vase presented to them by Sir Gardener Wilkinson, the Egyptian Traveller. Three were presented to Mr. WM. GRIMSTONE by Mr. T. I. Pettigrew, who assisted in opening this relic of the time of the Pharaohs, being 2844 years old. The growth of this Pea is different to those of this country; the taste is unequalled, they boil much greener than ours, and so prolific, being planted thus . ˙ . ˙ . 8 inches apart. The 2*s.* 6*d.* bag will produce enough for a small family. They require no sticks, and the bloom hangs in clusters. Remember the only genuine is sold in bags, 2*s.* 6*d.*; three times the quantity, 5*s.*; seven times the quantity, 10*s.* Each bag is signed and sealed by WILLIAM GRIMSTONE, Herbary, Highgate; every bag contains the only method of cultivating them.—Depôt, 52, High Street, Bloomsbury, London Eye-snuff and Herb Tobacco Warehouse, 3*d.* per ounce.

GEORGE SMITH has much pleasure in offering the undermentioned strong Plants, ready for delivery about the 20th of April, 1855, feeling the greatest confidence in recommending them as possessing first-rate qualities:—

VERBENAS.

BOULE DE FEU (Young), bright orange scarlet, with conspicuous lemon eye; pip large, of fine form, compact truss, of good size, the habit excellent, a most profuse bloomer, the finest scarlet ever offered. First class certificates at the National, Royal South London and North London Floricultural Societies.

LORD RAGLAN (Banks), crimson scarlet, large lemon eye, pip and truss large, of fine form. This will be found a noble variety.

EMPRESS (Smith), pure white, with conspicuous rosy purple centre, pip and truss large, smooth and compact. One of the very finest of the light varieties.

MRS. M'NIEL (Smith), brilliant rose with large lemon eye, truss and pip large, of exquisite form, and very beautiful. In the style of Beauty of Hornsey.

VIOLACEA (Smith), intense violet, with a very conspicuous large white eye, pip and truss large, of good form. This flower will be found most remarkable and beautiful, either for bedding or exhibition. It is something in the way of M. Paquin, with the colour much more intense, and a fine free grower.

SILISTRIA (Smith), pale lilac, shaded with rose, very large and compact. First class at the Royal South London Horticultural Society. The set of six for 24*s.*, or 5*s.* per plant.

FUCHSIAS.

The following four Fuchsias are fine show flowers, plants of good growth, and very free blooming kinds that must be grown in all good collections:—

OMER PASHA (Smith), tube short and stout, sepals well reflexed, of bright waxy crimson scarlet, corolla deep violet purple, large, of good shape, fine habit, free in growth and profuse bloomer. A fine plant for exhibition. 7*s.* 6*d.*

ORLANDO (Smith), dark tube and sepals reflexed, with an intense dark corolla. 3*s.* 6*d.*

CORONET (Smith), white tube and sepals, corolla violet, good shape, very free. 3*s.* 6*d.*

NIMROD (Smith), white tube and sepals, corolla light purple, good form. Plant of strong growth, and a very free bloomer. 3*s.* 6*d.*

SCARLET GERANIUMS.

BEAUTY OF COMB BANK, intense scarlet, eye white, pips large and circular, truss very large, dwarf habit, with horseshoe foliage. A first class bedding variety. 5*s.*

CHEPSTEAD BEAUTY, fiery crimson scarlet, extra large and fine, foliage very beautiful, habit dwarf, and free bloomer. One of the finest scarlet Geraniums ever offered. 5*s.*

CERITO, salmon rose, truss and pip large. A novel and pleasing variety. Was exhibited at the National Floricultural Society, where the judges would have awarded it a first class certificate had the plant been exhibited. 5*s.*

PETUNIA.

SINGULARITY (Smith), a novel and striking variety, corolla two-thirds downward bright green, throat rose, flower extra large, the habit of Prince Albert, a pleasing variety. 5*s.*

Choice Verbena Seed, 2*s.* 6*d.* per packet.

A Priced and Descriptive Catalogue of first-class Verbenas, Geraniums, Fuchsias, Hollyhocks, Dahlias, Chrysanthemums, and Petunias, will be forwarded in exchange for one stamp.

Tollington Nursery, Hornsey Road, Islington, London.

AGRICULTURAL SEEDS, MEADOW & PASTURE GRASSES, &c.

PETER LAWSON AND SON, of Edinburgh and London, the Queen's Seedsmen, Nurserymen, and Wood Foresters; and to the Highland and Agricultural Society of Scotland, beg to intimate to their English Customers and the Public that they are now sending out FARM SEEDS of every description, saved from genuine stocks, and for which they respectfully solicit orders.

Also Garden Seeds, Flower Seeds, Garden Implements, Draining Tools, and everything connected with their trade. Catalogues will be sent on application.

London Branch, 27, Great George Street, Westminster.

P. L. & S. are always able to recommend experienced Bailiffs, Gardeners, and Foresters.

PERMANENT PASTURE.

H. R. SMITHE, of Eastling, Faversham, Kent, is now prepared to send out his mixtures of the NATURAL GRASSES, PERENNIAL CLOVERS, &c., &c., to lay down Land to Permanent Pasture, at 25*s.* per acre, allowing three bushels to the acre, carriage free. Mixtures for Lawn, or any other purpose, or the sorts separate. Most of the species of Grass are collected by the Advertiser, and he will bestow the greatest attention in selecting such as shall constitute mixtures specifical to the soil, purpose, &c., of each buyer.

GRASS SEEDS.—CARRIAGE FREE.

PERMANENT PASTURE GRASS.—*The very best Selections can be obtained from* William E. Rendle & Co., *Seed Merchants, Plymouth,—all new and carefully selected, from 24s. to 30s. per acre.*

ORNAMENTAL LAWNS, PLEASURE GROUNDS, &c. The choicest varieties for producing a fine sward for Lawns and Pleasure Grounds can be procured from William E. Rendle & Co., Seed Merchants, Plymouth, at 18*s.* per bushel, 2*s.* 6*d.* per gallon, or 1*s.* per lb.

RENOVATING GRASSES—for sowing over land deficient of plant—can be obtained at 9*d.* per lb.

A complete descriptive List of Grasses will be found in "Rendle's Farming Price Current," *and some valuable Tables, and other information relative to the best varieties for certain Lands and Situations.*

Apply to Wm. E. Rendle & Co., Seed Merchants, Plymouth.
Established Seventy Years.

NEW SEEDS, CARRIAGE FREE.

Prices of all kinds of Agricultural Seeds will be found in Rendle's "Farming Price Current and Agricultural Directory," just published.—Apply to
William E. Rendle & Co., Seed Merchants, Plymouth.

FARM SEEDS.

W. DRUMMOND AND SONS have implicit confidence in recommending the following Seeds:—

PERENNIAL RYE-GRASS, from the most select growths, and perfectly clean.

ITALIAN RYE-GRASS, direct from Lombardy, and through the same gentleman in that country who has for several years been employed by us in collecting those fine parcels which have hitherto given so much satisfaction to our customers.

GRASSES FOR PERMANENT PASTURE.—*Having been among the first to recommend the use of the* Natural Grasses *in the formation of* Permanent Pasture, *the subject has occupied a large share of our attention. We have carefully noted the species composing the best Natural Pastures, and the results of combinations in culture under varied circumstances of soil and situation; and, as the result of our observations, as well as from the great satisfaction our selections have given, we feel warranted in recommending, in addition to the Grasses usually sown, a variety of such species as are known, not only to yield the greatest bulk of herbage, but the largest amount of milking and feeding properties, varying those species, and the proportions of each, according to the nature of the land to be laid down.* From the increased demand, we are enabled to charge a lower price than formerly. An excellent assortment, and allowing a *liberal supply* of Seeds, may be had at from 24*s.* to 26*s.* per statute acre.

TURNIP, in all the leading varieties, saved by ourselves from full-formed Bulbs.

VETCHES (or TARES), large broad-leaved, a very superior sort.

Priced Lists of the above, with every other description of Farm Seeds, may be had post free on application.

Free Delivery.—All Parcels of Seeds above 2*l.* value (with the exception of Grain and Vetches), delivered free in London, Liverpool, Hull, Newcastle, Belfast, Londonderry, Aberdeen, Inverness, and to all the Stations along the Lines of the Caledonian and North British Railways, &c.

W. Drummond & Sons, Seed and Implement Warehouse, Stirling, N.B.

GRASS AND AGRICULTURAL SEEDS.

THOMAS GIBBS AND CO., the Seedsmen to the Royal Agricultural Society of England, beg to inform their friends and agriculturists generally that they are now prepared to supply the undermentioned in any quantities required.

Mixtures of Grass Seeds for laying down land to permanent Pasture and Meadow; Irrigation or Water Meadow Mixtures; Upland Sheep Walk Mixtures; Park and Field Lawn Mixtures; Renovating Mixtures for old Swards; Garden, Lawn, or Grass-plot Mixtures; various Permanent Grass Seeds supplied separately to order; Mixtures for one year's lay, do. for two or three years' lay (commonly called "seeds").

CLOVERS.—Red or broad leaved, white or Dutch, Red Suckling, Alsike or Hybrid, Trefoil, Cow Grass or Perennial.

RYE-GRASSES.—Italian (very fine), Annual, improved Perennial, and other kinds.

CARROTS.—Large White Belgian, large field, Altringham, Yellow Belgian, long Orange or Surrey.

PARSNIPS.—Gibbs' large Guernsey Cattle, common large.

MANGOLD WURZELS.—Long Red, Orange or Yellow Globe, Red Globe, long Yellow.

CABBAGES.—Large Drumhead Cattle, Thousand headed.

TURNIPS.—Purple-top Swedes, Green-top Swedes, Skirving's Swedes, Green-top Yellow Hybrid, Red-top Yellow Hybrid, Globes or Rounds, Tankard's sorts, Kohl Rabi.

Lucerne, Broom, Furze or Gorse, Field Parsley, Rape, Seed Barley sorts, Wheat sorts, Rye, Sainfoin, Tares, White Mustard, White Silesian Beet, Peas, Potatoes, and all other seeds for the farm.

KITCHEN GARDEN AND FLOWER SEEDS, including all the new and most approved varieties. Assortments made up to suit different sized gardens, or to any given amount.

Priced Lists of both Agricultural and Garden Seeds sent free by post on application to Thomas Gibbs & Co., Corner of Half-Moon Street, Piccadilly, London.

CLOVER SEEDS.

GENUINE NEW CLOVER SEEDS *can be had at the lowest market prices of* JOHN SUTTON & SONS, Seed Growers, Reading, Berks.

SUTTON'S LAWN GRASS SEEDS,

At the Crystal Palace, Sydenham.

SUTTON AND SONS *have had the honour of supplying to the Crystal Palace Company the Grass Seeds by which so many acres of Arable Land have been converted into the beautiful Park and Lawns, now so much admired at Sydenham.*

The following letter has been received, besides many others:—

From Professor Lindley, Horticultural Society, 21, Regent Street, London.—"We have already made trial of your Lawn Grass Seeds, and it is only justice to say that they have proved the best we have sown for many years."

Price 1*s.* per lb.; 2*s.* 6*d.* per gallon; or 20*s.* per bushel. Quantity required for forming new Garden Lawns, 2½ bushels, or 50 lbs.

Address John Sutton & Sons, Seed Growers, Reading, Berks.

IMPROVEMENT OF GRASS LANDS.

SUTTON'S RENOVATING GRASS SEEDS FOR IMPROVING OLD PASTURES.—Great improvement may be effected by sowing 8 to 12 lbs. per acre of Sutton's Renovating Seeds, which consist of Perennial Clovers and Grasses of the finer kinds for improving the bottom.

An increase of several Tons of Hay per acre has been thus effected on many Meadows and Upland Pastures. The Seeds should be sown early.

The drought of last summer having caused partial failures in the ordinary Grass and Clover Leys, Sutton's Renovating Grass Seeds may be sown with great advantage *in all such cases.* Price reduced to **9d.** per pound.

Sutton & Sons *also supply Grass Seeds for laying down Land to Permanent Pasture at a moderate expense, the sorts being selected in accordance with the nature of the soil to be laid down, particulars of which may be obtained by post.*

Goods delivered Carriage Free by Rail.

Address John Sutton & Sons, Seed Growers, Reading, Berks.

ESTABLISHED ABOUT HALF A CENTURY.

AGRICULTURAL SEEDS OF THE FINEST SELECTED STOCKS.—*As the quantity of Mangold, some of the Turnips, &c., are found not so scarce on the market as was expected at the close of harvest, we submit our present prices, in which several will be found lower than quoted in our Spring Catalogue.*

PERMANENT PASTURE AND OTHER GRASSES.—Our Mixtures for Permanent Pastures will be found equal to any which are supplied. Prices per acre, according to the nature of the soil, 24*s.* to 34*s.* Wholesale Prices of Grasses and other Seeds to the trade on application.

Finest Mixed Lawn Grasses, per lb. 1*s.*, or 4*s.* 6*d.* per peck.

☞ Goods Carriage Free (not under 20*s.*) to all the London termini, or any station on the Colchester and Norwich line.

BASS AND BROWN, Seed Establishment, Sudbury, Suffolk.

HEATHS AND EPACRISES.

MESSRS. YOUELL AND CO., in offering the following, beg to say that the whole are very healthy and well grown; those marked * are set well for flowering.

ERICAS.—Strong bushy plants in 48's at 12*s.* per dozen varieties:—Aristata vittata, *aggregata, bicolor, *Cavendishi, Coventryana, *daphnoidea, *denticulata moschata, *echiflora, *grandinosa, *hyemalis, hybrida, hyacinthiflora, Linnæoides nova, Metulæflora bicolor, *propendens, *propendens tubiflora, *pyriformis, *rubens, *Scabriuscula, *Sindryana, *Ventricosa breviflora, *V. coruscans, V. curta rubra, *V. densa carnea, *V. fasciculata rosea, V. fasciculata superba, V. fasciculata longiflora, *V. hirsuta, V. perspicuoides, *V. superba, *V. tumida, *V. tenuiflora, Verticilla *vestita fulgida, *viridiflora, Westphalingi, *Wilmorea superba.

The above are all dwarf bushy plants, and can be supplied to the trade at the usual discount in large quantities.

ERICAS, in large and small 60's, at 9*s.* per dozen varieties:—Archeriana, ampulacea, amp. carnumbrata, amp. rubra, aristata major, Bandoniana, Cavendishi, cerinthoides coronata, Cliffordi, *Colorans, daphnoidea, Devoniana depressa, denticulata moschata, elata, eweriana, eximia, exurgens coccinia, *gracilis, *grandinosa, grandis Hartnelli, *hyemalis, hybrida, hyacinthiflora, longiflora, Linnæoides superba, Metulæflora bicolor, *ovata, *perspicua nana princeps, *propendens, *prop. tubiflora, primuloides retorta major, Savilliana, Shannoniana, do. Turnbull's variety, *Sindryana, splendens, sulphurea, tricolor, tricolor rubra, T. Wilsoni, trossula rubra, Vent. alba, V. alba tincta, V. Browni, V. carnea, V. coccinea minor, V. conspicua, V. dependens coccinea, V. fasciculata longiflora, V. f. rosea, V. globosa, V. grandiflora (Storey's), V. hirsuta, V. magniflora, V. perspicuoides, Vernix coccinea Vernoniana, Vern. superba, Verticillata, Vestita carnea tenuiflora, Vest. coccinea, Vest. coc. tenuiflora, Vest. fulgida, Vest. rosea, Westcotti, Westphalingi, Wilmorea superba, Walkeri.

These are admirably adapted for specimen growing, being of the proper size to start with; the trade may also be supplied at the usual discount per 100 plants.

EPACRISES, in large 48's, fine plants, 12*s.* per dozen; ditto in large 60's and small 48's. The following varieties at 9*s.* per dozen varieties; those marked with an asterisk are set with flower buds:—*Alba penduliflora, ardentissima, autumnalis, *Campanulata alba, *C. maxima, C. grandiflora, Copelandica, *Carnea, *Ceræflora, Coruscans, delicata, densiflora, *densiflora incarnata, *elegantissima, Fairbarniana, *formosa, grandiflora, hyacinthiflora candidissima, hyacinthiflora rosea, *Hopeana, impressa, *imp. alba, *imp. magna, *imp. rosea magna, *lunata, magnifica, miniata, *nivalis, *nivalis grandiflora, *ornata, purpurascens, rubra grandiflora, *sanguinea, *splendida, Tauntoniensis, *variabilis.

This List comprises nearly all the varieties in cultivation. As a winter flowering plant the Epacris is eminently useful; it is also easily managed. The usual discount to the trade per 100 plants. We beg to refer to our advertisement of March 10, where will be found enumerated Coniferæ, Choice Greenhouse, and Hardy Plants, &c. &c.

	s.	*d.*

Youell & Co., Royal Nursery, Great Yarmouth.

NEW BEDDING GERANIUM.

GAINES' SCARLET UNIQUE.

N. GAINES begs to inform the nobility, gentry, and trade in general that he can supply strong healthy plants of the above beautiful variety. In habit it is like Rollisson's Unique, producing magnificent trusses of brilliant scarlet flowers. It was exhibited at the Chiswick and Royal Botanic Horticultural Shows, where it was considered a great novelty, and well adapted for bedding purposes. Price 5*s.* per plant; when three are taken, a fourth will be sent to compensate for carriage.

A Descriptive List of his large Collection of Pelargoniums, Show and Fancy varieties, also Stove, Greenhouse, and Hardwooded Plants, may be had post free, by applying at the Nursery, Surrey Lane, Battersea, Surrey.

SPLENDID NEW HOLLYHOCKS.

G. SMITH respectfully informs the admirers of the HOLLYHOCK that the following are Seedlings of great merit, and cannot fail to give entire satisfaction. They were raised by Mr. Parsons, the grower of Joan of Arc, and other fine varieties. To be sent out about the middle of April, 1855, in strong healthy plants.

	s.	*d.*
Eclat, yellow and buff, a nice full flower	3	0
King of Yellows, large, of fine form, flower full, extra fine yellow	7	6
Marchioness, flesh or blush, very double and close, fine for exhibition	5	0
Monarch, a true salmon, very large and fine shape ...	7	6
Mr. Adams, dark salmon pink, a noble show flower ...	5	0
Pearl, blush white, large and distinct	5	0
Pillar of Roses, a beautiful bright rose, a splendid spike, the finest border flower yet offered, and a most attractive show flower	5	0
The Alma, cherry rose, distinct, fine shape	5	0
White Unique, very close and double	3	6
Sarah, a splendid large rose, fine form and spike	5	0

Tollington Nursery, Hornsey Road, Islington, London.

GERMAN ASTER SEED, all saved from the finest Globe varieties, ever yet exhibited, and which have surpassed all others in cultivation for their immense size and distinct colours, 1*s.* per packet.

SWEET WILLIAM SEED saved from 50 of the choicest and most superb varieties, 1*s.* per packet.

ANTIRRHINUM SEED saved from all the finest shaped and best varieties, 1*s.* per packet.

SUPERB HOLLYHOCK SEED saved from all the best named flowers, 1*s.* per packet.

SCARLET GIANT BROMPTON STOCK, extra fine, 1*s.* per packet.

VERY SUPERIOR FIMBRIATA PRIMULA SINENSIS SEED, saved from six distinct varieties of the largest and most superb plants ever grown, 2*s.* 6*d.* per packet.

PANSY SEED, a few packets from selected varieties, 1*s.* per packet.

POLYANTHUS SEED, fine mixed, 1*s.* per packet.

CROWN GOURD, or CUSTARD MARROW; this variety is the most delicious of all the Marrows grown, 1*s.* per packet.

AQUILEGIA, or COLUMBINE, of 12 distinct varieties, 1*s.* per packet.

Any three packets of the above (except the Primula) sent post-free on receipt of 2*s.* 6*d.*, or the Primula included with two other packets, for 3*s.* 6*d.*, in cash or penny postage stamps by

EDWARD TILEY, Nurseryman, Seedsman, and Florist,
14, Abbey Church Yard, Bath, Somerset.

CHARLES TURNER begs to recommend the following Seeds:—

SABBATIA STELLARIS.—This beautiful Greenhouse Annual was raised at the Royal Gardens, Frogmore, from seed received from Texas, and was exhibited at the Horticultural Society's July Show, at Chiswick, and was awarded a First Class Certificate. It is of a deep rose colour, with a yellowish-green eye, and sweet-scented. It should be grown in a mixture of half leaf-mould, with the other half comprised of light peat, loam, and silver sand, and sown in a little heat. 2*s.* 6*d.* per packet.

NEW CUCUMBER, "WARD'S IMPROVED SION HOUSE," superior either to the "Improved Sion House" or "Lord Kenyon's Favourite," for winter use. Mr. Ward, of Prospect Hill, Reading, who raised it, writes—"I can strongly recommend it as the best winter sort I ever met with; and it always swells out, not plumber's iron fashion, as is the case with many sorts, and equal in bearing to Lord Kenyon's Favourite, generally throwing three or four fruit together." Price 1*s.* 6*d.* per packet.

	s.	*d.*
HOLLYHOCK SEED, saved from the newest and finest sorts in cultivation, per packet	2	6
" " smaller packets, each	1	6
DAHLIA SEED, saved from the very best exhibition flowers, per packet	2	6
" " smaller packets, each	1	6
CALCEOLARIA, extra quality, per packet...	2	6
CINERARIA, extra quality, do.	2	6
HEARTSEASE, from best show flowers, do.	2	6
" " " smaller packets, each	1	6

The new white bedding Calceolaria "Purity," the entire stock of which is in Charles Turner's hands, also his new Dahlias, new Verbenas, &c., will shortly be advertised.

Royal Nursery, Slough.

NEW STRAWBERRY—CAROLINA SUPERBA.

JAMES KITLEY begs to inform his friends and the public that he has succeeded in raising from Seed a New Strawberry, the qualities of which have long been a desideratum. It possesses the excellent flavour of the old Carolina, the fruit as large as the British Queen, with all the combined good qualities of productiveness, hardiness of plant, dwarf habit, &c., which tend to make it a general favourite. It was exhibited at the Chiswick Horticultural Exhibition, and obtained a First-class Certificate.—See *Gardeners' Chronicle*, July 15, 1854.

Dr. Lindley's Opinion.

"J. K., the Strawberry which you have named Carolina Superba partakes of the flavour of the old Carolina, but the fruit was bruised by carriage, so that the paper which accompanied the Strawberries was saturated with juice, and this juice dried on the paper like syrup—sweet, adhesive, glossy, and brownish coloured. Strawberry juice does not usually possess these properties."—See *Gardeners' Chronicle*, July 1, 1854.

The undermentioned gentlemen having had opportunities of seeing it growing, and also tasting the fruit, have kindly permitted their Testimonals to be placed before the public:—

"Your Carolina Superba Strawberry, which I saw last summer in bearing, appeared a very hardy and productive kind, with the flavour of the old Carolina, and will prove an acquisition to this class of fruit.

"John Spencer, Marquis of Lansdowne's, Bowood."

"I feel much pleasure in giving my opinion of your Seedling Strawberry, Carolina Superba. Having had frequent opportunities of seeing it growing and tasting the fruit, I consider it hardy, of good habit, short foliage and fruit-stem. In flavour and crop, I know none that will surpass it; and feel assured it will do you credit, and give satisfaction to all who may purchase it.

"James Pond, Devonshire Cottage, Bath."

"The Seedling Strawberry, named Carolina Superba, that I saw in fruit in your nursery last season, appeared to me to be a first-class variety of dwarf foliage, a profuse bearer, and flavour excellent. I have no doubt it will give the greatest satisfaction to all who may possess it.

"D. Butler, Widcombe Nursery, Bath."

Strong well-rooted PLANTS are now ready, at 3*l.* per 100, 10*s.* per dozen, or 12*s.* free by Post.

Lyncombe Vale Nursery, Bath.

IPOMŒA RUBRO CÆRULEA.—Seed of this exceedingly beautiful Climbing Annual being now obtainable at a moderate price, all cultivators of flowers having a greenhouse or wall with warm aspect are advised to include it in their spring selection.—Seed supplied to Seedsmen and Nurserymen only, by GEORGE ROBERTS, 32, Moorgate Street, London.

NEW PLANTS IN FLOWER.

MESSRS. E. G. HENDERSON AND SON beg to announce that the following plants are now in flower, and may be viewed at their nursery :—

Camellia Jenny Lind	Rhododendron Pontica coccinea
" Marie Antoinette	Camellia de la Reine
" Ariosto	" Faustine Lechi
" Mathotiana	" Americana
" alba pleno of Casoretti	Azalea Admiration
" Mary Ann (new American variety)	" Narcissiflora
Azalea Criterion	Cyclamen Persicum, new collection
" Juliana	Camellia Gloria della Isole
Cyclamen Atkinsi	Barroma
Camellia Rapalling	Rhododendron, new seedling
Rhododendron Fergusoni	Genestyllis macrostegia (Fuchsioides).

Rhododendrons species from Sikkim flowering for the first time in England, small Plants with three trusses, each truss having 18 flowers, colour canary-yellow.

NEW PLANTS

To be sent out in May (orders for the Fuchsias received after April 7th will only be executed after the earlier orders are sent off, when it is probable one or two varieties may be too small to travel with the rest) :—

HYDRANGEA HORTENSIS, flore pleno, 10*s.* 6*d.*
PHLOX QUEEN VICTORIA, 5*s.*
DAHLIA EMPEROR FRANCIS JOSEPH (variegated foliage), 10*s.* 6*d.*

SHRUBBY BEDDING CALCEOLARIAS.

Brunette	7*s.* 6*d.*	Norma	7*s.* 6*d.*
Coreggio	7 6	Red Rover	7 6
Maggiore	7 6	Vezzosa	7 6
Miania...	7 6	Wildfire	7 6

Or the set of eight varieties, 2*l.* 2*s.*

With the permission of Mr. C. Turner they will offer his new CALCEOLARIA PURITY (the best white bedding variety) at 7*s.* 6*d.* each, or with the above set, 2*l.* 7*s.*

FUCHSIAS.

Queen Victoria (Story)	10*s.* 6*d.*	Lady of the Lake (Story)	10*s.* 6*d.*
Prince Albert (Banks) ...	10 6	Water Nymph (Story) ...	10 6
Perrugino (Story)	10 6	Raffaelle (Story)	10 6
Empress Eugenie (Story)	10 6	Mrs. Story (Story)	10 6
Ranunculæflora (Story)...	21 0	Snowdrop (Story)	10 6

Or the set of ten varieties, 4*l.* 4*s.*; or without Ranunculæflora, 3*l.* 3*s.*

FUCHSIA BANKS' FAVOURITE (Banks), 10*s.* 6*d.*

For full particulars of the above see back numbers of this Paper.

NEW SEED CATALOGUE,

With full description of all the New Annuals, forwarded post free on application; each article is priced, the height and colour given, with various information to guide the cultivator. A list of the choicest sorts is also selected and brought together in a separate List.

THE NEW SPRING CATALOGUE

Will shortly be published and forwarded post free on application. Parties wishing for the same will have their names booked for it, to be sent as soon as ready.

A COLOURED PLATE,

Composed of a group of Nine new Flowers belonging to the Stove, Greenhouse, and Garden. It will be sufficient to say that it was taken by Mr. Andrews, the floricultural artist, to insure their accuracy, and which are now in course of preparation under his superintendence; any one wishing for the same will have their names booked for it, to be sent them when finished, by forwarding 12 postage stamps; and if ordered in time will be stitched-in and sent with their new Spring Catalogue. This notice also applies to any nurseryman that may wish to have the Plate.

Messrs. E. G. HENDERSON & SON having purchased of the late W. Story, Esq., of Newton, in the county of Devon, for ONE HUNDRED GUINEAS, all Seedling Fuchsias with white Corollas, a new feature in this tribe introduced by him, and in consequence of an advertisement appearing in the *Gardeners' Chronicle* from Messrs. Lucombe, Pince, & Co., of Exeter, offering two new Fuchsias similar in character to those purchased of the late Mr. Story, it was thought necessary, after a written communication with that gentleman, for one of the firm to make further inquiries about them, and in consequence Mr. ANDREW HENDERSON went to Exeter and Newton, where he was informed by a jobbing gardener at Newton that he had received in the month of November last Seven Pounds for them after (as the said jobbing gardener stated) he had been offered £20 for them by a nurseryman in London, but whose name or address he did not know.

Messrs. E. G. H. & Son give the above explanation in consequence of numbers of their customers having ordered plants at higher prices than are now quoted. This reduction is made in consequence of information which they have received that leaves no doubt on their minds but that those to be sent out by Messrs. Lucombe, Pince, & Co. are similar in character to those purchased of Mr. Story.

TO NURSERYMEN, SEEDSMEN, ETC.

Messrs. E. G. HENDERSON & SON having had (through their customers), a Seed Catalogue brought under their notice, and which seems to have been distributed throughout the whole of their connection, published by Messrs. Rollisson & Son, Nurserymen, Tooting, near London; and on referring to the same they find that all the Hardy Annuals from Nos. 1 to 308, the Half-hardy Annuals from Nos. 309 to 479, Hardy Biennials and Perennials from Nos. 480 to 660, and the Greenhouse Plants and Tender Annuals from Nos. 661 to 741 (appear to) have all been copied from their lists, with the full descriptions of colour, height, treatment, and other information, even the numbers attached to each article correspond with the strictest accuracy. The only alteration is that no prices are attached, whereas, in the original catalogue every article is priced.

Messrs. E. G. H. & SON beg to say, that as they are at some considerable expense and trouble in preparing and issuing their catalogues throughout the year, they now give notice that in future they shall consider it very disreputable in any parties copying them in the style above alluded to, unless the source from which they derive their information is published at the time, or otherwise communicating with them previously to copying the same.

Wellington Nursery, St. John's Wood, London.—April 14.

FULLER'S EARTH WORKS, CHART LODGE, REIGATE, SURREY.

NOTICE.—SILVER SAND.

GAWKROGER AND HYNAM beg to inform the Nobility and Gentlemen, Gardeners, Nurserymen, Florists, and Seedsmen, that they are prepared to supply them with the REIGATE SILVER SAND, which is known by its superior sharpness and fine quality, and is much used in the Propagation and Growth of Greenhouse Plants, &c. It will be sent in fine sacks and delivered to any of the Railway Carriers, or Wharfs in London, in not less than ½ ton lots of 10 bushels, at the rate of 40*s.* per ton. Parties requiring lots of 4 tons and upwards can have the Sand delivered loose or in bags at the Bricklayers' Arms Station, or within five miles of the same, at a very low price.—For further particulars, apply at the Offices of JAMES GAWKROGER, Union Street, Halifax, Yorkshire; and JOHN HYNAM, 7, Prince's Square, Wilson Street, Finsbury, London.

MEADOW AND PASTURE GRASS SEEDS.

GEORGE GIBBS AND Co., 26, Down Street, Piccadilly, beg to announce that their Mixtures of Grass Seeds are now ready for delivery at the following prices :—

Mixtures for laying Land down to permanent Grass, for light, heavy, and other soils (allowing 2 bushels and 12 lbs. to the acre) ... ... 30*s.* per acre.
Mixtures for Park or Field Lawns (allowing 2 bushels and 12 lbs. to the acre) ... ... 32*s.* per acre.
Mixtures for improving and renovating old Grass Land, 1*s.* per lb.
Mixtures (finest sorts) for forming Lawns... ... 1*s.* 3*d.* per lb.

These Seeds are all new, and have all been properly cleaned and their growing properties fully tested. Directions for sowing accompany the seed.

G. G. and Co.'s New Priced AGRICULTURAL CATALOGUE is now ready, and will be forwarded free on application.

GEORGE GIBBS & CO., SEEDSMEN,
26, Down Street, Piccadilly, London.

Seed Establishment, High Street, Maidstone, April 14.

SEED POTATOES.

ALSTONE KIDNEY.—*This is perfectly distinct from any other Potato. It is an astonishing cropper, and the tubers are of a large size. It keeps well, and is good flavoured, and is altogether an excellent and profitable variety. 2s. 6d. per peck, or 9s. per bushel.*

PRINCE OF WALES.—*This is an early round white Potato, which, for a general crop, can be highly recommended. It is a sort that gives the most complete satisfaction to every one who sows it. 2s. 6d. per peck, or 9s. per bushel.*

J. C. WHEELER & SON, Gloucester, Seedsmen to the Gloucestershire Agricultural Society.

ESTABLISHED IN THE EARLY PART OF THE 18TH CENTURY.

BOSSOM'S CHAMPION OF ENGLAND CELERY.

THE finest Celery yet introduced, beautifully white, very crisp and solid, and withstands a greater amount of frost than any other known variety; it has been blanched in the ground 3 feet.—To be obtained of T. F. WINSTANLEY, Seedsman, 28, Market Place, Manchester, price 2*s.* 6*d.* per packet; prices to the trade on application.

NEW FUCHSIAS.

STEWART AND NEILSON are now receiving orders for their Twelve NEW FUCHSIAS, advertised in September last, which will be ready to send out on the 1st of May at the following prices, or 3*l.* for the twelve.

Mr. Ewart, dark	10*s.* 6*d.*	Mrs. E. Hill, light ...	7*s.* 6*d.*
Mr. D. Neilson, do. ...	10 0	Mrs. Gardner, dark ...	7 6
Mr. G. Lawrance, do.,	10 0	Miss A. J. Wright, do.	5 0
Miss France, do.... ...	10 0	Mrs. Maxwell, do. ...	5 0
Mr. Littledale, do. ...	7 6	Mrs. Perry, do.	5 0
Dr. Parr, do.	7 6	Mrs. Bouch, light ...	5 0

A remittance from all unknown correspondents.

Nurseries, Liscard, Cheshire, near Liverpool.—April 14.

YELLOW TANKARD SWEDE.—A superior new sort for early or late sowing	3	0	0
HARDY GREEN TOP YELLOW SWEDE	3	0	0

SUTTON'S LARGE YELLOW GLOBE MANGOLD WURZEL.

This is a superior stock of Mangold Wurzel raised from selected, large, finely-formed bulbs; it is more solid than other kinds, and perfectly hardy, not requiring to be stored or clamped in the winter. *W. D Briginshaw, Esq., of Taplow, near Maidenhead, who grew some of this kind from our Seed last season, has written to the Editor of the* AGRICULTURAL GAZETTE, *on 23d March last, stating that the Mangold he raised from Messrs. Sutton's seed, and which has been standing in an open field, where it was sown at the beginning of last May, is as sound and as good as it was in the autumn.* We have also received an order from a gentleman in the same neighbourhood who states that *his* Mangold, grown in a field near Mr. Briginshaw's, but not from our seed, is nearly all rotten.

PRICE OF SEED, 1*s.* per lb., or 5*l.* per cwt.

The common sorts of Mangold Wurzel may be had much cheaper.

GOODS DELIVERED CARRIAGE FREE.

To Farmers, Potato Growers, and Others.

JACKSON'S PATENT PREPARATION
FOR
PRESERVING POTATOES, WHEAT, AND OTHER SEEDS

From DISEASE, the RAVAGES of the SLUG, GRUB, and WIREWORM, in addition to which the CROPS are brought forward in HEALTH AND VIGOUR, and the yield is greatly increased, in proof of which the following extracts are given from numerous letters received by Mr. JACKSON.

EXTRACTS:—

"One of the fields of this farm, the property of MRS. STANBURY, was planted with Regents Potatoes in April last, some of which were prepared by you. The result now is, that the whole of the crop from the unprepared sets is thoroughly diseased, and hardly worth the trouble of taking up; while those raised by the side of them from the prepared sets are not only in a beautiful state of preservation from the disease, but the produce is much greater,—the Potatoes are more numerous than the others; indeed, if there were no such thing as the disease to be feared, it would be worth the trouble and expense of preparing the sets by your process, even for the sake of the improved crops. I shall certainly, for the future, prepare all my Potatoes for seed by your process; and I intend to adopt it for preserving my Wheat from the Smut.

"G. B. BAXTER.

"Belmont Farm, Eltham, Kent, August 28, 1854."

"Admiral Sir J. A. GORDON, K.C.B., Marlee House, Blairgowrie.

"SIR,—I have received your note of the 16th. The Potatoes that came here from England, prepared by Mr. JACKSON, were planted in a piece of new ground, and according to the directions sent by him along with them as to distance between the plants, &c. They came up well, with strong healthy stems; we have now taken the whole crop up, and there is not the slightest appearance of any disease amongst them. They are of large equal size and very prolific. There were long black unprepared Kidneys planted in the same patch, and a great deal of them are not fit for use, at least a third part are diseased. I hope Mr. JACKSON's process may be widely known, as it is a great boon.—I am, &c., JOHN SHANKS,

"Forester, Kildrummy Castle.

"Kildrummy Castle, Aberdeenshire, November 17, 1854."

"I am very much pleased with the result of the experiments I have made with your Prepared Potatoes; for I planted them without any manure, in ground where for several years I have hardly had a sound Potato, and I now find the crop perfectly free from disease, and in a very fine condition; while those of the same sort, unprepared, which were planted at the same time, and next to them, are diseased and eaten by worms.

"The Potatoes from the Prepared Seed were so remarkably good that I was induced to weigh them, and I found, to my great astonishment, that they were as 200 to 150 of the others, or about 25 per cent. in favour of your preparation.

"T. AUSTEN, Nurseryman and Seedsman.

"Blackheath, Kent, 24th August, 1854."

Sold by Messrs. CHARLWOOD & CUMMINS, Seedsmen, Covent Garden; and JOHN KERNAN, Seedsman, 4, Great Russell Street, Covent Garden; all Seedsmen and Chemists; and at the Patentee's, 18, Cannon Street, London Bridge, in Packets of One, Two, Three or Four Pounds, or in Bulk for the use of Farmers and Potato Growers.

London Agents for the sale of "HARTLEY'S PATENT ROUGH PLATE GLASS," 116 Bishopsgate Street Without.

LINGHAM BROTHERS, No. 170, Hampton Street, Birmingham, sole Manufacturers of the improved WOOD and ZINC MONOGRAPH, or LABELS for Garden Borders, Flower-pots, &c., in boxes of 100 each. The Zinc Labels are highly approved of for their lasting durability, can be written upon with the greatest ease, and when dry a permanent inscription is secured. Directions are sent with each box, including a bottle of metallic ink.—Sole Agents in London, Messrs. DEANE, DRAY & Co., Horticultural Implement Warehouse, 46, King William Street, London Bridge.

A RECEIPT FOR THE MILLION.

TO SET CAMELLIAS, with or without artificial heat, by a most simple means. Price 1s. 6d. by stamps—Direct, post paid, to R. KEELE, Practical Gardener, 46, Wellington Street, Woolwich.

HOW TO KILL RATS, MICE, AND MOLES BY HUNDREDS.—A Method will be forwarded with instructions for 30 postage stamps, which will destroy the above vermin quickly and without trouble. 1000 acres may be cleared for a few shillings.

GILBERT DYSON, Hoo, Rochester.

CRYSTAL GLASS SHADES for Alabaster and other Ornaments, and Preservation of Articles affected by Exposure, from 4d. each; whiter and 15 per cent. cheaper than any other house in England.

Bohemian Glass Warehouse, 18 & 19, Crown Street, Soho, 19 doors from the S.E. corner of Oxford Street.

THE CRYSTAL PALACE FLOWER BASKETS made to the original, and a variety of new and elegant Designs for Conservatory, Verandah, Drawing-room, &c., from 3s. 6d. upwards, by W. RICHARDS, WIRE-WORKER, &c., 350, Oxford Street, nearly opposite the Princess's Theatre. Conservatories fitted up, Aviaries, Bird-cages, Flower Stands, and every description of Wire work. Game and Garden Fencing of the best description.

N.B. Holland, Venetian, Wire, and all kinds of Sun shades, and Window Blinds of best quality.

TRELOAR'S COCOA-NUT FIBRE MANUFACTURES, consisting of MATTING, MATS, MATTRESSES, BRUSHES, NETTING, HORSE-HAIR, and BRISTLE SUBSTITUTE, are distinguished for superiority and excellence of workmanship, combined with moderate prices. Prize Medal both in England and America at the Exhibition of all Nations.

T. TRELOAR, Cocoa-nut Fibre Manufacturer, 42, Ludgate Hill, London.

TO COUNTRY GENTLEMEN VISITING LONDON AND OTHERS.

A large and beautiful assortment of FOUNTAINS, Classical and Modern Figures, a variety of choice designs in Vases, with numerous other Ornaments for gardens, terraces, and pleasure grounds, are being offered at unexampled low prices, at 74, Borough Road, Southwark, near Blackman Street, Borough, London.

GARDEN VASES, FOUNTAINS, ETC.

THOMAS SOMMERVILLE, LANDSCAPE GARDENER, NURSERYMAN, SEEDSMAN, and FLORIST, Garden Road, St. John's Wood, London, begs respectfully to inform the nobility, gentry, and his patrons generally, that he has entered into arrangements with an eminent company in Scotland for the sole disposal in London of their highly ornamental and very durable Vases, Fountains, &c., samples of which may be seen at his grounds in the Garden Road, as above.

T. S. has much pleasure in being the first to introduce to the notice of the public a highly ornamental Vase, capable of resisting the most severe weather, and at little more than half the cost of any other possessing the same qualities; and he has no hesitation in stating that a more suitable Vase for the growth of plants cannot be manufactured.

DEANE'S WARRANTED GARDEN TOOLS.—Horticulturists and all interested in Gardening pursuits are invited to examine DEANE, DRAY, AND CO.'S extensive Stock of GARDENING and PRUNING IMPLEMENTS, best London-made Garden Engines and Syringes, Colebrook Dale Garden Seats and Chairs.

Averuncators	Gidney's Prussian Hoe	Pickaxes
Axes	Grape Gatherers and Scissors	Potato Forks
Bagging Hooks	Gravel Rakes and Sieves	Pruning Bills
Bills	Greenhouse Doors and Frames	" Knives, various
Borders, various patterns.	Hammers	" Saws

DEANE, DRAY, AND CO. are sole Agents for LINGHAM'S PERMANENT LABELS, samples of which, with their Illustrated List of Horticultural Tools, can be sent, post paid, to any part of the United Kingdom. Also, Wholesale and Retail Agents for SAYNOR'S celebrated PRUNING KNIVES, used exclusively by the first Gardeners in the United Kingdom.

DEANE, DRAY, & CO. (Opening to the Monument), London Bridge.

LANDSCAPE GARDENING, GARDEN ARCHITECTURE, AND GENERAL IMPROVEMENT OF DOMAINS, WOODS, PLANTATIONS, ETC.

CHARLES M'INTOSH, F.R.P.S., A.L.S., &c. Author of the "Book of the Garden," and other works on Horticulture, &c., late Curator of the Gardens of his Majesty the King of the Belgians at Claremont and Brussels, and latterly of those of his Grace the Duke of Buccleuch at Dalkeith Palace, begs to inform the nobility, and the proprietors of estates generally, that, in consequence of the numerous applications he has been honoured with for Plans and superintendence of all kinds of Garden Erections, Laying-out Grounds, the Management of Woods and Plantations, and other matters connected with Rural Economy, he has made arrangements which will enable him to dedicate his whole time and attention to these objects.

The practical experience of upwards of 40 years, both in Great Britain and on the Continent, and in a field of operation he believes more extensive and varied than has fallen to the lot of most individuals in his profession, will, he hopes, be sufficient guarantee to those who may honour him with their commands that they will be executed efficiently.

C. M. would particularly direct the attention of the public to his new and important improvements in Hothouse and Conservatory Building, which he flatters himself will in all cases secure economy, elegance, and fitness for the purpose, and of which examples can be referred to.

Address, Lugton, Dalkeith, N.B. After 1st of May, address Newcome Villa, Murryfield, Edinburgh.

PAGE AND CO.'s BLIGHT COMPOSITION.—Extra Strong, 4s. per gallon, sufficient to make four (Jars and Barrels extra); in Bottles, 1s. 3d. and 2s. 6d. each. Directions for application forwarded. 10 Gallons and upwards Carriage Free to London. Should be in the hands of all Plant and Fruit Growers. See *Gardeners' Chronicle*, March 3, 1855. It can now be obtained of

Messrs. F. & A. Dickson & Sons, 106, Eastgate Street, Chester, and 14, Corporation Street, Manchester
Ellis & Brown, Sudbury
Sutton & Sons, Reading
W. & G. Davison, St. Peter's Street, Hereford

N.B.—Other names will shortly appear, as the agents are appointed.

GERANIUM—"ENGLAND'S GLORY."

BAINBRIDGE AND HEWISON have purchased this beautiful bedding Geranium. The colour of the flower is pale flesh, or maiden's blush; the leaf of the horse shoe kind, and very glossy; the individual flowers are smooth, of great substance, and of exquisite form. It is an abundant bloomer, an exceeding large trusser, and throwing its flowers well above the foliage. It resembles much the Hydrangea, and is considered the best Geranium out for bedding or conservatory.

Plants in June, 1855, 5s. each. The usual allowance to the trade when three Plants are taken.—York Nurseries, April 14.

GRASS SEEDS FOR PERMANENT PASTURE, 24s. to 30s. per acre.
IMPORTED ITALIAN RYE-GRASS, 6s. per bushel.
PACEY'S PERENNIAL RYE-GRASS, 4s. 6d. to 5s. 6d. per bushel.
LAWN GRASS SEED, 1s. per lb.
TRUE PERENNIAL RED CLOVER, OR COW GRASS, 10d. per lb.—Delivered carriage free.
J. C. WHEELER & SON, Seed Growers, Gloucester, Seedsmen to the Gloucestershire Agricultural Society.
Established in the early part of the 18th century.

The Gardeners' Chronicle.

SATURDAY, APRIL 14, 1855.

THE mode of securing wall fruit against spring frosts is now engaging the attention of gardeners, as well it may, for, if the end of this present April should be at all like that of the last five or six, our gardens will again be deprived of their most valuable produce.

Wall trees, then, must be protected, and immediately; but in what way?—or rather, in which of the dozens that have been suggested? Should it be with canvas? or with netting? or with glass fronts? or with hay-bands? or coping boards? or Fir twigs? The best reply is that all will answer more or less if properly applied, and none will be efficient if care instead of judgment is all that the gardener can trust to.

What is the true object of this shelter? To keep the wind off? No. To keep the rain off? No. To keep trees warm? Certainly not. To keep the air away? No, no. It is simply and purely to guard against nocturnal radiation, or to stop driving sleet. Beyond this no purpose is served. Let us look at this from a general point of view.

Let A B represent the front of any wall, and B C a border on one side of it. When nocturnal radiation takes place, that is to say, loss of heat by the earth, the heat passes away into space in the direction of the dotted lines *a a a*, and in no other direction. In bright nights this takes place to a degree that is fatal to the blossoms of fruit trees. But the lines of radiation are intercepted by any object interposed between them and the sky, such, for example, as is shown at A D; and then the heat which flies off perpendicularly, being stopped at *b b b*, is immediately radiated back to *a a a*, so that what is lost by the earth at one moment being sent back again the next moment, the effect of radiation from *a* to *b* is nullified by the counter radiation from *b* to *a*. Such is the theory of radiation upon which the means of securing wall trees from night frosts wholly turns.

It is evident that in this case A D represents a coping, screen, or any other inclined body used for protection. Supposing it to be opaque, it is evidently immaterial whether it forms the usual angle with the wall, or is horizontal; but if it is composed of net-work, or any other open material, then it is equally clear that it should be hung at such an angle as will enable the meshes to form among them an unbroken roof when viewed from B C.

No better illustration of this principle can be given than that of Mr. HARRISON, formerly mentioned in our pages, and which we here reproduce without its explanatory letter-press. In this case the application of the above diagram to an excellent kind of shelter is self-evident.

A very little ingenuity is sufficient to show how

such a sloping screen can be made with other materials in a temporary manner. We content ourselves with pointing out one. The HARRISON screen admits light and air abundantly, and destroys radiation; that is its fundamental principle. Whether the effect is obtained with brown calico and woollen netting and neatly trimmed framework, or with far ruder materials and hedge-stakes, is of no great consequence to the crop, however much such rough contrivances offend the eye. The following scheme, which has been repeatedly tried with advantageous results, may be put up in any country place in a few hours. Let the accompanying diagram represent A B, a wall; B C, the border; and A D, the screen as before, seen endwise. Let A D

also represent a line of strings stretched from the top of a wall to C. Suppose haybands or strawbands, the rougher the better, are tied horizontally to A D at the places marked ✳, it is evident that, when looked at from below, A D will have the appearance of a close roof, and in reality will be so for the purpose of intercepting radiation. In fact it does roughly and imperfectly what the HARRISON screen does neatly and securely. Its fault is, that the slope A D does not keep off driving sleet sufficiently.

In all these schemes there is one important condition which is little thought of, although it makes the whole difference between success and failure. To retain warmth (or as we say to keep off cold) is not of itself enough to secure a crop of fruit. Precautions must also be taken to enable the flowers to "set." Nothing is done if that is neglected. We have seen most carefully and expensively executed contrivances wholly resultless owing to this simple matter not having been thought of. Their ingenious inventors could not divest their minds of the maxims of the "coddling school" of cultivation, and killed their children with kindness. In order that flowers may set, it is indispensable that they shall be exposed to all natural currents of air, short of storms, and to the freest access of insects, both which agencies are undoubtedly natural contrivances to ensure the dispersion of pollen. But when a plant is put under a close glass case, or bagged up in a tight canvas frame, or stifled by any similar scheme, no air finds free admission, no insects can visit the flowers, and the dispersion of pollen is practically arrested. Whenever close screens are used, then, the space between D and C in the diagram ought to be amply sufficient to allow abundant indraughts of air, and the visits of as many insect admirers as the flowers can attract. This is perfectly provided for in the HARRISON screen, as will be seen by comparing it with the diagrams.

IT is known to every one that the only reason gardens cannot be kept in beauty in great cities, especially such as London, consists in the impossibility of guarding them from the effects of smoke. Other inconveniences are susceptible of remedy; against smoke it is hopeless for a gardener to contend except at a cost that few care to incur. Lord PALMERSTON's Smoke Prevention Bill is however working so well, and has already purified some of the worst districts to such a degree, that the great metropolitan horticultural difficulty is rapidly diminishing. From Limehouse to Blackwall the atmosphere has become as pure as at Hammersmith, and if smoke inspectors did their duty, which they do not, the Isle of Dogs might even now become the site of a botanic garden.

River steamers, indeed, still continue to poison the air, and dwelling houses to assist them; but PRIDEAUX's furnace door, concerning which we hear the best accounts, promises to render the former smokeless, and Dr. ARNOTT's ingenious fire grate, now coming into general use, will by degrees enable Lord PALMERSTON's Act to be extended to dwelling houses, should their owners not find it their interest—as they surely will—to employ it without compulsion. Under these circumstances metropolitan or town gardening assumes new importance.

It is not, however, to be supposed that coal smoke is the only obstacle to gardening in the midst of acres of houses; other enemies are in the way, as fatal as smoke, but fortunately more easily guarded against. The first of these is the general dryness of the atmosphere. Wherever large areas are deprived of trees the air ceases to be charged with moisture, and vegetation languishes or perishes. Wherever trees abound, as in natural forests, the atmosphere is incessantly supplied with vapour by the insensible perspiration of their leaves, and luxuriant verdure is the result. A great city is therefore like a great desert, and equally incapable of supporting vegetation in the absence of artificial supplies of water. It is even worse, for the dry brickwork of houses is perpetually and powerfully absorbing the little vapour which does exist applicable to the purposes of vegetation. But in this country water is never wanting in cities, and refreshing showers can be administered at the pleasure of the gardener. All that his home-made rain is deficient in is that carbonate of ammonia which natural rain collects in its passage through the atmosphere. But this is a want which a very small amount of ingenuity can supply.

Another, though less universal, difficulty in town gardening consists in the general sterility of the soil in such places. Whatever its original quality may have been, and it was most commonly indifferent enough, it becomes in a few years utterly exhausted of all matters on which plants can feed, and no means are taken to restore or communicate fertility by manure. If Grass is mown, the mowings are removed and nothing supplies the nutritive matter they have abstracted; if leaves fall they are swept up and carried away; if the borders are decorated with annual or perennial plants, the gardener's first care is to cut off and remove their decaying leaves in order to make the place tidy. We may take our wretched London squares to be gardens of a peculiar kind. In the course of 30 or 40 years, during which we have known them, we never remember to have seen a single load of manure carted into even the best of them. The inhabitants trust to Providence, instead of their own outlay and superintendence; contract with somebody, at the lowest possible price, to "keep the square in order," that is to say to mow the Grass and sweep up the dead leaves; and there they stop. They would seem not to know that trees and Grass require to be fed as well as themselves. It would be as rational to trust to the action of a curreycomb alone for keeping

a horse in health. Luckily it does so happen that their great enemy soot renews a little the languid powers of the soil; were it otherwise these trees would disappear. That which is true of a square as it is, would be equally true of a garden properly so called; and more so, for ordinary garden plants usually demand a better soil than that in which trees contrive to exist.

When, therefore, we shall have lost our sooty atmosphere and begun again to garden, the first requisites will be water in abundance and manure. In their absence no skill can succeed; with them at command, no greater failure is possible than that which arises from ignorant gardening, which is just as bad in the country as in towns. Towns, indeed, will have this advantage—that they provide a degree of warmth and shelter which in the open country is unattainable. The only real impediments will be birds, cats, and other vermin. A man must, however, have very little skill who cannot keep off such visitors by means that shall not render his garden less enjoyable.

We presume that it is in anticipation of the advent of this new condition of London that the two little works mentioned at foot have been prepared.* We cannot, however, say much in favour of the second, which does not seem to have been written by a gardener, if we are to judge from the plants recommended for cultivation, and from sundry little symptoms which the practised eye has no difficulty in detecting. Gardeners do not talk of "Abderas of suffocated greens," or "Tantalian lakes," or "Stagyrian retreats," whatever those phrases may mean, nor would he have recommended such plants as Browallias, Cleomes, Hebenstreitias, Chænostomas, and Eutocas, as annuals for a town garden, or unattractive species like Nicotiana longiflora, Malva crispa, Catananche lutea, and Fedia dentata to be cultivated anywhere.

Mr. Paul's book, on the contrary, is that of a practical man, whose advice may be taken with confidence; and we anticipate that it will become, as it deserves, a general authority in suburban cultivation. We must, however, be permitted to doubt whether his selection of plants will continue to have weight with those who shall have purchased upon his advice such things as the following for decoration of London gardens:—Erigeron philadelphicum, Lathyrus *in variety*, Benthamia fragifera, Podocarpus coriacea, Sanguinaria canadensis, to say nothing of others whose names are unknown beyond the nurseries.

VEGETABLE PATHOLOGY.—No. LXVII.

296. Decoloratio (*Change of Colour*). Variegation not only differs in degree, according to the more or less imperfect formation of chlorophyll, but different shades may be combined in the same individual, as in a variety of crown imperial, where there are yellow, white, and green bands, but it may be accompanied by hues which are no proper shade of green or its component parts, as reds. A well-known instance is that of the variety of Kale called Ragged Jack, which is permanent when raised from cuttings. How far it may have the same effect upon the stock as other variegated grafts has, perhaps, not been ascertained. Any such effect if really produced would probably be confined to the white or whitish cells, for coloured cells apparently exercise no general effect upon those with which they are connected. The stock and graft retain their own peculiarities of colour unchanged. In the white Silesian and red Beet grafted on each other by Dr. Maclean (see *Gardeners' Chronicle*, 1855, p. 20) there was not the least blending of the colours in the contiguous cells.† "Each produced its own colouring matter in its own new cells as they formed superficially, the red cells adhering to the white cells while in the nascent state, but retaining each the peculiarity belonging to it, without any interchange of contents through the sides of the walls in contact."

297. It is not then with any primary or normal disposition of red tints combined with blue or otherwise that we are concerned in this place. They do not depend upon any diseased action as far as we know, nor can they communicate like tints arising from true variegation to tissues with which they may be in contact. The decoloration of which we now wish to speak is that which accompanies tissues when arrived at full maturity and just about to lose their vitality, evidenced either by parting from the parent plant, or by a tendency to enter into further and more rapid decomposition. It may be regarded possibly rather as a symptom than as an especial disease; but in whatever light it may be regarded, it is the inevitable forerunner in mature tissues of more or less speedy decay.‡ The presence of chlorophyll is necessary in almost all self-sustained plants;* but the green tint is rather a concomitant of healthy effects produced by exposure to light and air than anything to which we can attribute inherent virtue. In Chlorosis we see that the defect of colour is accompanied by an unhealthy condition, rapidly tending to death, and when organs have arrived at maturity, and have performed their functions, changes take place in the chlorophyll concomitant, as before, with derangements dependent upon old age. And this is the more probable because it appears from the observations of M. Macaire Princep, that the red and yellow colour of flowers is the same as that which exists in leaves which have assumed what are commonly called autumnal tints. Such tints take place only in leaves exposed to sunlight, under which they absorb oxygen instead of giving it out. The change of colour, then, is dependent on the formation of an acid which changes the chlorophyll first to yellow and then to red.† A red leaf macerated in potash becomes green, but a green leaf treated with an acid becomes yellow (see Thomson's "Organic Chemistry," p. 426). It is, therefore, apparently more a purely chemical than a vital phenomenon, and where the assumption of florid hues may be supposed to be essentially vital, as in the flowers of plants, such parts are seldom of very long duration, but for the most part pass rapidly into decomposition, except the moisture which they contain is very small originally, or soon dried up.

298. The green tint of chlorophyll not only passes into other colours, but sometimes becomes unnaturally deep, a circumstance which is occasionally indicative of evil. Under the full action of light and air, forcing manures or certain gaseous matters have this effect; and the same phenomenon takes place in fairy rings under the influence of the fungi by which they are produced. The presence of mycelium in tissues, as for instance that of bunt, causes sometimes a marked intensity of green, by which the plants which are affected may be pointed out long before the spike appears, and indeed in the case of seed purposely inoculated, occasionally from the earliest infancy. Some other epiphytal fungi have a similar effect. The general deep tint observed in some years at the beginning of autumn in woods is caused by the dark Fumagos which overrun the leaves.

ROBINIA PSEUD-ACACIA.

This elegant and fast-growing tree has been justly celebrated for the strength and durability of its timber. But some writers, in their enthusiastic encomiums on it, have attributed to it qualities to which it can lay no claim, more especially when grown in this country. Its chief merit consists in the early formation of heart wood, its strength and durability; the other portions of the tree possess no claim to notice more than any other quick growing tree. Having been employed for very many years by a gentleman who has planted a goodly number of the Robinia, and who has in various ways tested and proved the lasting qualities of its wood, I am, therefore, enabled to give the following remarks from practical experience and observation.

The Robinia delights in a rich light soil and sheltered situation. In such a soil it is questionable whether digging or trenching is of advantage. Its natural habit when young is to grow freely and rapidly, making shoots, when once established, from 6 to 10 feet in a season. The object in such a soil should be rather to check than encourage an excessive growth; for the great defect of the Robinia in its young state is the splitting and separation of its branches from the trunk, even by their own weight, and much more than when exposed to a brisk wind. In light sandy, gravelly, or chalky soils I would advise the ground to be trenched 18 inches deep. In stiff retentive clays I have seen repeated trials to grow it without success; the last trial was made in 1845, but in the wet autumn of 1852 and spring of 1853 they all perished. A strong stiff soil, on which is laid a large quantity of sand, and then trenched, however, appears to suit it well. The splitting and separation of the branches require the constant attention of those who plant the Robinia to produce lasting timber. I confess I am unable to point out any mode of treatment by which this natural defect may be entirely overcome; but shortening or pruning back the young wood during summer and even the leading shoot when it shows a tendency to split off, appears to me to be the best way of lessening the evil. From the neglect of such a mode of proceeding I have frequently seen trees of considerable size much injured; and, therefore, if we would have the wood of the Robinia in perfection, we must grow it under a regular and systematic course of pruning. It may be grown to produce timber in dells, or where it is surrounded by high trees, but not to the exclusion of sunlight and air, for these, I hold to be indispensable to the organism of the tree. In woods where there are large vacant spaces, if the soil is suitable (and any soil that is not retentive of excess of moisture will do), the Robinia may be planted with advantage. When planted in the margins of plantations, or in belts by the side of public roads, &c., its leaves contrast agreeably with the more formal and darker foliage of many of its associates; its clustering, drooping, white, Pear-blossoms are very attractive, furnishing an agreeable perfume, and during the brief periods of their beauty they afford an abundant and rich harvest to the honey-bee. In favourable seasons this tree ripens abundance of seed, and if it is kept in the pod until the following spring, and sown in light good soil, it will grow freely.

When of considerable size, the Robinias may be transplanted with safety; indeed, for ornamental purposes moved trees are to be preferred, it makes them less vigorous, and consequently they are better able to resist the force of winds. When removed the branches should be well cut back, and the long rope-like roots which run near the surface carefully preserved to a considerable length, with a view to ensure its growth as well as to assist in keeping it in an erect position.

What Robinias have come under my notice have not attained a great age or size; but the heart-wood has attained full maturity in from 25 to 35 years; when put down, trees of the latter age have even shown signs of decay at the pith; after that age the growth is slow, but they will resist the force of the storm unscathed. When once established repeated thinnings will soon be replaced by suckers, which are produced freely from the roots. The rapid growth and the early period at which it produces heart-wood, has induced the belief that the young stems were well adapted for Hop-poles; but those who are practically acquainted with its mode of growth will require no argument to convince them that it is ill adapted for this purpose. If Hop-poles can be obtained at all from it they must be from those trees that have grown up with long and straight branches or limbs, and that have made durable heart-wood. These, indeed, will be lasting. Cattle will eat eagerly of the young shoots and foliage of the Robinia, but fortunately the green meadows and pastures, together with the greatly improved husbandry of our country, will, we hope, always preclude the necessity of depending on such a source for a supply of fodder for our stock.

The Robinia has likewise been praised for its abundant and quick supply of firewood; but when we take into consideration the strong and repulsive thorns with which it is armed in the early period of its growth, and that the workman must be thoroughly defended by a panoply of leather before he can attempt to make any progress with the work, it is not likely that it will ever become a favourite in this country as an inhabitant of the copse; but if its qualities in this respect were even such as have been described, there could be little inducement now to plant it for this purpose. The formation of railways has opened up an intercommunication throughout the country, by which the produce of our coal-fields, the wreck of the forests and morasses of bygone ages of our globe, are conveyed for our use.

Upon a careful examination of those trees that have come more particularly under my notice, I find that there is not more than one in ten whose stems are without blemish and decay; these defects are principally caused by winds breaking off the branches, producing decay and admitting moisture; or possibly the nature of the soil and the variableness of our climate may tend to accelerate the evil. These are the reasons, notwithstanding the undoubted value and durability of its wood, and the urgent recommendations of many of its advocates, why it is not more generally planted in this country.

I shall not enumerate the purposes to which its wood has been applied in this and other countries, but will merely confine my remarks to what I have seen it taken for, which has been for strong posts to support the roofs of open sheds, gate posts, posts for various sorts of fencing, frames for covered tanks, window sills, handles for picks and mattocks, espalier stakes, Dahlia stakes, Carnation sticks, flower sticks, tallies, &c. &c.; and likewise for cabinet work. The heart-wood should be well seasoned before it is sawn up for Dahlias and for flowers, otherwise it is apt to twist and warp.

The measurements of the following specimens are given with a view to show the growth of the tree and size of timber in a given number of years, but no account is taken of the limbs, many of which would make posts for low fences; the trees are selected from many planted at the same time, the stems are apparently sound, having no outward appearance of decay.—1st. Planted in 1844, nine years' growth; height of tree, 28 ft.; circumference at ground, 1 ft. 8 in.; at 6 ft. high, 1 ft. 4 in.; protected by large trees. 2d. Planted in 1822, 31 years' growth; ground trenched 2 ft. deep; height, 45 ft.; stem at ground, 4 ft. 9 in.; at 10 ft., 3 ft. 8 in.; at 15 ft., 3 ft. 6 in.; no protection. 3d. Planted in 1821, 32 years' growth; deep, rich, garden soil; height, 50 ft.; stem at ground, 5 ft. 1 in.; at 10 ft., 3 ft. 3 in.; at 20 ft., 2 ft. 8 in.; at 30 ft., 2 ft.; rather sheltered. 4th. Planted in 1811, 34 years' growth, ground trenched 2 ft. deep, light soil, chalky bottom; height, 45 ft.; stem at ground, 4 ft. 9 in.; at 10 ft., 3 ft. 7 in.: at 18 ft., 2 ft. 5 in.; no protection. 5th. Planted in 1819; 34 years' growth, ground trenched 2 ft. deep; light soil, gravelly bottom; stem at ground, 4 ft. 3 in.; at 10 ft., 3 ft. 2 in.; at 20 ft., 2 ft. 11 in.; at 30 ft., 2 ft. 8 in.; height of tree, 55 ft.; clear stem, free from branches, protected south and west by high trees.

I have omitted to mention that the above trees were planted along with Larch, Turkey Oak, and Fir trees.

* The "Handbook of Villa Gardening," by Wm. Paul. Piper and Co. 12mo, pp. 138.

"The Town Garden," by Shirley Hibberd. Groombridge. 24mo, pp. 172.

† This is the more remarkable because deep red Beet when eaten in large quantities imparts colour to the urine. The colouring matter is probably not chemically combined with the fluid, or at least not in a state of real solution but merely suspended in it, and therefore will not pass through the membranous walls.

‡ All assumption of florid tints by parts normally green is not, however, necessarily indicative of decay. The bleached shoots of Pelargoniums for instance, which have been produced in a cellar, assume a red tint when exposed in a warm frame to light. The tint may, however, be confined to the petioles of the leaves, the laminæ acquiring rapidly a full green without any concomitant red. A branch of Alder if cut across soon assumes a vivid red. In this case possibly the change may be one rather of molecular arrangement in the exposed sap than of chemical composition, as in the analogous blue tint of many Boleti.

* Monotropa is stated by Duchartre, in his memoir on that genus, to be no true parasite. It is certainly capable of cultivation, which is not the case with Orobanches, and such plants as derive their nutriment from some organised matrix.

† It is obvious that change from green to yellow is not necessarily dependent upon the same causes as the prevention of the formation of a full green tint. The one may take place in the presence of light, the other in its partial or total absence.

but they have outgrown them all except the Larches, which have maintained their ascendancy.

A variety from the nursery planted in 1816, and replanted on a lawn in 1818, has attained a height of 60 ft., fully exposed, with a girth or circumference at bottom of 7 ft. 10 in.; at 10 ft, 4 ft. 4 in.; at 20 ft., 4 ft.; at 28 ft., 3 ft. 9 in.; at 5 feet high are several large limbs, of which no notice is taken.

In the rector's garden, a tree which had apparently been cut down, and had afterwards thrown up two stems, is now (both stems) 55 ft. in height. No. 1. Circumference at bottom, 5 ft. 8 in.; at 10 ft., 4 ft. 4 in.; at 20 ft., 3ft. 4 in.; at 33 ft., 2 ft. 10 in. No. 2. Circumference at bottom, 5 ft. 8 in.; at 10 ft., 4 ft. 10 in.; at 20 ft., 3 ft. 8 in.; at 33 feet, 3 ft. Several large limbs have been sawn off. There is no record when it was planted, but it is certainly more than 50 years of age. *Tassel.*

SALVIA SPLENDENS.

Cuttings of this gay winter flowering plant may be put in now, and afforded a gentle bottom-heat until they emit roots, when they should be potted singly in small pots. After potting place them in a close but not over warm situation, and as soon as they get established keep them near the glass, and afford them all the light possible, syringing overhead morning and evening in bright weather, and keeping the atmosphere as moist as circumstances will admit. If good sized specimens are wished by the autumn the young plants must not be allowed to suffer for want of pot room. As they advance in growth the shoots should be carefully stopped and tied out, in order to secure bushy compact specimens; but if a vigorous root action is maintained, there will be little difficulty in keeping the plants bushy. A cold frame or pit will be the best situation for them after the beginning of May, or earlier if the weather proves favourable; but they should be kept close here, and not allowed to sustain any check, which at this stage would be very injurious. If all goes on well, the plants will be ready for shifting into good-sized pots by the end of June, and I seldom repot them after that season. By that time they should be strong and well established in 8-inch pots, and when this is the case I shift some into 12 and others into 15-inch pots, according to the strength of the plants and the size it may be desirable to have them by the flowering season. They should be returned to their former situation, kept close and moist, and encouraged to make active growth, merely giving sufficient air to keep the young wood strong. When the pots get well filled with roots, and the plants become good-sized specimens, which will be the case by August, they should be gradually prepared for removal to a sheltered situation out of doors, where they will be shaded from the forenoon sun. Here they will make short growth, and will flower more profusely than if kept under glass all the autumn. Stopping should not be practised on plants intended to flower in November later than about the middle of August. As soon as the weather becomes unsettled in autumn the plants must be placed under glass, for they are very easily injured by frost, and should be afforded a light airy situation. After flowering, the specimens may be thrown to the rubbish heap, reserving one or two to supply cuttings. These should be kept dry at the roots for a fortnight, then cut back rather closely, and placed in any spare corner of the greenhouse until towards the end of February, when they should be placed in a warm house, and thoroughly watered, when they will soon furnish a supply of cuttings. *Alpha.*

CLIMATES OF FOREIGN COUNTRIES.—No. VII.

Climate of Madras.—From the meteorological observations made in the years 1846-1850 at the Hon. East India Company's Magnetical Observatory at Madras, and printed by order of the Madras government, we learn that, on the mean of five years, the barometrical pressure is greatest in January and least in June, with a gradual decrease and increase between these extremes, but that the law is not strictly followed out in individual years; as for example in 1850, February had the greatest mean pressure; and in 1849, May had the least. The greatest and least pressures observed during the five years both occurred in 1846, and were respectively 30.189 inches on January the 11th, and 29.346 inches on October the 20th. The four daily tides of pressure are well marked, even by a single day's observation, the exceptions being very rare, and occurring only in tempestuous weather. The principal maximum occurs on a mean at $9^h. 15^m.$ a.m., the excess above the mean being .060; the principal minimum at $3^h. 52^m.$ p.m., being .060 below the mean. There are two minor tides in the night, the maximum of + .032 occurring at $10^h. 5^m.$ p.m., and the minimum of — .026 at $3^h. 22^m.$ a.m. The greatest average daily range (.130) occurs in March, and the least (.106) in December. As it has been stated that, at St. Helena and other places, the moon produces a sensible effect on the barometer, the observations of 1846 were reduced and arranged according to the moon's right angle, with the view of ascertaining if anything of the kind was perceptible at Madras; but the result would lead us to infer that the moon has no direct influence, either on the atmosphere or on the mercurial column.

With respect to temperature, it appears that for the five years 1846-50, the hottest month was May, though June nearly equals it, and was in excess in three years out of the five. January is the coldest month, but December has the least daily variation. The line of the mean daily temperature throughout the year forms a very regular parabola; while that of the night differs little from a straight line. It is therefore difficult to estimate exactly the time of minimum temperature, but it appears usually to precede sunrise by a few minutes. The mean maximum temperature for the year is 89°, the mean minimum 77°. The highest temperature noticed during the five years was May 18, 1849, when the thermometer indicated 108°. The lowest was 63° on the morning of the 27th of January, 1850.

The driest month is June, and the most humid are October and November: the daily curve of humidity is very nearly an inversion of that of temperature; the driest being about 1 p.m., and the moistest about sunrise, except in June and July, when the moisture is greatest about midnight.

The average annual fall of rain for the five years was 58.583 in. The most rainy month is October, which averages 14.868 in.; November nearly equals it, the average for that month being 13.916. March is the only month in which no rain falls.

The course of the winds throughout the year is as follows:—In January, until about the middle of February, N.E; then southerly winds predominate, especially S.E., until the middle of May, when the S.W. monsoon commences, and continues the prevailing wind until the end of September. In October the winds are variable and nearly equally divided between the four quarters, until about the end of the month, when the N.E. monsoon sets in, and prevails until February. Taking the whole year the southerly winds considerably predominate. On the average the number of days from each quarter is, N.W., 63—N.E., 85—S.E., 96—S.W., 121. These results are not only interesting in so far as meteorology is concerned, but they are of considerable importance in a horticultural point of view to those engaged in the cultivation of tropical plants, particularly of such as are peculiar to the neighbourhood of Madras. They show that, in order to compensate for the great degree of heat to which vegetation is subjected there in the daytime, Nature supplies a proportionate amount of moisture in the form of heavy dews or rain at night, the average depth of rain being nearly three times the quantity which usually falls in the climate of London, thus making the daily curve of humidity, as stated in the report, an inversion of that of temperature. The young and inexperienced cultivator will therefore do well to remember this, and if he hopes to be successful he must endeavour as much as possible to imitate such a climate by using the syringe most liberally during the summer season, as late in the evening, after a fine warm day, as it can be done without inconvenience. *W. B. B.*

New Plants.

122. Thujopsis dolabrata, *Siebold and Zuccarini Flora Japonica, Vol. II., p.* 32; *aliàs* Thuja dolabrata, *Thunberg.*

A living plant or two of this fine tree having reached the Botanic Garden, Leyden, as we learn from Monsieur de Vriese, the learned Professor of Botany in that institution, our readers may be glad to know something of its history.

We are told that as a genus Thujopsis differs from Thuja in the scales of its cones being woody, with five seeds in two rows in the axil of each. It has the same flattened branches and leaves; but the latter are

covered with glaucous stomates, all over the middle, which looks towards the ground, while the Thujas have no stomates at all.

The tree is a native of Japan, where it is called *Hiba*, and acquires great stature with a majestic aspect. The head is pyramidal, and formed of spreading or even pendulous branches. It grows wild on mountains in the islands of Nipon, especially on the chain called Hakone, where it prefers the damp slopes of the valleys. Its wood is much valued for building purposes. The leaves are very dark green, except at the middle of the back, where they are covered with a silver bloom like that of a Plum, which gives them a singularly beautiful appearance. There is a sort of smaller stature called Nezu by the Japanese.

We presume the plant to be as hardy as the common Thujas, which no frost seems to touch. A, in our figure, represents a twig the natural size; B, a portion magnified, copied from the "Flora Japonica."

Home Correspondence.

Preserves and Copper Vessels.—May I ask your opinion on a point which is certainly of much importance to the comfort and health of a large part of the community:—Is it safe to prepare acid preserves by boiling in bare untinned copper pans, as is, I believe, the established practice, both in private families and in the confectionary trade? A shopkeeper lately informed me that he is in the habit of supplying most of the houses in his neighbourhood with copper preserving pans, and that mine is the only house that requires them to be tinned. The misfortune is, that even tinning cannot be relied on as a remedy for the danger, as that operation is usually performed by applying, for the sake of cheapness, about equal parts of tin and lead; so that it would appear that the eaters of preserves have only the choice of being poisoned by copper or by lead. I have somewhere read that there is no danger of the copper being dissolved as long as the acid is kept boiling and not allowed to cool in the vessel, but this statement is so contrary to all experience in chemical combinations that it is difficult to think it can be correct. *Death in the Pot.* [There is no doubt that preserves prepared in naked copper vessels are unwholesome; or that the mischief is increased if a mixture of tin and lead is substituted for tin itself, which we dare say occurs in these days of rascality. The last suggestion is as new to us as to you. Preserving pans should always be made of bell-metal.]

Mowing Machines.—Can any one inform me which is the very best mowing machine now in use? For some years I have used Budding's, which answered my purpose exceedingly well; but as I am now in want of a new one I imagine there may be some superior to the one I have just named. I have seen Samuelson's, but it will not suit, in consequence of the wheels not going sufficiently near the edge of the walks; I want one that will cut close to the edge of the flower beds and walks; one, therefore, that has wheels projecting like Samuelson's will not answer. I want one sufficiently large for a strong lad to pull, and as I only employ manual labour, I would like one to run as lightly as possible. Any information on the subject will oblige *E. B., Perdiswell.*

Comparison between the late Winter and that of 1854.—I send you the following tables of averages, which may be interesting. I have no maximum average of the thermometer for January, 1854; the tables are therefore made without it:—

		1854	1855	Differ.
Average maximum of thermometer	January ..	caret	34·6	—
	February ..	45.56	30.60	14 96
	March ..	54.00	41.03	12.97
Average minimum of thermometer	January ...	32.03	25.2	6.83
	February ...	32.85	19.40	13.45
	March ...	31.12	26.98	4.14
Mean temperature ...	January ..	caret	caret	—
	February ...	39.20	25.00	14.20
	March ...	42.56	34.00	8.56
Average maximum of February and March		49.78	33.11	16,67
Average minimum of January, February, and March		32.00	23.96	8.04
Mean temperature of February and March		40.87	28.15	12.72

We cannot wonder at the lateness of the spring, when, though the winter of 1854 was considered severe, the mean temperature of February and March, 1855, is 12.72 lower than that of the same months in 1854. *A. R., Bromley Common, Kent, April* 11.

The Nimrod Strawberry.—I had hoped that ere this some explanation would have been given by Messrs. Lucombe, Pince, and Co. respecting the Strawberry sent out by them in the autumn of 1853, under the name of "Nimrod;" such not having been the case, I wish to say a few words upon the subject. The simple facts are these:—In the *Gardeners' Chronicle* it was stated that fruit of a seedling Strawberry under this name had been sent to the Editor, and that it was superior in sweetness and richness of flavour to the British Queen; soon afterwards an advertisement appeared from Messrs. Lucombe, Pince, and Co., stating that they had purchased the stock of this Strawberry of the raiser, and that it would be sent out in October. I was induced to become a purchaser of some plants, and was much disappointed to find that they were merely Myatt's Eleanor. I have heard it hinted that there was some mistake; if so, Messrs. Lucombe, Pince and Co. should have frankly stated that this was the case, and every purchaser would have been satisfied; now, the very reverse is the fact, and it is a matter of serious consequence to the trade, as persons will be very shy of purchasing articles advertised as novelties after having been so completely deceived. *Henry Doubleday, Epping, April* 9. [This statement is not exactly correct. What the *Gardeners' Chronicle* stated was as follows: "We have received samples of the Nimrod Strawberry from Mr. Sanders, the intelligent gardener at Tedworth, with a request that we would state our opinion of it. *So far as we can judge of it, after having been packed in a post-office bag.*

for several hours, we should say it is superior to the British Queen; it is large, oblong, or rather conical, with the same colour as that variety, but sweeter and richer. *It is said* by Mr. Sanders to be an excellent bearer, and to force well; in addition to which *it is reported* to be much hardier than the British Queen, nearly all which perished last winter round Tedworth, while this Nimrod suffered in no degree whatever."]

Effects of the Winter about Newark.—In this immediate district the frost of the winter has done more mischief than was done by the frost of last year. The common Laurels are killed by hundreds, at least cut quite down to the ground. Last year they suffered very little. The Cupressus macrocarpa, I fear, is killed. The Pinus insignis, which was untouched last year, has its spines turned brown half way through. The variegated Golden Holly has the white or golden leaves generally turned brown. The large Araucarias have their leaves tinged with brown many feet higher from the ground than last year. The Cryptomeria has not suffered much. Pinus Russelliana is killed. In several places the common Yew is burnt on one side, and the Cedar of Lebanon also. Altogether these two last winters have cut very short the catalogue of hardy shrubs. *D.*

Early Rhubarb (see p. 208)—Your correspondent who says his gardener last October covered over some Rhubarb with cement casks and fold-yard manure, which was added several times in order to force the growth, and again some four months afterwards covered over, in a precisely similar way, other roots on the same soil, which though last covered were ready first, should remember that he covered up at a time when Rhubarb was wholly at rest, and when it would require double the time and heat to start it that it would when he covered his second lot, growth at that time having already commenced. Besides, starting to force before midwinter does not ensure his cutting so much earlier, more especially if the Rhubarb had not been forced before; if, however, it has once been started early it will start about the same time ever after, with little trouble; but to begin too soon, as your correspondent states, would require something more than merely adding manure "several times," for every gardener knows too well the uncertainty of dung heat in hard weather. If, on the other hand, your correspondent should begin to force after midwinter, and continue the heat till he gets a supply of Rhubarb, and the next year commence a week or two earlier, he might not then fail. It must be remembered, however, that different sorts of Rhubarb naturally vary very much as regards earliness. *J. Divers, Maidstone.*

Does Sea-water Kill Seeds?—I have begun making some few experiments on the effects of immersion in sea-water on the germinating powers of seeds, in the hope of being able to throw a very little light on the distribution of plants, more especially in regard to the same species being found in many cases in far outlying islands and on the mainland. Will any of your readers be so kind as to inform me whether such experiments have already been tried? And, secondly, what class of seeds, or particular species, they have any reason to suppose would be eminently liable to be killed by sea-water? The results at which I have already arrived are too few and unimportant to be worth mentioning. *Charles Darwin, Down, Farnborough, Kent, April* 11.

Foreign Correspondence.

Leaves from my Chinese Note-Book: No. 8.—*A Journey in search of a new Cedar or Larch, called Abies Kæmpferi.*—I have been acquainted with this interesting tree for several years in China, but only in gardens, and as a pot plant in a dwarfed state. The Chinese, by their favourite system of dwarfing, contrive to make it, when only a foot and a half or two feet high, have all the characters of an aged Cedar of Lebanon. It is called by them the *Kin-le-sung*, or Golden Pine, probably from the rich yellow appearance which the ripened leaves and cones assume in the autumn. Although I have often made inquiries after it, and endeavoured to get the natives to bring me some cones, or to take me to a place where such cones could be procured, I met with no success until last autumn. Then, however, I happened to visit a part of the country where I had not been before, and quite unexpectedly came upon some fine specimens of full grown trees covered with ripe cones. They were growing in the vicinity of a Buddhist monastery in the western part of the province of Chekiang, at an elevation of 1000 or 1500 feet above the level of the sea. Their stems, which measured fully 5 feet in circumference 2 feet from the ground, carried this size, with a slight diminution, to a height of 50 feet, that being the height of the lower branches. The total height I estimated about 120 or 130 feet. The stems were perfectly straight throughout, the branches symmetrical, slightly inclined to the horizontal form, and having the appearance of something between the Cedar and Larch. The long branchless stems were, no doubt, the result of their growing close together and thickly surrounded with other trees, for I have since seen a single specimen growing by itself on a mountain side at a much higher elevation, whose lower branches almost touched the ground.

I need scarcely say how pleased I was with the discovery I had made, or with what delight, with the permission and assistance of the good priests, I procured a large supply of those curious cones sent to England last winter. It was with great regret I read in this paper, and in a letter from Mr. Glendinning, that so few of these seeds had vegetated, and in order to increase the number by procuring another supply, I paid a visit this autumn to the place where I had been so successful last year, with what results I shall proceed to relate. Having arrived at the Monastery of Tsan-tsing—for that is the name of the place—I lost no time in visiting the spot of my last year's discovery. The trees were there as beautiful and symmetrical as ever, but after straining my eyes for half an hour I could not detect a single cone. I returned to the temple and mentioned my disappointment to the priests, and asked them whether it was possible to procure cones from any other part of the country. They told me of various places where there were trees, but whether these had seed upon them or not they could not say. They further consoled me with a piece of information, which, although I was most unwilling to believe it, I knew to be most likely too true, namely, that this tree rarely bore cones two years successively, that last year was its bearing year, that this one it was barren. A respectable looking man, who was on a visit to the temple, now came up to me and said that he knew a place where a large number of trees were growing, and that if I would visit the temple to which he belonged he would take me to this spot, and that there I would probably find what I wanted. I immediately took down the name of his residence, which he told me was Quan-ting, a place about 20 le distant from the temple in which I was domiciled, and at a much higher elevation on the mountains. Having made an appointment for next day he took his leave of me with great politeness, and returned to his home.

Having procured a guide for Quan-ting, I set out early next day to visit my new acquaintance. Leaving the temple of Tsan-tsing, our way led up a steep pass, paved with granite stones. On each side of the road were forests of fine Bamboos—the variety called by the Chinese *Moou*, the finest I ever saw. The forests are very valuable, not only on account of the demand for the full-grown Bamboos, but also for the young shoots, which are dug up and sold in the markets in the early part of the season. Here, too, were dense woods of Cryptomeria, Cunninghamia lanceolata, Oaks, Chesnuts, and such like representatives of a cold or temperate climate. The Chinese Chesnut appears to differ slightly from the Spanish, but it is superior to that variety. A very pretty small one, about the size and form of the Hazel Nut, is much esteemed; both, I think, worth introduction to Europe. I have sent them both to India, and I am happy to hear that both are now doing well on the Himalayan mountains. Chesnuts have long been a desideratum in India; many fruitless attempts have been made to introduce them, but with Ward's cases we now work wonders.

Our road was long and rugged, and we were gradually attaining a higher elevation. We reached the temple of Quan-ting at last, and had no difficulty in finding our acquaintance of the preceding day, Mr. Wang-a-nok, as he called himself. It now appeared he was a celebrated cook—the Soyer of the district—and had been engaged on this day to prepare a large dinner for a number of visitors who had come to worship at the temple. He told me he would be ready to accompany me as soon as the dinner was over, and invited me to be seated in the priest's room until that time. This little temple has no pretensions as regards size, and was in a most dilapidated condition. In one of the principal halls I observed a table spread and covered with many good things, which were an offering to Buddha, and before which the visitors, as they arrived, prostrated themselves. As the valley in which the temple is placed is fully 3000 feet above the sea, I felt the air most piercingly cold, although it was only the middle of October, and hot enough in the plains in the day time. So cold was it that at last I was obliged to take refuge in the kitchen, where Mr. Wang was busy with his preparations for the dinner, and where several fires were burning. This place had no chimney, so the smoke had to find its way out through the doors, windows, or broken roof, or, in fact, any way it could. My position here was, therefore, far from being an enviable one, although I got a little warmth from the fires. I was therefore glad when dinner was announced, as there was then some prospect of being able to get the services of Mr. Wang. The priests and some of the visitors now came and invited me to dine with them, and, although I was unwilling, they almost dragged me to the table. In the dining room, which was the same, by-the-by, in which they were worshipping on my arrival, I found four tables placed, at one of which I was to sit down, and was evidently considered the lion of the party. They pressed me to eat and to drink, and although I could not comply with their wishes to the fullest extent, I did the best I could to merit such kindness and politeness. But I shall not attempt a description of a Chinese dinner which, like the dinner itself, would be necessarily a long one, and will only say that, like all good things, it came to an end at last, and Mr. Wang having finished his in the kitchen and taken a supply in his pockets, declared himself ready for my service.

Our road led us up to the head of the valley in which the temple stands, and then it seemed as if all further passage was stopped by high mountain barriers. As we got nearer, however, I observed a path winding up round the mountain, and by this road we reached the top of a range of mountains fully a thousand feet higher than any we had passed, or 4000 feet above the sea. When we reached the top the view that met our eyes on all sides rewarded us richly for all the toil of the morning. I had seen nothing so grand as this since my journey across the Bohea mountains. On all sides, in whichever direction I looked, nothing was seen but mountains of various heights and forms, reminding one of the waves of a stormy sea. Far below us in various directions appeared richly cultivated and well wooded valleys; but they seemed so far off, and in some places the hills were so precipitous, that it made me giddy to look down. On the top where we were there was nothing but stunted brushwood, but, here and there, where the slopes were gentle, I observed a thatched hut and some spots of cultivation. At this height I met with some Lycopods, Gentians, and other plants not observed at a lower elevation. I also found a Hydrangea in a leafless state, which may turn out a new species, and which I hope to introduce to Europe. If it proves to be an ornamental species it will probably prove quite hardy in England.

We had left the highest point of the mountain ridge and were gradually descending, when on rounding a point I observed at a distance a sloping hill covered with the beautiful object of our search—the Abies Kæmpferi. Many of the trees were young, and all had apparently been planted by man; at least so far as I could observe they had nothing of a natural forest character about them. One tree in particular seemed the queen of the forest, from its great size and beauty, and to that we bent our steps. It was standing all alone, measured 8 feet in circumference, was fully 130 feet high, and its lower branches were nearly touching the ground. The lower branches had assumed a flat and horizontal form and came out almost at right angles with the stem, but the upper part of the tree was of a conical shape, resembling more a Larch than a Cedar of Lebanon. But there were no cones even on this or on any of the others, although the natives informed us they had been loaded with them on the previous year. I had therefore to content myself with digging up a few self-sown young plants which grew near it, and which I shall endeavour to introduce to England.

I now parted from my friend Mr. Wang, who returned to his mountain home at Quan-ting, while I and my guide pursued our journey towards the temple in which I was staying by a different route from that by which we had come. The road led us through the same kind of scenery which I have endeavoured to describe — mountains; nothing but mountains, deep valleys, and granite and clay-slate rocks—now bleak and barren, and now richly covered with forests chiefly consisting of Oaks and Pines. We arrived at the monastery just as it was getting dark. My friends, the priests, were waiting at the entrance, and anxiously inquired what success had attended us during the day. I told them the trees at Quan-ting were just like their own—destitute of cones. "Ah!" said they, for my consolation, "next year there will be plenty."

I cannot agree with Dr. Lindley in calling this an *Abies*, unless Cedars and Larches are also referred to the same genus. It is apparently a plant exactly intermediate between the Cedar and Larch; that is, it has deciduous scales like the Cedar and deciduous leaves like the Larch, and a habit somewhat of the one and somewhat of the other. However, it is a noble tree; it produces excellent timber, will be very ornamental in park scenery, and I have no doubt will prove perfectly hardy in England. *R. F.*

Societies.

Entomological: *April* 2.—J. Curtis, Esq., President, in the chair. Donations of books from the Royal Society, the Society of Arts, the Entomological Society of Stettin, Berwickshire Naturalists' Club, &c., were announced, as well as an extensive collection of specimens of aphides preserved in Canada Balsam presented by Mr. F. Walker, and a number of rare British Lepidoptera by Mr. H. Doubleday. Mr. Stainton stated with reference to the discussion respecting the corrosion of the pins with which insects are stuck, that he had only observed this to occur in one species of Nepticula (N. Acetosæ), and from the acid nature of the Sorrel upon which it fed it might be considered that the corrosion was attributable to the nature of the food of the larva; the transformations of the species in question had been observed last year by Mr. Shield, of Dublin. Mr. Foxcroft exhibited specimens of 17 rare species of Lepidoptera which he had reared from larvæ taken last year in Fifeshire; he also exhibited specimens of Papilio Machaon reared from two very different varieties of larvæ. Mr. Bond exhibited a variety of Spilosoma Menthastri. Mr. Edward Shepherd exhibited specimens of Donaciæ, some stuck with the common pins and others with electro-plated pins; the former were now, after a few months, infected with verdigris, whilst the latter remained uninjured. Mr. Samuel Stevens exhibited specimens of the very rare Euchirus longimanus, male and female, brought to England by Madame Pfeiffer, from the Eastern Archipelago; also specimens of Euchirus MacLeayii. A note was read from Mr. Wallace containing a description of a magnificent new species of butterfly belonging to the genus Ornithoptera from Borneo, which he proposed to name after the Rajah Brooke. Mr. Curtis read a note on the species of Galls, recently figured by himself in the *Gardeners' Chronicle*, suggesting that some of them might prove varieties. A memoir by Mr. Dunborough was read on the natural history of the hive bee, being a continuation of his observations on the observatory hive, which had gained the prize recently given by the Society on that subject. The secretary read a notice that the Council had resolved to offer the duplicate insects in their collection for distribution among the

members. The portion at present arranged for that purpose consists of foreign butterflies, foreign Coleoptera, and British Coleoptera, the distribution to commence after the June meeting, the Council hoping that members partaking in the distribution will in return contribute to the Society's collection from their own stores. Dr. Gray stated that he had made arrangements with Mr. Janson for the preparation and publication of a working catalogue of British Coleoptera; and also that he had secured for the British Museum collection the whole of the types of Mr. Wollaston's Coleoptera of Madeira.

British Meteorological, *March* 27.—Dr. R. D. Thomson in the chair. A paper was read "On the late severe weather, as compared with that of 1814; and on the crystals of snow, observed during its continuance;" by James Glaisher, Esq., F.R.S.

The present year was ushered in with a high temperature, exceeding its average by quantities varying from 8° to 12° daily. On Jan. 10 a cold period set in, together with a dense fog, and the temperature which was as high as 49.6 on the 9th, fell to 26° on the 11th; this diminution of temperature was accompanied by a change in the wind, which from blowing a compound from the west changed to a compound from the east, and with few exceptions has so continued up to the present time. On Jan. 12 and 13 the temperature was about its average value, but after the 14th, when the cold set in, its departures were very considerable, particularly over the south, west, and eastern parts of England. Scotland, and the northern counties were frequently exempt from any share in the great severity of the period, which was also less severely felt at sea-side than at inland places. The lowest temperature, viz., 0.8, took place at Berkhampstead, and at different places in England on several days it was recorded as low as 3°, 5°, 7° and 10°. For a similar period to the one which has just passed, it is necessary to go back to the year 1814. That year, however, commenced with a very low temperature, a frost having set in on December 26, 1813. The intensity of the two periods was about the same; it ended in 1814, on March 21st, whereas in the present year, with the exception of a short intermission about the first week in March, it has continued to the present time. The temperature of the present period has descended lower and more frequently than in 1814, in which year the coldest day was on Jan. 10, when the reading was 19.6. The lowest temperature of this year also occurred in January, and was 19.2. In 1814 the lowest temperature in February was on the 4th, and was 22°. The lowest reading in this month of the present year was 20.6, and took place on the 18th, and this Feb. was a much more severe month than the Feb. of 1814. The mean temperature of Feb. 1814, was 32.4, and that of the present year was 29.3. The snow this year has been replete with crystallised particles of compound figure, formerly imagined to be confined almost, if not entirely, to the Polar regions. The primary figure or base of each crystal was either a star of six radii or a plane hexagon. The compound varieties included combinations of spiculæ, prisms, and laminæ, clustered on and around the radii, and seemed in their various stages of formation, and almost endless variety, to defy any attempt to classify or arrange them into groups. At the commencement of the frost simple stellar forms were chiefly prevalent, and fell in clusters of from 10 to 20 in a group. They descended quickly to the ground, where they lay like cotton ravelings knotted here and there, an effect produced by the white molecule, the centre of each star. On the morning of Feb. 8 a large number of crystals fell intermingled with the snow, which continued from early morning till late at night, with a temperature of from 29° to 32°. From 8 to 9 A.M., crystals of arborescent character fell sparingly; after 9 these entirely ceased, and were replaced by minute and glistening hexagons of laminæ, which gradually gave place to other hexagons compounded of solid hexagons set round in groups, and solid. These again, as the day advanced, became exchanged for figures still more compound, and from the centre hexagon of which, diverged six radii laden with prisms, set on at an angle of 60°. Soon after November the crystals ceased falling for a time till 4 P.M., when the arborescent form again set in, and was soon after accompanied by a mingling of nearly all the figures which had previously fallen during the day. They only ceased with the snow long after dark, when it laid upon the ground to the depth of 8 ins. On Feb. 13th, 16th, and 17th, a large number of crystals were observed, particularly on the 17th. The prevailing form was an arrangement of six radii studded on either side with prisms, ranged parallel to each other, but of different lengths; some exhibited a double layer of prisms the one superimposed upon the other. A few were discovered of cruciform figure made up of solid hexagons cut into numerous facets; these last were very minute and scarcely discernible to the naked eye. On Feb. 21st, there fell a large number of very complex crystals made up of solids, both of rhomboidal and irregular figure, cut into many facets and heaped one upon the other; there were also a large number of double crystals, that is, two crystals united to each other by an axis at right angles to the plane of each. On Feb. 23 the frost gave way, but for some hours in the morning Mr. Glaisher was able to continue his observations. The morning was overcast and calm, and snow fell in flakes, accompanied by minute spiculæ; soon after 9 o'clock a change took place, and mingled with the heavy flakes there fell a large number of thick snowy crystals; on examining these with a Coddingstone, they were found to consist of an assemblage of prisms, grouped in thick arrangement, and bristling up (if the phrase may be allowed) at all angles from some invisible nucleus. Some of the prisms were longer than others, but most of them were notched here and there, giving indications of the intended formation of other prisms or spiculæ. After the lapse of half an hour the common flakes were fewer in number, and were accompanied with innumerable spiculæ. These did not fall separately, but in groups of several, clinging to each other at all angles. They had a fleecy appearance to the naked eye, but under the glass were long and rounded prisms, partaking much of the character of an icicle, but all notched and tapering to a point. At this time the air was soft and mild, and the snow was falling thickly. At 10h. 30m. the air was still calm, and the snow continued. At this time it was easy to detect here and there pinnules in an intermediate stage of formation. The spiculæ which were still falling were now of greater length, and their figure more perfectly developed. At 11 crystals were falling of great beauty and transparency, but of simple figure; they were aborescent and many of them double. Whilst observing them they changed their figure in the most curious and kaleidoscope manner possible, the upper groups of prisms collapsing first, the next in order next, and so on, the collapsing each time dissolving three or more prisms into one, a change effected with instantaneous rapidity. This was the first step preparatory to their dissolving: the next step was the rounding of every angle that remained, and the next step to that the extension and thickening of spiculæ, which had served as axes to prisms, and which now derived accession from their half finid and dissolving matter. In this manner they continued to exchange one simple form for another yet more simple until the pristine drop of water occupied the site of the former crystal. At 11h. 15m. snow was falling quickly in minute crystals, as described. The air was genial and mild, the clouds lightened as preparatory to sunshine, and the birds for a while sang joyously. All nature seemed to rejoice at the mitigation of the weather. At 12h. the snow had all but ceased, and the temperature was 37°. The cocks crew as anticipating a change; the birds answered each other from the trees. Icicles 2 feet in length, which had been noticed for 16 days previously, began fast to melt away. All nature but the birds was still, and what is rarely seen, the trees were dripping moisture, while the snow lay like a rime upon their branches and bended stems. At 1h. 13m. the temperature was 35.5, and small and fine snow was again falling, water was dripping everywhere, the birds were singing joyously, and the calm continued. The paper was illustrated by numerous drawings by Mr. Glaisher.

Notices of Books.

Commentaries on the Productive Forces of Russia. By M. L. de Tegoborski. Vol. I. 8vo, pp. 528. Longmans.

At last we have an account of the resources of the empire with which we are at war, a book which gives us some real information respecting our formidable antagonist. How far the facts and figures brought together by M. de Tegoborski can be relied upon we are not in a position to judge, but assuming them to be true, we proceed to select such as are most likely to be of general interest.

European Russia, including Poland and Finland, considerably exceeds half the entire surface of Europe, and had in 1851 a population of about 62 000,000 inhabitants, *i. e.*, three times the population of England and Scotland in the same year. The population of the Russian possessions in Asia, whence it has been supposed such swarms of troops can be procured, is estimated at less than 5,000,000, or scarcely more than twice the population of London. Of the surface of this immense empire it appears that 18 per cent. consists of land in cultivation, 12 per cent. of meadow, 35.8 per cent. of forest, and 34.2 per cent. of pastures, marshes, *Landes*, heaths, roads, canals, lakes, rivers, and grounds occupied by buildings. The forests are very unevenly distributed, for whilst in some districts they occupy nearly the whole ground, in others they are entirely absent; in the Government of Taurida, which includes the Crimea, only 4 per cent. of the country is forest. Of the land fit for cultivation, 234,000,000 of acres are eminently fertile, consisting of a black earth or humus, the like of which is not found in any part of Western Europe. The natural fertility of this soil is, however, in some districts more then counterbalanced by excessive droughts, which are so frequent and of such long duration that it is nothing uncommon for 20 months to pass without a single copious shower of rain. The mineral resources of Russia are comparatively unimportant. Iron of very fine quality, it is true, is exported; but in the agricultural districts this metal is so scarce as to be almost a luxury; in fact, owing to the concentration of the mines at the extremity of the country, iron is so dear that more than 9-10ths of the cart and waggon wheels of every description are without iron tire; and, with the exception of private carriages, all the axles are of wood.

The most important agricultural vegetable products are,—In the northern provinces Rye, Barley, Oats and Flax; in the central provinces and in Poland Wheat and all other cereals, vegetables, Hemp and Flax; in the southern provinces Wheat, wine, silk, oleaginous seeds, Tobacco, and several tinctorial and medicinal plants. The most important to England are corn, Flax, and Hemp.

The author calculates the mean annual crop of cereals throughout all the European possessions of Russia at 260 millions of tchetwerts,* equal in value to 144,000,000*l.* Podolia, and part of Poland, furnish the finest Wheat. Rye is the most extensively diffused throughout almost every district. Barley and Oats are also cultivated in abundance. The fluctuations in the price of corn are very great, and their causes are examined at considerable length; the most important seems to be difficulty of transit, owing to which a deficiency in one district is not easily supplied from the superabundance in another. The average quantity of corn exported during the decennial period of 1839—1848, amounted (exclusive of Poland) to about 4,400,000 tchetwerts. The three-course system is still common; indeed it is almost universally prevalent throughout Russia.

The total production of Flax in Russia has been estimated at 10 millions of poods (1 pood equals 36 lbs.), and that of Hemp at 6 millions. There were exported in the years 1847, 1848, 1849, 12½ million poods of Flax, and nearly 8½ million poods of Hemp, or about 21 million poods of both together, giving an annual average of about 7 millions. This in value may be taken as equal to 2,346,000*l.* When it is remembered that Flax and Hemp (including seed) are upon the whole the most important of all the Russian exports, and that more than 61 per cent. of all that is exported comes to England, and that on the other hand 62 per cent. of all the Flax and Hemp which comes to this country is imported from Russia, some idea may be formed of the prejudicial effects of war upon both countries in this one particular alone. The author has not overlooked the rapid increase of the exports of Flax from Ireland, and he examines the probability of a successful competition by Ireland with Russia in this article. In his opinion there is no cause for alarm for Russia, at least for the present. In each of the years 1846, 1847, 1848, the average quantity of Flax exported by Russia to England was about 3½ million poods, whilst in 1849 and 1850, when the exports from Ireland greatly increased, the average quantity supplied by Russia was more than 5½ million poods. It is the small cost of production which gives Russia the advantage over other countries as regards this important article, for in quality Russian Flax stands at the bottom of the list. The price of Riga Flax is to Irish (the next worst in quality) as 10 to 16.3; to Dutch as 10 to 18.4; to Flemish as 10 to 23; and to Courtray (the best) as 10 to 27; in other words, Russian Flax fetches 38 per cent. less than the next lowest quality, viz., Irish. England, again, is Russia's best customer for Hemp, and it is upon Russia that England is chiefly dependent for a supply of that article, for it appears that notwithstanding an increasing supply from the East Indies, 65 per cent. of all the Hemp imported by us in the years 1846-49 came from Russia. Nevertheless owing to the supplies from the East Indies, and the increasing use of cotton, sailcloth, and iron cables, the Russian exports of Hemp, to this country are gradually declining. Linseed also is principally exported to England; three-fifths of the Russian exported Linseed come to this country, and 79 per cent. of all the Linseed England imports are obtained from Russia.

Passing from vegetable to animal produce we find that in 1846, according to government returns, there were 25 million head of cattle in European Russia, and the average quantity of tallow exported in the years 1846-48 was 3,810,000 poods. The quantity of cattle exported is trifling; and yet in the provinces contiguous to the Black Sea and Sea of Azov cattle are, relatively at all events, superabundant—there being more than one head of cattle to each inhabitant. With respect to foreign breeds, the Dutch and Tyrolese seem to succeed best, whilst English cattle appear to be the worst adapted to the Russian climate and Russian treatment. Sheep farming, owing to the great demand for wool and the extensive pastures of Russia, was and still is very profitable; but the effect of the enormous quantities of excellent wool imported by England from Australia is seriously felt. The appearance of Australian wool in the markets of Germany, and the increasing demand for it there, is also calculated to alarm the Russian farmers. The author, however, is far from despairing as to the fate of his countrymen, provided they will pay more attention to quality. As it is, he says, "It is notorious that the washing and assorting of the wool—operations of great importance—are, with a few laudable exceptions, performed amongst us with such consummate slovenliness as to be elsewhere unparalled; and what is more, such is the ignorance and absurdity of some flock masters that they speculate on the increment of weight from dirt, and wash their sheep in muddy water in expectation that the fleece will thus bring in more money—the fact being that the price offered by the merchant, who is quite alive to the trick, is in consequence so small that the advantage redounds to him and not to the farmer." Great attention is paid in Russia to horse breeding, a matter of the highest importance in consequence of the large numbers of the Imperial Cavalry and of the immense demand for horses of all kinds for the purpose of intercommunication. The best horses are reared in the provinces of new Russia, and especially in the Governments of Taurida, Kherson, and Bessarabia, the country of the Don and Black Sea Cossacks, &c. In the Caucasian provinces and in Georgia there are numerous herds of horses of excellent breed, very suitable for light cavalry. The total number of horses in European Russia (excluding Finland) is computed to be upwards of 18,000,000, or about 9 horses for every 31 inhabitants, an enormous proportion as compared with France, Austria, and Prussia. The number of horses exported is very trifling. The author states at considerable length the means taken by the Government to improve the various breeds, but for these as well as other details reference must be made to his work itself.

The chief productions of the Crimea seem to be wine and fruit. In 1848 the number of Vines in the whole government of Taurida was 35½ millions. The wines themselves, however, are not much liked by those unaccustomed to them; the prices vary according to quality and sort from 3*d.* to 10*s.* per gallon. Apples and Pears are the principal fruits; of the former the rennet, and of the latter the St. Germain and virgouleuse (a winter Pear), are greatly cultivated. The Black Sea and Sea of Azov, moreover, abound in fish of the greatest variety. Amongst others there are the tunny, the salmon, the sea trout, anchovies, and herrings weighing as much as a pound and a half.

We take reluctant leave of this highly interesting work. It is well translated, and will, if furnished with a good index, take the place it deserves amongst standard works of reference.

* 1 tchetwert = 0·72 imperial quarters.

FLORICULTURE.

The Auricula.—Notwithstanding the severity of the winter, I have seldom seen my Auriculas look better than they do at the present time. They promise to bloom unusually well, and in order to strengthen and increase the size of the truss, I give them now and then a little weak manure water. In cultivating the Auricula, I have found that the principal care required is to keep the plants in a clean and healthy state, by removing all decayed leaves and keeping the pots and surface of the soil neat and tidy. The compost I use is made up in the following proportions, viz., 2 barrow-loads of cow dung, at least two years old; 1 do. of leaf mould; 1 do. of pure light loam, from an old pasture. These are well mixed together, and a sufficiency of silver sand added to keep the mass open and porous. During November, December, and January, if the weather is mild, I give the plants all the air I can. While they are at rest I occasionally give them a little water to prevent the foliage from becoming flaccid,

taking great care not to wet the plants themselves. The first mild weather in February I top-dress, by removing about an inch in depth of the surface compost, taking care not to disturb the fibres, and filling up to within a little of the foliage with new compost, having a portion of good old sheep dung mixed with it. After they are top-dressed, the plants must be set to work, by being regularly watered; towards the end of the month they will be growing rapidly—at which time protection is requisite from sudden and severe frosts. My stages face north-east; but, immediately after being top-dressed, I remove those plants intended for exhibition to a stage facing due south; and as they come into bloom, I remove them again to the north-east, where they only get the morning sun. During May, June, and July, the plants must be liberally supplied with water, and kept clear of decaying leaves and flower stems; at the same time look out well for a small black caterpillar, which attacks the centres of the plants, and if not caught in time, will leave only a naked stump. Green fly, also, must be removed, by carefully brushing them off. There is much difference of opinion respecting the time to repot Auriculas; there can be no doubt that early potting causes many of the plants to bloom in autumn, which weakens them and injures the spring bloom. My time for beginning this necessary operation is towards the end of July, so that I may have them all finished by the middle of August. The plan I follow is to shift two years consecutively, leaving a good ball of soil at the roots, and the third year to shake the whole of the compost from the fibres, and pot them afresh; when I require to do this I repot about a month earlier. The method I adopt in repotting is as follows:—For a full-sized plant I use a pot 6 inches wide and 7 deep, and for smaller plants and offsets pots varying from 3 to 5 inches wide. For draining I use first, a layer of broken crocks, then a layer of oyster-shells, convex side up; above this I place some vegetable fibre, to prevent the compost choking the drainage; I then fill in some compost; when this is done I examine the plant to be repotted, and reduce the ball of fibres with a sharp knife. I like to grow my plants with short stems, consequently the lower portion of the stem is well examined annually, and all decaying portions of it cut off, and the wound dressed with powdered wood charcoal to dry it up, and keep the plant healthy; the offsets are then slipped carefully off, and the part of the plant to which they adhered, dressed also with charcoal; the plant is then placed in the centre of the pot, which is filled up to within about half an inch of the top, care being taken to keep the foliage clear of the compost; a gentle stroke or two upon the bench will settle the soil, and should it sink much, I add what is necessary to complete the quantity. When the compost is shaken altogether from the plants, and the stem and fibres properly trimmed, the fibres require to be equally distributed over the soil in the pot, touching the side, and then filled up. Some cultivators have recommended keeping the plants in a dry state for a few days after re-potting. I have found injury to result from following this advice; therefore, they should be watered whenever completed. There is one fatal malady to which this fine flower is liable, viz, Rot. This may be attributed to two causes, viz., improper compost, and allowing water to lodge in the hearts of the plants. An experienced cultivator can instantly perceive by the peculiar smell when disease is in a collection: when a plant is seen with its head leaning to one side, and the outer leaves assuming a purple hue, having also a strong disagreeable smell, then rot has commenced. Plants so infected must be immediately removed to a distance from those in health, otherwise the whole collection may be swept off in a very short time. I have tried every sort of experiment to cure this scourge. The only remedy that was successful was to take the plant out of the pot, wash it well, and with a sharp knife cut away all infected parts, and dust the wounds with charcoal; and after allowing the plant to dry for a few hours, to re-pot it in a mixture of leaf mould, loam, and sharp sand. To guard effectually against rot, never allow the plants to receive any heavy rains, and purchasers cannot be too careful in having their plants from a healthy stock. These are precautions which every grower must attend to who wishes to have a healthy and fine display of this favourite spring flower. *L.*

SEEDLINGS.

Scarlet Geraniums: *J S G.* 1 is the best; it is a brilliant scarlet, but of the size and appearance of the truss we can form no opinion, as it had dropped to pieces before it reached us.

Calendar of Operations.

(For the ensuing week.)

PLANT DEPARTMENT.

Conservatory, &c.—Where the hardier kinds of stove twiners are grown for covering the rafters of the show-house, every possible attention must be afforded them this season, in order to induce an early healthy growth, for unless this is secured many of them will bloom but poorly, if at all. Give particular attention to the state of the roots, and endeavour to keep the soil in a nice moist healthy state; also avoid giving top air when not absolutely necessary for the other inmates of the house. Considerable attention and care are necessary to get these things to flower abundantly even in favourable seasons, and this season the spring has hitherto been so cold and unfavourable that without extra attention the growth of such things will be unusually late, and hence there will be but a poor chance of their blooming satisfactorily. The present is a favourable season for making any alteration among the conservatory twiners, and we would recommend those who have a large demand for cut flowers in winter to plant some of the finer Acacias to be trained to the rafters. These grow very rapidly, and when allowed plenty of space form objects of great beauty in winter, and early spring.

FORCING DEPARTMENT.

Pineries.—Plants swelling their fruit should be very carefully attended to with water at the root; for, if allowed to get too dry, there is great danger of checking the fruit and preventing its attaining the size which it would under proper treatment. It is, however, very easy to err in the opposite extreme, and considerable care and practice are necessary to enable one to properly water plants having their pots plunged; therefore this should not be intrusted to inexperienced hands, who would probably water every plant if the surface soil indicated dryness. Use weak tepid manure water for plants that are well rooted, whether fruiters or growing stock, and keep the atmosphere thoroughly moist, giving air very sparingly on cold, drying, gleamy days. Black Jamaicas and Montserats expected to supply ripe fruits at Christmas should soon be ready for shifting into their fruiting pots, and great care should be exercised to avoid checking their growth by any means, as this might lead to their fruiting prematurely. See to having the balls in a rather moist state at the time of repotting, and keep the bottom-heat regular and the atmosphere very moist and rather close until the plants appear to have taken to the fresh soil. The same attention will be necessary in watering, and bottom-heat, &c., in the case of those growing in the open bed, for plants that are any size are very apt to show fruit at this season if at all checked in their growth. Vineries.—Directly the fruit in succession houses is sufficiently advanced for thinning get this done, the laterals stopped, and the shoots regulated without loss of time, for allowing the berries to get so thick that the scissors can hardly be got amongst them renders thinning tedious, and also robs the Vines. Give inside borders a liberal supply of manure water, using that from the stable-yard tank where it can be obtained, and mixing with it a sufficient quantity of warm water to render it about milk warm. In all cases, give every possible attention to the state of the roots, securing a little artificial warmth where circumstances allow of doing so, for the ground is cold and very unfavourable for the roots of Vines. Where fermenting materials have been used on the border of the early house, the heat should not be allowed to decline until the fruit is fairly ripe, for it is much easier to secure a heavy crop of well swelled fruit than to perfectly colour and ripen even a moderate crop, and a healthy root action is perhaps more important while the fruit is colouring than at any other period. Therefore let the fermenting materials be turned occasionally, adding fresh as may be requisite to keep the temperature of the border at about 70°. In cases where red spider threatens to be troublesome, in succession-houses, rendering syringing necessary, rain water should be provided for syringing with, as if water containing lime is used, the berries are sure to be disfigured by an incrustation of lime, and we have seen a splendid house of Grapes disfigured through syringing with hard water. Figs.—To have this fruit in perfection, the trees should be rather dry at the root and the atmosphere rather dry and warm during the ripening period; but respect to the second crop often prevents proper attention being given to the ripening of the first. If care, however, is used to have the borders in a healthy state as to moisture, and rather inclining to dryness at the time the fruit begins to ripen, and save in the case of plants growing in pots or tubs, giving no more water at the root until the first crop is gathered, fruit of good quality will be obtained without risking the loss of the second crop. Plants in pots or tubs swelling a heavy crop of fruit will be benefited by an occasional watering with weak manure water.

FLOWER GARDEN AND SHRUBBERIES.

The weather continues most unfavourable for recently transplanted trees and shrubs, and nothing but careful attention will save large plants that have been shifted this spring, especially if in exposed situations. Do not allow anything to suffer for the want of water at the root, but one good soaking after planting to settle the soil about the roots will be sufficient in most cases until we have more sunshine to warm and dry the ground; for keeping the soil saturated will not be of any service in encouraging the production of active roots. The soil should be kept moist, but not saturated and run together by over watering as is sometimes done—a sprinkling overhead with the engine on the evening of drying days will be of more service to large evergreens than over-watering them at the root. See that all recently planted things, whether large or small, are well secured against the wind. The best way of effecting this in the case of large plants is to use three strong tarred cords for each, fixing them to the plant by means of a collar made of strong metallic wire, and thickly wrapped with canvas to prevent its injuring the bark, and tieing to strong pieces of Oak driven into the ground at a proper distance from the stem of the plant. This may be somewhat more expensive than staking, especially where stakes can be obtained without any outlay; but a plant once properly secured in this way may be considered safe against wind, as the ropes will last for years, and until the roots get sufficient hold of the ground. For specimens in prominent situations, metallic wires should be used instead of cords, being neater in appearance; and if somewhat expensive in the first instance, they will last a lifetime, and a little expense is of no importance compared with living in constant fear of having a favourite specimen blown down or injured by the wind. Take advantage of the dry state of the ground to stir and rake the surface soil of shrubbery and herbaceous borders to prevent the growth of weeds, and give a fresh neat appearance. Also plant out Wallflowers, double Rockets—young stock of herbaceous plants generally. Delphinium Hendersoni is one of the finest plants we possess in this way, and should have a place in every garden.

HARDY FRUIT AND KITCHEN GARDEN.

Be prepared with protection for the blossoms of fruit trees wherever this can be applied, for it will be nothing surprising if the present stormy weather should be followed by a few nights of sharp frost, and even if it should be true that frost does not injure the blossoms of trees that have been properly pruned, we would advise those who can command some kind of covering not to make the experiment. Thick coverings, which would keep light and air from the trees, should not be allowed to remain on during the day, for this would probably be as injurious as frost. See that recently planted trees are perfectly secured against the wind, and do not let them suffer for the want of water at the root. The main crop of Broccoli should be sown at once, also a bed of Couve Tronchuda, which is excellent for autumn and early winter use. A small breadth of Cabbage should also be sown for succession, as also Cauliflower, Lettuce, Turnips, &c. The best way of securing a regular succession of these is to sow small quantities frequently, and at stated intervals during the summer—say once every fortnight. Put in a few Kidney Beans on a warm border, and plant some in pots or turves, to be raised under glass, and planted out where they can be covered in case of frost. These will afford the chance of an early dish, and anything in the way of early vegetables will be doubly valuable this season. If not already done, Ridge Cucumbers, Vegetable Marrows, Cardoons, Tomatoes, and Capsicums should be sown in a warm frame, so as to have strong plants by planting-out time.

STATE OF THE WEATHER AT CHISWICK, NEAR LONDON.

For the week ending April 12, 1855, as observed at the Horticultural Gardens.

April 6—Fine; very fine; partially overcast.
— 7—Overcast; exceedingly fine; clear at night.
— 8—Low white clouds; cloudy and cold; slight rain.
— 9—Slight rain; cloudy; rain; boisterous.
— 10—Boisterous; hail occasionally; clear and boisterous.
— 11—Cloudy; rather boisterous; rain at night.
— 12—Clear; very fine throughout; slight rain.
Mean temperature of the week 8 deg. above the average.

RECORD OF THE WEATHER AT CHISWICK,

During the last 29 years, for the ensuing week, ending April 21, inc.

April.		Average Highest Temp.	Average Lowest Temp.	Mean Temp.	No. of Years in which it Rained.	Greatest Quantity of Rain.	Prevailing Wind.							
Sunday	15	57.7	39.1	48.4	17	0.47 in.	[illegible]							
Mon.	16	56.4	36.9	46.6	12	0.63	[illegible]							
Tues.	17	57.1	36.1	46.6	14	0.32	[illegible]							
Wed.	18	57.6	37.2	47.4	13	0.49	[illegible]							
Thu.	19	58.4	36.8	47.1	7	0.45	[illegible]							
Frid.	20	59.5	36.8	48.2	14	0.39	[illegible]							
Satur.	21	58.4	39.3	48.8	13	0.28	[illegible]							

The highest temperature during the above period occurred on the [illegible] 1854—therm. 77 deg.; and the lowest on the 16th, 1847, and 19th, 1848—therm. 20 deg.

Notices to Correspondents.

Asparagus: *T B P.* The general opinion is that there is but one sort of Asparagus, and that the so-called varieties are merely the result of differences of cultivation. The matter is, however, undecided. Our own opinion is that there are more sorts than one. ‡

Dioscorea Hatatas: *R J M.* It has been advertised by some nurserymen; see our paper of the 10th ult., p. 149. ‡

Insects: *S F.* Your insect is the young state of the Rove Coach-horse, Staphylinus (Goerius) olens. You must not destroy it, as it feeds upon worms and other obnoxious grubs. ‡

Names of Plants: We have been so often obliged to remark that we decline naming heaps of dried or other plants, that we were in hopes to request our correspondents to recollect that we never have, or could have undertaken an unlimited duty of this kind. Young gardeners, to whom these remarks more especially apply, should bear in mind that, before applying to us for assistance, they should exhaust their other means of gaining information. We cannot save them the trouble of examining and thinking for themselves; nor would it be desirable if we could. All we can do is to *help* them—and that most willingly. It is now requested that, in future, not more than four plants may be sent us at one time.—*F C S.* The species of Cupressus cannot be recognised by fragments. No doubt C. macrocarpa and Lambertiana are the same species.—*T W.* Jatropha panduræfolia.—*O P.* We cannot recognise your Salvia from so small a bit. It may be S. pulchella. As regards S. splendens, see an article by "Alpha" in another column. ‡—*W Fane.* Catasetum intermedia, a dark variety; and a Vanda that seems to be quite new. You will see further mention of it hereafter.—*F* [illegible] It looks like a bit of Silene arenaria; but the specimen is too small for identification.

Oranges: *L C.* They may be grafted now if they have not begun to grow. We would, however, prefer inarching to grafting. ‡

Vines: *Woolton.* There is no objection to stopping the progress of your Vine-roots by an underground wall. The other inquiry is answered in a leading article.

Misc: *Sub.* Melilotus leucantha is the plant otherwise called Bokhara Clover. Magnetic observations do not fall within the scope of this Paper.

PERUVIAN GUANO, Bolivian Guano, Superphosphate of Lime, Nitrate of Soda, Sugar Scum, and every description of Artificial Manures, Linseed Cakes, &c.
WM. INGLIS CARNR, 10, Mark Lane, London.

WHEAT AND OTHER MANURES ON SALE.—The success attending the application of the manure especially adapted for Wheat during the last two years, induces the undersigned to again offer it to the Agriculturists with confidence. Also Superphosphate of Lime, Blood Manure, Guano, Nitrate of Soda, Gypsum, Salt, Peat Charcoal, and all other Manures of known value.—Apply for Prices Current to MARK FOLLISHILL & CO., 264a, Upper Thames Street, London.

CORN MANURE FOR SPRING SOWING.
CONCENTRATED URATE FOR GRASS, RAPE, AND ALL ROOT CROPS.
SUPERPHOSPHATE OF LIME.

THE LONDON MANURE COMPANY continue to manufacture the above Manures, which have been used with such success for the last 14 years.

The London Manure Company also supply PERUVIAN GUANO (direct from importers' warehouses), Nitrate of Soda, Sulphate of Ammonia, Fishery and other Salts, Bone Dust, and every artificial manure of known value. EDWARD PURSER, Sec.
Office—40, Bridge Street, Blackfriars.

THE FOLLOWING MANURES are manufactured at Mr. LAWES' Factory, Deptford Creek:—Turnip Manure, 7l. per ton; Superphosphate of Lime, 7l.; Sulphuric Acid and Coprolites, 6l.
Office, 69, King William Street, City, London.
N.B. Genuine Peruvian Guano, guaranteed to contain 16 per cent. of ammonia. Nitrate of Soda, Sulphate of Ammonia, and other Chemical Manures.

ARTIFICIAL MANURES, &c.—Manufacturers and others engaged in making ARTIFICIAL MANURES may obtain every necessary instruction for their economical and efficient preparation, by applying to J. C. NESBIT, F.G.S., &c., Principal of the Agricultural and Chemical College, Kennington, London. Analyses of Soils, Guanos, Superphosphates of Lime, Coprolites, &c., and Assays of Gold, Silver, and other Minerals, are executed with accuracy and dispatch.

Gentlemen desirous of receiving instructions in Chemical Analyses and Assaying, will find ample facility and accommodation at the College.

ESTABLISHED 1850.

THE NITRO-ORGANIC MANURE COMPANY,
(Late the Manchester Sewage Guano Company),

Have much pleasure in informing their Friends and Agriculturists generally, that in order to secure the most complete arrangements in all the Chemical Processes in the Manufacture of their Manures, they have engaged the professional services of Dr. EDWARD FRANKLAND, F.R.S., F.C.S., Professor of Chemistry at Owen's College, Manchester, to analyse all the various Manures made daily at their Works, and they have empowered him to reject every portion which is not found to be of the full standard quality. This arrangement will secure to all their customers a standard and uniform manure, of equal or greater value (in proportion to its cost) than foreign guano, and on which agriculturists may confidently rely.

The Nitro-Organic Manures are a Compost of Blood, Bones, Urine, Nightsoil, and other animal matters, and highly fertilising Chemical Ingredients, which, in a concentrated state, are incorporated with prepared Charcoal, and forming dry portable manures, which enrich the land for several years after they are applied. They may be used in all cases, exactly the same as Peruvian Guano, *at equal cost per acre.*

For top-dressing, the Manure is recommended to be applied in all cases in wet or showery weather. If convenient, the Nitro-Organic Manures may be used with very beneficial effect along with a small dressing of common farm-yard manure, or nightsoil, in which form they have been strongly recommended.

PRICES OF THE NITRO-ORGANIC MANURES.

For Grass, Clover, &c.	£5	5	0	per ton.
For Wheat, Oats, Barley, Rye, &c.... ...	6	6	0	"
For Turnips, Mangold Wurzel, & Potatoes	6	6	0	"
Deodorising Charcoal...	1	10	0	"

TERMS—Net Cash on delivery; Carriage Free to any Railway Station or Canal Wharf in Manchester.

JOHN THOMPSON, Secretary.
Watling Street, Shudehill, Manchester, March, 1855.

*** The use of Sewage having for some time been discontinued, the opportunity presented by a change in the late Company has been taken to alter the name to one more characteristic of the actual constituents of the Manure.

THE PATENT NITRO-PHOSPHATE OR BLOOD MANURE COMPANY.—Provisionally Registered pursuant to the Act 7 & 8 Vict. c. 110.

Trustees.

Abel Smith, Esq., Jun., M.P., 2, Halkin Street West.
Charles Dimsdale, Esq., Essendon Place, Herts.
Edward Ball, Esq., M.P., 8, Belgrave Road, Pimlico.
Major-Gen. Hall, M.P., Weston Colville, Linton, Cambridge.
John Brady, Esq., M.P., Warwick Terrace, Belgrave Square.

Directors.

Chairman.—Jonas Webb, Esq., Babraham, Cambridgeshire.
Deputy-Chairman.—John Sharp, Tower Villa, Queen's Road, Regent's Park.

Edward Bell, Esq., Tottenham, Middlesex.
John Clayden, Esq., Littlebury, Essex.
Richard Hunt, Esq., Stanstead Abbot, Herts.
Thomas Knight, Esq., Edmonton, Middlesex.
Robert Leeds, Esq., West Lexham, Norfolk.
Robert Morgan, Esq., 72, Camden Villas, Camden Town.
Thomas Nash, Esq., Great Chesterford, Essex.
James Odams, Esq., Bishop Stortford, Herts.

John Collins, Esq., Middleton Square, Pentonville.
With power to add to their number.

Bankers.—Messrs. Barnett, Hoare & Co., Lombard Street.
Auditor.—James Caird, Esq., Baldoon, and 9, Little Ryder Street, St. James's.
Solicitors.—Messrs. Kingsford & Dorman, 23, Essex St., Strand.
Secretary and Chemist.—James Taylor, Esq., F.C.S.
MANUFACTORY, PLAISTOW MARSHES, ESSEX.

The Directors of the above Company beg to call the attention of their friends and the Agricultural Community to their Blood Manures for Corn and Turnips, which have been used with the greatest success in all parts of England, and to assure them that having now erected commodious Works, with every suitable convenience for carrying on the manufacture on a large scale, under the management of an experienced practical Chemist, the Agriculturists of this country may depend upon having a manure of proved high quality, which the Directors guarantee to be genuine. It is sent out in the form of a fine friable powder, which may be sown by the drill or hand with the utmost facility.

They beg to caution the public against the attempts of spurious imitators, who, since the introduction of this Manure, have proceeded to make one possessing similar qualities. As security, therefore, to the purchaser, every bag is marked "Odams' Patent Blood Manure," and sold only by the authorised Agents of the Company.—Corn and Grass Manure, 7l. 10s. per ton.

Directions for Use.—From 2 to 3 cwt. per acre, according to the condition of the soil. It may either be drilled in with the Seed, or sown broadcast; if the latter, it should be well harrowed in. Turnip Manure, 6l. 10s. per ton.

Delivered at any Railway Station or Wharf in London.

Applications to be made to ODAMS, PICKFORD, & KEEN, Agents for the above, 35, Leadenhall Street, London.

MANURE.—Pure animal carbon in powder, and free from moisture, containing by analysis 7·33 per cent. of nitrogen, equivalent to about 9 per cent. of ammonia. To be had at 7l. per ton, bags included, delivered at any Railway in Town.—Mr. WITTY, Chemical Works, Belle Isle, near King's Cross, London.

THE LANDS IMPROVEMENT COMPANY, INCORPORATED BY SPECIAL ACT OF PARLIAMENT FOR ENGLAND AND SCOTLAND.—To Landowners, the Clergy, Solicitors, Surveyors, Estate Agents, &c.—Loans may be contracted for the execution by the proprietor or by the Company of every landed improvement, especially Drainage, Building, Clearing, Enclosing, Warping, Irrigation, Embanking, Reclamation, Roads, Planting, Machinery, &c. The plans (of buildings), specifications, and estimates are prepared by the proprietors, and are submitted to the approval of the Enclosure Commissioners. Proprietors may avail themselves of the powers of the Act to recover from the inheritance their own funds to be expended on improvements. They may also apply jointly for the execution of a mutual improvement, such as a common outfall, &c. For forms of application, &c., apply to the Hon. WM. NAPIER, Managing Director, 2, Old Palace Yard, Westminster.

THE GENERAL LAND DRAINAGE AND IMPROVEMENT COMPANY
INCORPORATED BY SPECIAL ACT OF PARLIAMENT.
Offices, 52, Parliament Street, London.

DIRECTORS.

HENRY KER SEYMER, Esq., M.P., *Chairman.*
SIR JOHN V. SHELLEY, Bart., M.P., *Deputy-Chairman.*

George Thomas Clark, Esq.
John C. Cobbold, Esq., M.P.
Sir William Cubitt, F.R.S.
Henry Currie, Esq.
Thomas Edward Dicey, Esq.
William Fisher Hobbs, Esq.
Edward J. Hutchins, Esq., M.P.
Sir S. M. Peto, Bart.
William Tite, Esq., F.R.S.
William Wilshere, Esq.

Empowered to execute Drainage, Road-making, and other Land Improvements, and to Erect Farm Buildings upon Estates under Settlement, Mortgage, or otherwise; or Church property, and without investigation of Title to charge the whole outlay and expenses upon the Estate, to be repaid by instalments spread over any period determined by Landowners within the limits of 50 years for Drainage and Roads, and 31 years for Farm Buildings.

Landowners may arrange with the Company for the execution of the works by their own agents, with the use of their own or the Company's Capital. WILLIAM CLIFFORD, Sec.

ROYAL AGRICULTURAL SOCIETY OF ENGLAND.

PRIZE SHEETS and CERTIFICATES of ENTRY for the CARLISLE MEETING may be had on application to the Secretary of the Society, 12, Hanover Square, London; to whom all Certificates for Implements must be sent by the 1st of May, and all Certificates for Stock by the 1st of June.

ROYAL AGRICULTURAL COLLEGE, CIRENCESTER.
PATRON—His Royal Highness PRINCE ALBERT.
PRESIDENT OF COUNCIL—Earl BATHURST.
PRINCIPAL—Rev. J. S. HAYGARTH, M.A.

PROFESSORS, &c.

Chemistry—J. A. C. Voelcker, Ph.D., F.C.S.
Zoology, Geology, and Botany—John Buckman, F.G.S., F.L.S.
Veterinary Medicine and Surgery—G. T. Brown, M.R.C.V.S.
Surveying, Civil Engineering, and Mathematics—F. Armstrong, C.E.
Manager of Farm—G. Austin.

Students are admitted after the summer and winter vacations, also in April and October. The Annual Fees for Boarders vary from forty-five to eighty guineas, according to age and other circumstances. The Fee for Out-Students is 40l. per annum. The College Course of Lectures and Practical Instruction is complete in one twelvemonth—although a longer course is recommended. There is a department for general as well as for agricultural purposes. Prospectuses and information can be had on application to the Principal.

COLLEGE OF AGRICULTURE AND CHEMISTRY, AND OF PRACTICAL and GENERAL SCIENCE, 37 and 38, Lower Kennington Lane, Kennington, near London.
Principal—J. C. NESBIT, F.G.S., F.C.S., &c.

The system of studies pursued in the College comprises every branch requisite to prepare youth for the pursuits of Agriculture, Engineering, Mining, Manufactures, and the Arts; for the Naval and Military Services, and for the Universities.

Analyses and Assays of every description are promptly and accurately executed at the College. The terms and other particulars may be had on application to the Principal.

PRUNING.

THE GRECIAN PRUNING SAWS are universally acknowledged to be the best for every description of Pruning. They cut faster and cleaner than any other, and do not bend or break. Price 2s. 6d., 3s., and 3s. 6d. each.
THOMAS HILL, late W. Coleman, 4, Haymarket, London.

CAUTION.

PARKES' STEEL DIGGING FORKS AND DRAINING TOOLS.

Whereas very inferior descriptions of Steel Digging Forks are now manufactured and sold, and I have been informed that purchasers of the same have believed them to be the same as those manufactured by me, and to which the Royal Agricultural Society and numerous Agricultural Societies' prizes have been awarded, I hereby respectfully inform the public that every Fork manufactured by me is stamped with my trade mark "J. P.," and that Messrs. BURGESS & KEY, of No. 103, Newgate Street, London, are my sole Wholesale Agents, and I have authorised them to replace to the purchaser every Fork of my manufacture found defective; they will also on application send Wholesale and Retail Price Lists, &c., post free. FRANCIS PARKES & CO.

CLAYTON, SHUTTLEWORTH, AND CO.'S PRIZE PORTABLE STEAM ENGINES, AND COMBINED THRESHING, STRAW SHAKING, RIDDLING AND WINNOWING MACHINE may be seen at their London Establishment, 6, Fitzroy Terrace, New Road, where all information relative thereto can be obtained. These Machines are constructed to horn Barley, and make a perfect separation of the chaff from the pulse. They are fitted with Elevators, which deposit the grain into bags, and beyond the feeder of Machine require no hands except to take away the Corn, &c., as threshed, the whole of the operations being performed by self-acting machinery, whereby the Corn, Straw, Chaff, and Pulse are delivered in the places assigned for them.

C. S. & Co. have paid special attention to this class of Machinery, and Fixed Barn Machinery, and from the position they have taken at the Royal and all the leading Agricultural Shows of England, flatter themselves that for efficiency, durability, and simplicity, their Engines and Machines are not surpassed by any other maker in England. All letters forwarded to the Works at Lincoln will have immediate attention; and Illustrated Catalogues forwarded to all parts of the kingdom postage free.

THE AGRICULTURAL MACHINERY DEPARTMENT of the CRYSTAL PALACE IS NOW OPEN for PUBLIC INSPECTION. It contains the largest and most complete collection ever exhibited, comprising the most approved Agricultural Implements and Machines by all the first-rate makers. By Order. GEO. GROVE, Secretary.

TREE TRANSPLANTING BY M'GLASHEN'S PATENT.

MR. M'GLASHEN is now prepared to supply Apparatus or give Estimates as to the rate at which he will safely and expeditiously transplant Trees or Shrubs of any dimensions in any part of the United Kingdom.
Canonmills Bridge, Edinburgh.

SCYTHES.

BOYD'S PATENT SELF-ADJUSTING SCYTHES may be had of the Manufacturers, WILLIAM DRAY & Co., Swan Lane, London; and of all Ironmongers and Seedsmen. A liberal allowance to the trade.

INGLIS AND CHISHOLM, Charles Street, Garratt, Manchester, make STEAM ENGINES for Agricultural and other purposes of the best quality at a reasonable price.—Address INGLIS & CHISHOLM, Charles Street, Garratt, Manchester.

DO YOU BRUISE YOUR OATS YET?—One bushel of Oats when Crushed will make two. Great saving. OAT BRUISERS, Chaff-cutters, Ploughs, Threshing-Machines, Flour Mill Carts, Corn Dressing do., Horse and Steam Machinery put up, &c. Book on Feeding, 1s.
M. WEDLAKE, 118, Fenchurch Street, London.

"FRIGI DOMO."—Patronised by her Majesty the Queen, the Duke of Northumberland for Syon House, His Grace the Duke of Devonshire for Chiswick Gardens, Professor Lindley for the Horticultural Society, Sir Joseph Paxton for the Crystal Palace, Royal Zoological Society, Mrs. Lawrence, of Ealing Park, and — Collier, Esq., of Dartford.

PROTECTION FROM MORNING FROST.

"FRIGI DOMO," a Canvas made of patent prepared Hair and Wool, a perfect non-conductor of Heat and Cold, keeping, wherever it is applied, a fixed temperature. It is adapted for all horticultural and floricultural purposes, for preserving Fruits and Flowers from the scorching rays of the sun, from wind, from attacks of insects and from morning frosts. To be had in any required length, 2 yards wide, at 1s. 6d. per yard run, of ELISHA THOMAS ARCHER, whole and sole manufacturer, 7, Trinity Lane, Cannon Street, City, and the Royal Mills, Wandsworth, Surrey; and of all Nurserymen and Seedsmen throughout the kingdom.
"It is much cheaper than mats as a covering."

STEPHENSON AND PEILL, 61, Gracechurch Street London, and 17, New Park Street, Southwark, Manufacturers of Copper Cylindrical and Improved Conical Iron BOILERS, and Conservatory and Hothouse Builders, either in Wood or Iron, respectfully call the attention of the Nobility, Gentry, and Nurserymen to their simple but efficacious method of warming Horticultural and other Buildings by Hot Water.

From the extensive works they have executed, references of the highest respectability can be given, and full particulars furnished on application.

PRIZE MEDAL—1851.
AT A VERY ECONOMICAL RATE.

SAMUEL CUNDY, MASON and BUILDER, PIMLICO MARBLE and STONE WORKS, Belgrave Wharf, Lower Belgrave Place, Pimlico, London.

Marble Chimney-pieces manufactured by improved machinery. The public are invited to view the stock, unequalled for quality and price. A good Marble Chimney-piece for 40s. Marble Work in all its branches at a remarkably cheap rate for Halls, Dairies, Larders, &c. Circulars sent on application.

N.B. The "Royal Blue" Omnibuses pass the Works every ten minutes from the Bank.

MAW'S ENCAUSTIC TILE PAVEMENTS form an indestructible and highly decorative substitute for ordinary flooring, and their imperishable Oil Cloth Coverings for Entrance Halls, Passages, Verandahs, Conservatories, &c.—MAW & Co. send free of expense their Book of Designs, suitable in price and style for every description of Building.—Benthall Works, Broseley, Salop.

WATERPROOF PATHS.
BARN AND CATTLE SHED FLOORS.

THOSE who would enjoy their Gardens during the winter months should construct their walks of PORTLAND CEMENT CONCRETE, which are formed thus:—Screen the gravel of which the path is at present made from the loam which is mixed with it, and to every part of clean gravel add one of sharp river sand. To five parts of such equal mixture add one of Portland Cement, and incorporate the whole well in the dry state before applying the water. It may then be laid on 2 inches thick. Any labourer can mix and spread it. No tool is required beyond the spade, and in 48 hours it becomes as hard as a rock. Vegetation cannot grow through or upon it, and it resists the action of the severest frost. It is necessary, as water does not soak through it, to give a fall from the middle of the path towards the sides.

The same preparation makes first-rate paving for BARNS, CATTLE-SHEDS, FARM-YARDS, and all other situations where a clean, hard bottom is a desideratum. May be laid in winter equally well as in summer.

Manufacturers of the Cement, J. B. WHITE & BROTHERS, Milbank Street, Westminster.

The Agricultural Gazette.

SATURDAY, APRIL 14, 1855.

MEETINGS FOR THE ENSUING WEEK.

WEDNESDAY, April 18—Agricultural Society of England.

ON Tuesday, April 24, one of the largest and finest herds of SHORT-HORNS in England, and therefore in the world, is to be distributed. During the past few years it has been laboriously and expensively collected, and now for reasons which are, we presume, of no public interest Mr. STRAFFORD is to scatter it. Mr. TANQUERAY has been known among short-horn breeders for some years past as an attendant and buyer at sales of well-bred stock, and he has collected at Hendon, near London, a herd of about 100 animals, whose prices will, we doubt not, maintain the reputation of the short-horn breed. Many of these are very nearly related to the Kirkleavington blood, and thus (as appears in the valuable letter which we publish to-day from Mr. WOOD) related to several of the best tribes into which the breed is divided. The Oxford family is largely represented; Oxford 11th and 16th among the cows and heifers, and the 6th and 7th Dukes of Oxford among the bulls, will no doubt create extraordinary competition. Oxford 11th was bought at Tortworth by Mr. TANQUERAY for 250 guineas,

and Oxford 16th, then a three months calf, was bought for 180 guineas. The sixth Duke of Oxford—just a yearling—is from the first of these cows; the other bull is from Oxford 6th, a cow bought by Mr. Tanqueray, at Tortworth, for 200 guineas. Besides these there are animals with many crosses of the Duchess blood in them which will doubtless fetch very high prices. Seventy-seven cows and heifers and 23 bulls and bull calves will be offered for sale on April 24th, and American and French will bid against English breeders for their possession. The reputation of Mr. Bates, of Lord Ducie, and of many other breeders, as well as that of Mr. Tanqueray, will be maintained by the result. It is very much to be regretted on national grounds that a gentleman who has at such a cost of time and means done much to improve and encourage the breeding of short-horns, should thus have determined to abandon the pursuit.

Mr. Lock has recently published an appendix to the fourth edition of his excellent work "Ireland's Recovery," that supplies a want generally experienced in making investments in the purchase of Irish estates. The mode of valuing land is methodically managed in England, and the condition of it when about to be transferred from one proprietor to another is easily ascertainable. Our area comparatively with that of Ireland is divided into larger farms, held on shorter leases, and occupied by tenants who more punctually pay their rents, and are prepared to surrender their farms at the expiration of their leases, if either party wishes to sever the connection; and if the tenant does not faithfully observe the covenants under which he binds himself, the law affords an easy remedy to the injured landlord. There are also many smaller holdings under yearly tenancy, in which cases six months' notice on either side is sufficient to conclude the temporary agreement, and in many instances without liability on the part of the landlord to allow compensation for any improvements made by the tenant; but though legally there may be no obligation on the English landlord in the latter case to make any compensation, it is the custom in some portions of the midland counties to do so, under peculiar circumstances. These instances are locally understood by the valuators, and rarely produce any difficulty whatever.

If a proprietor of land wishes to sell it, and has a right to do so, no difficulties arise from the circumstances of the occupying tenants; and the principle of valuing the property is simple, and, we believe, nearly uniform in England. One or more professional land surveyors are employed to examine into the details of each farm, with its labourers' cottages, &c. A map of reference is before them (where a tithe or parochial map exists this is the guide), with each field, coppice, &c., specified and numbered upon it. The valuator criticises the qualities of the soil and subsoil, and notes the acreable value. The timber is perhaps valued in detail, or not unfrequently a certain sum is demanded for it in the gross. The condition of the farm houses, the repairs to be executed, the deficiencies to be supplied, the drainage necessary, are of course estimated also by the valuer, who takes into consideration the amount of land-tax or other charges payable by the landlord, and the probable amount of tithes, poor taxes, and parochial rates chargeable to the tenants. From such data he ascertains the just acreable value, referring to the local prices of agricultural produce as a standard. From his return the value is accurately fixed, and the estate changes ownership without difficulty, and at the average rate of about 20 years' purchase.

But in Ireland the application of the English principles alone is often insufficent to meet the cases submitted to the valuer. Mr. Lock's practical remarks on the subject are extremely interesting in a statistic point of view and important in themselves. We shall give them in an epitomised form, regretting that our limits of space do not admit of them being transferred to our columns *in extenso*. To carry out the details of the Poor Law in Ireland the first valuations were made "by isolated individuals at different periods, without co-operation, or reference to any fixed schedule of prices." To attain something definite and uniform, Government valuations were made in the years 1839, 1846, and 1852. The first was called the Ordnance or Townland Valuation, and was based on the then current prices of agricultural produce, viz.—

Schedule of Prices adopted under the Townland Valuation, 6 & 7 Wm. IV., c. 84.—Per cwt. of 112 lbs.

Wheat.		Oats.		Barley.		Butter.		Beef.		Mutton.		Pork.		Potatoes.		Flax.
s.	d.	s.	d.	s.	d.	s.	d.	s.	d.	s.	d.	s.	d.	s.	d.	
0	6	6	0	7	0	69	0	33	0	34	6	25	6	1	7	Not included in Schedule

It was intended to form a uniform and relative valuation, the Townland (the smallest denomination of land possessing permanent boundaries) being made the unit of valuation.

The second valuation was upon an estimate of the net annual rent which each tenement might be reasonably expected to bring, all rates, insurances, repairs, and public charges (except tithe-rent charge) being paid by the tenant. At that period the value of agricultural produce was as follows—

Schedule of Prices adopted under the Tenement Valuation, 15 & 16 Vict., c. 63, with Supplement of 17 Vict., c. 8.

Per cwt. of 112 lbs.

Wheat.		Oats.		Barley.		Butter.		Beef.		Mutton.		Pork.		Flax.		Potatoes.
s.	d.	s.	d.	s.	d	s.	d.	s.	d.	s.	d.	s.	d.	s.	d.	
7	6	4	10	5	6	65	4	35	6	41	0	32	0	49	0	Not included in Schedule

Then came the last acts, with a new reference standard of prices, from which schedule Potatoes are omitted, and Flax included, the valuations previously made remaining fixed until they shall be revised under the act, so as to present one uniform scale of value.* It appears two of the provinces, with the exception of the counties of Longford and Clare, are under the latter (or Tenement) valuation; the other parts are under the Ordnance valuation. When the Tenement valuation, that is of "the rateable hereditament under the provisions of the Poor Law" shall be completed, the valuation of each Poor Law union, &c., is to continue fixed for 14 years, when a revision may be ordered by the authorities.

A British intending purchaser of Irish land property must find it an advantage to be informed of those details. Nor will he think it superfluous information that the county cess is paid by the occupier or tenant, who is also liable to half the poor rates: and though the other moiety is chargeable to the landlord, with the whole of the tithe-rent charge, (which however does not exceed 11*d.* in the 1*l.* on the net rental of the country) "the amount of Poor Law taxation now happily diminishing throughout Ireland will not be a serious discouragement when it is considered that the very circumstance of an independent and employing capitalist becoming the proprietor of a hitherto insolvent estate must necessarily result in the reduction of local taxation." Then it must be borne in mind that land in Ireland is valued lower in comparison with its productive capabilities than land in England, the superior farming of the latter causing the average produce per acre to exceed our returns by about one-third. From this it is easily apprehended how agricultural skill applied to Irish land will yield the purchaser an increased per-centage on his investment, or, in other words, reduce the number of years purchase, as estimated on the increased productive value under improved culture. It is pleasing to find that even the Peat moors in the west of Ireland, which hitherto have been classed under the head of waste land—to a great extent, too—are found to be giving larger comparative returns for draining, &c., than the richer soils. The Scotch sheep farmers have found this out; their hardy Irish sheep are quite at home, or perhaps better than they would be in their native highlands, on the green pasturage to be found on the shallow Irish bogs.

* Mr. Lock's third table shows the average prices at the commencement of 1855:—

Per cwt. of 112 lbs.

Wheat.		Oats.		Barley.		Butter.		Beef.		Mutton.		Pork.		Flax.		Potatoes.	
s.	d.	s.	d.	s.	d.	s.	d	s.	d.	s.	d.	s.	d.	s.	d	s.	d.
17	3	9	0	9	6	94	6	48	0	53	0	45	6	60	0	5	6

There is also a table showing the present value in years, &c. of a lease for any certain term which it may be desirable to purchase.

YOUTH.—CRIME.—PUNISHMENT.

(TWO LETTERS.)—No. II.

It is a favourite adage and one which appears to reflect no little of the free spirit of our Courts of Criminal Law—that 'It is better 20 guilty men should escape than that one innocent man should be wrongfully convicted.'

Those who are old enough to remember poor 'Matthews at Home' may be able to recall the stage-coach scene of a very talkative travelling lady, the headlong plausibility of whose discourse is doomed to be from time to time tripped up by a gruff old gentleman in an enormous throat-wrapper, which his mouth only surmounts at the most provoking intervals, just to utter the words—

"That's *another* vulgar herror!"

The indignation of the good lady's face as the rude and repeated blows from this travelling sledge-hammer keep smashing the best links in the chain of her mail-coach oratory, is suggested by the bare thought of a point-blank contradiction of the above adage about innocent and guilty men. But it may as well be spoken out at once: it *is* an error, and an error based upon an error.

Try it in this shape. "It is better that 20 rotten sheep should be turned loose amongst the flock than that one sound animal should be submitted, without occasion, to the doctor." Or thus, "It is better that 20 typhus patients should be billeted on the town than that one person, free from the disease, should be sent to the hospital." Or, once again, thus—"It is better that 20 dangerous lunatics should be set at large than that one man of sound mind should undergo treatment for insanity."

If the 'treatment' be, in each case, cruel, ignorant, and antiquated—Yes! If enlightened and discriminating—No! Because, a few days would end the mistake; and meantime no suffering would befal the supposed 'patient,' because none would be required or practised.

When shall our Gaols have their 'Quetelet,' 'Winslow,' and 'Conolly!' When will the 'Punishment' for *moral*-insanity follow the drum that has beaten the retreat of the straight-waistcoat and the scourge from the abodes where infirmity *of intellect* is sad enough—but a good deal milder and safer without them.

The truth is, that in our dealing with the criminal we cannot, and we *do not*, get our own minds clear rid of the idea of vengeance. Alas, for poor human nature! you shall see it start, now, at the very shadow of *the word*, but the substance is there still, barbed like a fish-hook, rooted deep and firm; hidden away from *self*, most carefully and most tenaciously. In vain we try metaphysical conclusions with the young Ignorance standing impersonate before us, telling him we 'punish' him for his own good. The obedient air conveys the sounding paradox to his outer ear: 'the voice is the voice of Jacob, but the hands ——!' as Mr. Bumble bears him away, roughly, though unresisting. Did you ever chance to notice, after some kind and gentle-voiced magistrate or judge had almost called up the forgotten tear of sorrow and penitence to the face of conscious guilt, how, the very instant the last syllable, hung upon by a solemn and silent assembly, has dropped from his lips—how Mr. Bumble, with his "Come along!" and a shove and a pull to correspond, dislocates the whole fabric in the twinkling of an eye-lash! Mr. Bumble is your true 'practical man.' He has been listening all the while with impatience withheld only by 'respect for the Court,' or magistrate, (whose 'hignorance o' the natur' o' them young varmints' he unfeignedly pities in his secret soul) till *his* turn comes. And then! the voice and hand of vulgar authority compelling, back to the precious acquaintance which prison has 'introduced' him to, goes the little culprit, a new soul waiting upon the Stygian shore beyond which lies the land of Universal-crime-specific, "Three months' Hard-Labor," "Six months' *Hard*-Labor," "Twelve months' Hard-Labor."

Talk of quackery and Morrison's Pills! Why this beats anything that the most stolid empiricism ever dared or dreamt of. For, look you, Justice Morrison, you do not understand the moral pharmacopœia you pretend to dispense from! This Pill of yours which you prescribe as a 'hard' and bitter drug is, all the while, your patient's proper *Food!* Teach him but to believe *that* not so 'hard' as he supposes; make *that* but pleasant in his eyes—show him that when *the ground* was cursed for man's sake, *that* was the occult inherent blessing, the precious flower entwined by merciful Omniscience within the thorns and brambles that sprung from man's first disobedience—that The Hand which made both Man, and Labour, could mitigate, unite and reconcile the lot, till it should be inseparable from the happiness of the *forgiven* sinner—that unlike earthly power, the *creative* Hand could withdraw the penalty without altering the sentence: that from that same 'Labour' which you have now stigmatised for ever in the culprit's mind by an epithet as ugly as it is false—springs all that makes man healthy, wealthy, wise, and happy! all that enriches, instructs, and ennobles, all the difference physical, intellectual, moral, that stands between, and separates him the poor, ignorant, Prisoner, from you the wealthy, learned, Judge! And this talisman of earth—this golden key that unlocks every door, you, as far as in you lay, have dissociated for ever from his hand and will! Blind leader, of the blind! putting bitter for sweet and sweet for bitter!

What said the immortal Howard this eighty years ago! "Make a man industrious, and you will make him honest." This was his favourite aphorism. Now if anybody but Howard had said this, who amongst us would ever have dreamt of its having the remotest application to the genus *Homo* that has its habitation on the wrong side of Prison walls! For, according to the popular doctrine, and practice of the criminal law, so soon as the terra incognita included in those walls is reached, all human motive and propensity become reversed; the Tender now goes before the Engine. Labour, the producer, and the sweetener, of Food, is henceforward to be unproductive 'by Act of Parliament,' and the decrees of pseudo-political-economists. Breakfast, dinner, and supper drop from the skies, and have no more to do with divinely-appointed labour than with the passing clouds that form the day-landscape, or the starry segment of the celestial-globe bequeathed by departed earth to the prisoner's nocturnal eye,—though alas! without the "knowledge" that night should give to night. Everything, as in dream, interpreting, is henceforward to go by contraries; instead of its being a man's interest to keep in health, he swallows his soap at washing time as a note-of-invitation to Diarrhœa, and the comforts of the Gaol-Infirmary, or "wilfully seeks his own salvation" by rupturing himself for life, to escape 'such a getting up

stairs' as that presented by the barren orbit of the Treadwheel, and so slips the yoke of 'Hard-labour' for evermore.

What a practical commentary upon the 'punishment' of '*Hard*-labour'! What a justification of itself by outraged natural Truth! *Naturum expellas furcâ, tamen usque recurret.* You may drive out Nature, but she'll be up and at you again! You may drive it out from your universities, and teach your lawmakers everything but the simplest natural truths that preside over the relation of man, body and mind, with the laws of the universe around him. They shall talk of Physics, and Metaphysics, and be ignorant of the most ordinary laws of both; and then they shall sit upon a Parliamentary Committee, and produce you such a struggling modicum of wisdom as this—

"The Committee concurs with some of the most experienced witnesses they have examined, in the opinion that the great majority of convicted prisoners are *open to the same good motives and good impulses that influence other human beings* (!), and therefore that a system of encouragement to good conduct and endeavour to inspire feelings of self-respect, self-reliance, and hopefulness, which have been tried in some of our largest establishments, ought to be adopted as far as practicable."*

Read this, shade of Howard! nearly three generations after you had wandered through the prisons of the earth and striven in vain to persuade mankind that the bird, though caged, was still a bird, that every 'old bird' was *once a young bird*, and that the bird that won't sing can be made to sing by early teaching, and can never be made to sing by mere punishment, which, indeed, never produced one song yet; and that "no song, *no supper*" is a good maxim all the world over, the prison world included. How the old birds grow from young birds, and how the young birds come to be old birds let the following extracts show.

"One plain fact showing the extent to which crime is caused by the neglect of children, is the large number of Orphans always to be found in prison. Out of *seventy boys and girls under eighteen years of age* in the prison, *fifty* had lost one or both parents; and the greater portion of the parents who were living were of bad character."†

And again:—

"Of children trained at all aright, the number is small indeed whom we have had the pain of seeing here: but where *any* pains have been bestowed even by one parent, the last thing forgotten in all the recklessness of profligacy is the prayer or hymn taught by a mother's lips; and the most poignant sting of conscience in solitude and adversity is what the memory of filial disobedience inflicts."‡

Are there no waste lands in Great Britain and Ireland where the busy fingers of inchoate crime may be reconciled to useful labour, and the brains belonging to those fingers be taught really to know, as a practical *truth*, that Honesty *is* the best policy? It is but to know that! Not to know it, is the ignorance that leads to all crime: and to rescue from crime 'one of the least of these' may indeed in a double sense of truth be called a charity that 'covereth a multitude of sins;' since, it has been ascertained that to cure one criminal is, on a proved average, to prevent fifty crimes. It is like 'killing a wasp in March,' which is said to 'take a whole nest without gunpowder.' And if there be an occupation that can turn *the wasp into a bee*, it is that first and best of arts that soils but not contaminates, that *separates*, but without solitude, that invites toil yet assuages and illudes it, that gives the help of a sound body towards the restoration of a sound mind; and the prolonged engagement in which, is consistent with and favourable to the exercise on the part of the supervisor, of the *three essentials of Reformatory Discipline* of the young offender, viz., KINDNESS, FIRMNESS, and HOPE. *H.*

* Resolution of House of Commons Committee on Prison Discipline, 1850.

† Mr. F. Hill. Report for 1845.

‡ Rev. Mr. Kingsmill, chaplain at Pentonville. 1846.

THE DUCHESS TRIBE OF SHORT-HORNS.

I FEAR that your correspondent Mr. Daly may still consider any information I have to communicate respecting the "Duchess" tribe somewhat scanty. Mr. Bates is dead, and breeders too seldom keep any written record of their proceedings, of the views on which they acted, of their successes or of their failures. This is greatly to be regretted, inasmuch as a history of their experience could scarcely fail to afford material assistance to their successors. With regard to the Duchess tribe, however, your correspondent has been misinformed when he has been told they were never first-prize takers at the national shows. At the first meeting of the Royal Agricultural Society at Oxford, the Duke of Northumberland (1940) took the first prize as the best bull of any age. Two Duchesses also took first prizes in their respective classes, and of five premiums awarded at Oxford, Mr. Bates carried off four! The Duke of Northumberland also took the prize as the best two-year-old and the best aged bull at the Yorkshire Society's meetings, when his dam also took the prize as the best cow. As far as short-horns are concerned, the exhibitions of this society rank quite as high as those of the Royal Agricultural, Yorkshire, Durham, and the North of England generally being the stronghold of the breed. It has happened before now, that a cow which has been the victress at the latter of these societies, has been beaten at the former in the course of the same season. Although not belonging to the Duchess tribe, it is not irrelevant to mention that 2d Cleveland Lad (3408) gained a second premium in 1843, and a first prize in 1844 at the Yorkshire Society's meetings, both because his blood was largely interchanged with that of the Duchesses, and as showing that public opinion supported the individual judgment of Mr. Bates in his choice of an animal, which, as you have yourself remarked, was almost without a pedigree. Again I remark that in the latter year, at the same society's show, Mr. Bell obtained the first prize for his bull calf General Sale, of which the sire was the Duke of Northumberland, and the dam was by Cleveland Lad; and that at the Royal Agricultural Society's meeting at Liverpool in 1841 a bull belonging to Mr. Bates also took the prize of 30 sovereigns. Latterly, Mr. Bates became indifferent about showing, as indeed who would not be after winning so many first prizes as he had done? Independently of the heart-burning, the jealousy, the expense, and the risk always incident to showing, the system, as at present carried out, involves permanent injury to the animals exhibited, because, in order to insure a fair chance of success, it is absolutely necessary to make them fatter than they ought to be for breeding purposes. Important as this point is, I have not space to consider it here, within the limits which I have assigned to myself, and I must therefore content myself with expressing my conviction that if the really useful qualities of short-horns are to be maintained, the present system of forcing them in order to win premiums must be altogether abandoned.

The facts which I have just adduced prove that, in the opinion of the judges at our agricultural shows, the animals of the Duchess tribe held a pre-eminent place. I now proceed to what I consider a still more decisive test of their merits, I mean the prices which the public have been willing to pay for them as breeding stock. The second Duke of Oxford (9046) was a son of the Duke of Northumberland, out of Cleveland Lad's sister. He was himself only second to his sire in appearance, and in his turn became the sire of many first-rate and high priced animals. Among the cows by him, I will only name Duchess 59th, which was sold at Lord Ducie's sale for 350 guineas, and Duchess 54th, which fetched the still higher price of 600 guineas. I desire to call especial attention to his son, fourth Duke of York, which at nearly eight years old, an age when numbers of excellent bulls are consigned to the butcher, made at Lord Ducie's sale 500 guineas. At Mr. Bates's sale that noble earl was by some persons deemed extravagant because he gave 200 guineas for him. Yet the event proved him triumphantly right, inasmuch as, independently of a numerous progeny of extraordinary excellence which he gained by his purchase, he more than doubled his original cost. Duchess 66th, which sold for 700 guineas, the highest price ever given for a cow, was in my opinion the most perfectly lovely short-horn ever seen. Along with her may be mentioned another daughter of the fourth Duke, Duchess 69th, which fetched the enormous price of 400 guineas, although only five months old. These sums far exceed those given at Charles Colling's sale, where the highest price given for a cow was for Lily, which fetched 410 guineas, while no heifer calf made more than 106 guineas. Here it may be interesting to note, that at the same sale the highest priced heifer was Young Duchess, the original of the tribe, for which Mr. Bates gave the large sum of 183 guineas, which was by his friends considered an act approaching to insanity. Yet, whenever the progeny of that heifer have come into the market, they have always been sold for prizes continually progressive up to the present day. I consider that the fourth Duke of York was the finest bull of our day, and that he was the sire of more stock of a superior and even quality than any other. He died on his passage to America last year. Many persons, however, considered that he was surpassed by another bull of the same tribe, the Duke of Glo'ster (11,382), which at the same sale fetched 650 guineas. However this may be, the world may safely be challenged to produce two other animals their equals, either for their interior merits or the evenly high quality of their stock.

These facts contain the reason why I consider Mr. Bates's herd superior to any other of our time. When did any other cows fetch such prices as these? What other herd can produce bulls like the Dukes of Northumberland, of Oxford, of York, and of Glo'ster? Nor must the sire of the latter, Grand Duke (10,284), be forgotten, which, apart from the excitement of public competition, was sold by private contract for 1000 guineas! The late Lord Spencer remarked that many defects were visible in a male animal which would not have been perceivable in an ox. To produce perfect males is therefore the highest test of the merits of any tribe, as it is the perfection of a male to impress his own character on his progeny. In this latter respect the bulls of Mr. Bates's descent are surpassed by no others.

Mr. Daly considers the Duchess tribe slightly deficient in the thighs and forequarters. A certain degree of lightness in the former part is the almost invariable characteristic of a cow that milks well, let the breed be what it may. On the contrary, whenever a cow has thighs like a bullock, there is the strongest presumption that she is no milker. That the Duchesses were noted in their early days for their milking powers, we learn from the pamphlet of the Rev. H. Berry. I know that they have not lost them now; and I have been assured, on the highest authority, that during the preparation of the Tortworth herd for sale, it was no easy matter to dry them, as was necessary, in order to put that "bloom" upon them which the public taste demands. For my own part, I much prefer a good milker to a cow with thighs like a fat bullock, but which is unable to rear its own calf. As to lightness of fore-quarters, that is a defect common, though not universal, among the highest bred short-horns. Many animals of the tribe we are considering are very good in that point, as the Duke of Glo'ster, for example. As far as my experience goes, it is possible by a judicious selection of parents to remedy this deficiency in the offspring. For instance, I have a cow whose sire was not of Mr. Bates's pure blood, while her dam and grand-dam were of his blood; she is herself excellent in the fore-quarters, a deep milker, and a very fine animal altogether. By a pure Bates bull she has had a prize heifer, and she is now in calf again to one of that tribe. I have another cow of the highest pedigree, being by 4th Duke of York (10,167) and of the finest quality, very lengthy and an excellent handler. It would be difficult for the most fastidious to find a fault in her, unless she might be thought somewhat light in the forequarter. She is in calf to the Duke of Glo'ster (11,382) whose depth there is extraordinary.

The prolific qualities of the Duchess tribe are at least equal to those of other short-horns. Thus it appears from the "Herd-book" that Duchess 51st produced six calves in seven years. That 28 females of the tribe should not have bred at all is so extraordinary a statement that I was led into inquiry as to its correctness; I find that of this number five or six heifers were choked at one time by eating too greedily of Turnip tops. Suppose an equal number to have died from natural causes, and that as many more were either fed for the butcher, or by being prepared for show were rendered prematurely fat, this materially reduces the number of those which would not breed, if indeed, which I cannot learn, that were the case with any. Mr. Bates, moreover, somewhat hasty in his proceedings, and having a large number to choose from, at once discarded a cow which showed any reluctance to breed. At Tortworth Duchess 55th had not had a calf at the time of the sale for three years, and having been for some time out of health, it was thought she might never have another. The consequence was that she only fetched 50 guineas, and that actually being in calf at the time, she was the best purchase made at that wonderful sale. *Willoughby Wood, Holly Bank, Burton-on-Trent.* [We understand that Duchess 55 has not had a calf since the Tortworth sale.]

OBSERVATIONS ON AGRICULTURAL STATISTICS.—By H. R. LACK.

(*Concluded from p.* 227.)

3. LAND CULTIVATED AND UNCULTIVATED.—One-half the area of Great Britain is stated to be occupied by farms. The hill pastures are not included in the farms to which they are attached.

The following are the proportions of territory occupied by farms in Great Britain, England and Wales, and Scotland, respectively:—

Great Britain	0.507
England and Wales	0.667
Scotland	0.209

Or one half of the territory of Great Britain, two-thirds of England and Wales, and one-fifth of Scotland.

The estimated number of acres under cultivation, as returned by the farmers, in Great Britain in 1851 was 29,213,312, and the number uncultivated or unaccounted for 28,411,065.

The table below (No. 3) shows the proportion of cultivated and uncultivated land in each division of Great Britain, in the year 1851:—

TABLE III.

DIVISIONS.	Estimated No. of acres under cultivation as returned by farmers.	No. of acres uncultivated or unaccounted for.	Total acres of territory.
England and Wales	24,905,758	12,419,157	37,324,915
Scotland	4,188,578	15,858,884	20,047,462
Islands in the British Seas	118,976	133,024	252,000
Great Britain	29,213,312	28,411,065	57,624,377

Note.—In addition to the number of acres farmed in Scotland there were 1,662,491 acres of pasture or moor land, making in all a total of 5,851,069 acres under cultivation of some kind in Scotland in 1851. A considerable addition may also be made to the number of acres farmed in England and Wales, on the assumption that many of the farmers did not return the acreage of pasture or moor land held by them in addition to the number of acres actually farmed.

In the year 1827 the amount of land under cultivation in Great Britain was estimated to be 34,397,690 acres, and that uncultivated and waste 23,554,799 acres, making a total of 57,952,489 acres. This estimate is in excess of the recent returns made by the farmers to the census office, and appears to be rather a high one. Taking the better means possessed by the census commissioners for obtaining information on this point into consideration, there is no doubt that the returns for 1851 are the most correct.

4. LABOURERS ON FARMS.—The number of labourers on farms, males and females, in the year 1851, was as follows:—

OCCUPATIONS.	MALES. Above 20 years of age.	MALES. Under 20 years of age.	FEMALES. Above 20 years of age.	FEMALES. Under 20 years of age.
Out-door agricultural labourers, including shepherds	824,587	201,216	56,073	14,826
In-door farm servants	109,452	126,491	63,538	64,713
Occupied in the woods as woodmen, &c.	8,896	1,174	18	

Total { Males, ... 1,271,816
{ Females 199,168

Of the total number of farmers returned to the census commissioners in 1851, 128,096 were stated as employing no labourers, and it may therefore be supposed that they were small farmers who did the manual

labour themselves, assisted by their children and by the employment of occasional labour.

The number of farmers in Great Britain in 1851 who only employed one labourer each, was 38,821; those employing two 33,536; three, 21,172; ten, 9660; twenty, 3153; forty, 403; fifty, 213; and those employing sixty labourers and upwards, 182. These returns are exclusive of women and children.

It needs also be stated that of the total number of persons who returned themselves as farmers, no less than 22,982 were engaged in some other pursuit or business besides that of farming, and amongst this number we find 3434 inn or beershop keepers, 1885 millers, 1463 nurserymen, 1230 land proprietors, and 1352 butchers. The remainder of these persons were engaged in various other occupations.

From the foregoing statements it will be observed that it is very difficult to arrive at any satisfactory results with regard to the exact number of farm labourers employed. The only way in which we can get a tolerably fair view of the proportion of the population engaged in agriculture is to view the whole number of persons employed in agricultural occupations as a class; and as a class compare them with the total population. On doing this we find that 26 per cent. of the males, and 3 per cent. of the females, of 20 years of age and upwards—and 8 per cent. of the males and nearly 3 per cent. of the females under 20 years of age, were specially employed in agriculture in the year 1851.

From what has been said, it appears that the agricultural classes have increased in number since 1831 but decreased as compared with the increased population, that is to say that although the total number of persons employed in agriculture has somewhat increased since 1831, it has not increased in the same proportion as the population.

The agricultural classes of Great Britain, therefore, as regards number, may be stated to occupy a nearly stationary position; the efforts of the farmers being rather directed towards the greater production of the land under cultivation than to the inclosure of uncultivated lands.

In the United States of America not only are the farmers paying greater attention to the fertilisation of the lands already under cultivation, but the stationary position of the agricultural classes in that country is also apparent, although not arising from precisely the same causes as in England. In the Patent Office Reports on Agriculture for 1849 it is stated, with reference to that country, "That it is a notorious fact that farm labourers do not seem to increase; they are everywhere scarce, and the demand for their labour in the towns and manufacturing villages enables them to command high wages.. . . . Farmers can with difficulty obtain sufficient labouring men, notwithstanding the almost half million of arrivals" (immigrants).

It is very probable that the increased education of the working classes may have in some measure been the cause of this scarcity of labourers, and if so, the still increasing education of the masses will materially affect the position of the farmer. For it is evident that when the masses become more generally educated, they will be better able to undertake skilled employments, and therefore the farmer will have to raise the wages of his labourers; for if he does not, he cannot expect a man to be content to do the work and receive the pay of unskilled labour, when he has the means in his power of acting just in the opposite direction.

The introduction of machinery, however, in the place of unskilled labour, will enable the farmer to get over this difficulty; and to raise the wages of the skilled hands he will then require to employ (which will be fewer in number than those at present engaged) to the standard of that of the manufacturing labourer, and thus the skilled agricultural labourer will be placed on an equal footing with the skilled manufacturing labourer. When farming is managed entirely upon scientific principles it will be necessary for the farm labourer to know something of those principles, and so we may hope that the position of the agricultural labourer will eventually be greatly improved.

With regard to the territory which is lying waste it is possible that science may aid us in reclaiming a portion of it, and when we consider the wants of the coming generations it appears most necessary that every step should be taken to increase the fertility of the soil, as well as to restore waste lands to fruitfulness. It is worthy of notice that some thousands of acres of land in this kingdom, hitherto employed for agricultural purposes have, during the last few years, been used for the construction of railroads, and thus been subtracted from the total producing area of the country. To make up this deficiency, as well as to provide for the increasing wants of the people of this land, is in the power of the agricultural classes, and it is hoped that they will, ere long, awaken to a sense of their own and country's interest.

HOW ARE WE TO FIND FOOD FOR OUR FLOCKS?

Of all the inquiries which press most anxiously upon the farmer's consideration at the present moment, this is the most urgent and obtrusive. In an unparalleled season like this, when our soft Turnips, on which we depended for our ewes and lambs, are almost universally destroyed, and when the extreme backwardness of the season is considered, in which Nature seems unable or unwilling to awake from her long wintry sleep, or the sharp nightly frosts, like fetters of iron, bind her hand and foot, and either prevent her putting forth her powers or counteract her efforts, it seems that nothing short of a miracle can find food for the enormous number of animals, now all at once starting into existence, and clamouring for that supply which she has so unprecedentedly withheld. What is to be done?

An answer to this question will, perhaps, be one which will interest your farming readers more than any other, perhaps not less than the taking of Sebastopol itself—and to this question I now apply myself. The first grand requirement in the feeding of ewes is, not only that they should have a sufficiency of food, but that that food should be succulent in its nature, and capable of enabling them to secrete a sufficient quantity of milk for their lambs.

The second grand requirement in feeding of ewes and lambs is, to do it so economically, that while they get the benefit, the farmer does not suffer in his pocket beyond what he may reasonably replace. Now I asked a large flock-master the other day how he fed his ewes, and what he thought the best food for bringing them to their milk. "I give them Oats," he said; "nothing like Oats." What I said to him was this: "You remind me very much of an old joke against a brewer, who upon a friend bragging to him what excellent beer he brewed, asked him how he made it, 'Why,' said he, 'I procure the best malt and Hops.' 'Ah,' said the brewer, interrupting him, 'any fool may brew good beer with good malt and Hops; but the grand art and mystery of brewing is to brew good beer without either.' So I say, any one may keep up the condition of his ewes, and get up his lambs, with plenty of Oats, but to do it without,—'There's the rub.'" Now, it is a fact well known in animal physiology that highly nutritious food, in a concentrated state, does not produce the same beneficial effects upon an animal fed with it, as food less nutritious but more bulky; bulk is essential to bringing the mechanical action of the stomach into play, and, though a pint of Oats is essentially more nutritious than half a pint of Oats mixed with half a peck of chaff, yet the latter would be more beneficial than the former, because of its mechanical effect. And this brings me to the question of the economical feeding of ewes and lambs; and the substance which I point to, is straw. "Straw," some one will say, "I should like my ewes to eat straw." Straw this season is the farmer's sheet-anchor. Thanks to a bountiful Providence, if we have no Turnips, we have plenty of straw. Of straw, as a light-land farmer, I would say, as the poet of "The Seasons" beautifully said of health: "He that hath thee hath little else to wish for; he that is so wretched as to want thee wants everything with thee." I remember visiting a successful Norfolk farmer many years ago, one who by his farming had lined his pockets well; I found him in his chaff-house, standing beside a large heap of straw chaff, and seeing it prepared for some operation. I asked him what he was going to do with it. "Stay a minute," said he, "and I will show you." Presently a man came in with two pails full of hot boiling Linseed mucilage, and emptied them amongst the chaff, which act he repeated, and then mixed straw chaff and mucilage all up together. "There," said my friend, "that's what I do with my straw; and if those who grow the wretched stuff called 'low-land hay' knew how worthless it is, they would never be at the trouble of saving it, while they can get good straw. I feed all my horses and bullocks upon straw chaff." I was a younger man then than I am now, yet I have never forgotten the lesson which I then learned; but I fancy I have rather improved upon my friend's practice, for instead of giving it to my horses and bullocks only, I give it also to my ewes and to my fatting sheep.

We have all laughed at the old joke of the two penitents, who being enjoined penance to a distant shrine, were to proceed there with Peas in their shoes. One performed his journey gaily and expeditiously, and returning home, met his poor foot-worn crippled brother hobbling along, having hardly made any way at all, who asked how it was that, enjoined as they were a like penance, the other should have got over his ground so gaily and so quickly, whereas he was in torture, and had all his misery yet before him. "Well, to tell you the truth," said the more sly and fortunate brother, "I took the liberty to boil my Peas." And here's the secret of using straw chaff—cook it; you will never get sheep to eat it successfully without, unless a portion of pulped root is mixed with it. I steam mine. To do this I have brick vats, which will hold about 500 bushels, with perforated false bottoms; beneath these false bottoms is the steam supply pipe, which I can regulate at pleasure, but where there is not a supply of steam a substitute may be found in this way: take any large receptacle—it may be a mash tun, or anything else, the larger the better; place within it a layer of straw chaff, about 4 inches thick, sprinkle this well with boiling water, put in another layer of chaff, sprinkle this in like manner, and so on, until your vessel or receptacle is full; press it down tolerably compact, cover it well up, and let it stand until the straw is thoroughly cooked. I find it best to mix a small quantity of good stover or hay chaff with the straw chaff before steaming—say one-sixth part or one-fourth part, if you have plenty; it gives its flavour to the straw, and makes it very palatable; and I also add just a little dust of salt to flavour it; and those who are fortunate enough to have some Swedes or Mangold left will do well, with the aid of my pulping machine, to pulp a few, and mix with the chaff after it is cooked sufficiently, when they will find, to their great satisfaction, and that of their animals, that they have prepared an economical and nutritious food, which their ewes will eat with a relish, and that as often as they please to repeat it.

I will venture to say that whoever will adopt this plan systematically will find that he has got hold of a recipe which, if it does not make his fortune, will at any rate save his animals from starvation, and his pocket from a ruinous outlay.

At the present moment I am feeding nearly a hundred score of ewes and lambs and other sheep by this mode, without having scarcely a sound Turnip left upon my farm, and without the assistance of corn, meal, or cake; and I never had my ewes and lambs do better in all my experience. *Frederick Phillips, the Hall Farm, near Brandon, March 20, in the Bury and Norwich Post of March 28.*

Home Correspondence.

Agriculture as a Science.—The difficulties which a good practical farmer has to encounter are many and perplexing. There is one, however, that stands paramount above all others, as claiming the first attention—it consists in a general ignorance of the qualities and temperament of the staple soil. True it is that cultivation has made great advances during this 19th century; and indeed since the time when Arthur Young, in 1770, wrote in favour of bones as beneficial to clay lands, and when Marshall, in 1795, asserted that one farmer in Norfolk had applied rape-cake for 20 years at the rate of 1 ton to 3 acres, which cost from 2*l.* to 3*l.* per acre. Artificial manures were, however, little thought of till the organic manure produced upon the farm was found to be insufficient to recruit a soil exhausted by inadequate tillage and injudicious cropping. Judging from the many statements and opinions recorded in our numerous periodicals, and the facts we obtain from personal inspection, we arrive at the conclusion that agriculture still remains, to a great extent, under the guidance of empirical routine, and that little is really known of causes or principles. The discordant and even opposite results obtained from the use of any kind of fertiliser upon different portions of one and the same farm or garden yield proofs conclusive of the existing ignorance of the first principle above alluded to; and therefore until the mineral elements of the soil and subsoil be thoroughly understood, any system of agriculture must be more or less defective and uncertain in its results. But how is such knowledge to be obtained! If the plain and direct answer—"By analysis of the soil" be returned, then the immensity of the undertaking must render the attempt all but hopeless! Here, however, it is but just to inform the English reader that the Highland Society now offers, at its own expense, to have correct analyses made of the soils and manures used by those farmers who may compete for its premiums with special manures. Aided by the steady and rapid advance of chemical science, with the most delicate tests and refined processes, much might be locally effected during that deep laboration of land which must precede the thorough draining of every good farm, and wherein the temper and constituent minerals would, to a great extent, be discovered, and the required system of manuring indicated. Since the first appearance of Liebig's work the mineral constituents of the ground have been much studied, and less has been thought of stable and fold manures. Those elements are sandy or silicious matter, alumina or the basis of pure clay, chalk (carbonate of lime), and oxide of iron. These minerals are found in extremely variable quantities in every fertile land, and of that I had ample means of proof during my 17 years' experience in Berkshire. I first consulted Sir H. Davy, and went through the minute details given in the 12 pages, commencing at p. 140, of his fourth agricultural lecture. Clever as these were nearly 50 years ago, they (and also the processes of the late Dr. Henry) failed to bring out clear results, particularly in the elimination of the oxides of iron and phosphoric acid. The simple and mechanical washing through tin strains perforated so as to arrest silicious particles, and carry off the soft and more divisible fine matters, proved more instructive in so far as that they at once exhibited the substances which constitute the texture of the sample. Step by step improvement advanced; and about the era when the English Agricultural Society was established, every process of refined investigation was rendered more conclusive by the writings of Dr. Ure and Fownes, and in Mr. Mitchell's "Analytical Chemistry." The young chemist can now feel his way to discovery by the light so afforded. My experiments upon land and its soils, by deep 3-spit trenching, proved the necessity of effectual turning over, trituration, aeration, and comminution of all new lands, and also the good effects that would follow a similar course in the renovation of old ground long under the cultivation of its upper stratum to the depth of 6 to 8 inches only. If we desire to manure on sound principles with auxiliary fertilisers appropriate to the requirements of the earth, we must, as before stated, acquaint ourselves with the actual condition of every rod or pole and rood of land prior to the introduction of any particular crop. The subject of organic manure, such as those of the dung-heap and of Linseed cake, requires great attention, and that for a particular reason, little noticed by any writers. Lime, also, has its own essential specific claim not to be passed by or overlooked; but space cannot now be afforded, though the objects are of great interest. *J. T., Croydon, April 3.*

Newton-Abbot Union.—Report of the Agricultural Committee for the year ended Christmas, 1854.—The

agricultural committee beg to present to the board their annual report and balance-sheet for the past year. In so doing they think it unnecessary to enlarge on the advantages of the labour scheme, as carried out in this Union during the last four years, or upon the beneficial results which must be admitted to have followed it. In preparing their balance-sheet they have made use of the form adopted by them last year. They consider this form will convey, in the most concise manner, all the information which may be required as to the quantity of the different crops grown, and their disposal, as well as a fair statement of the pecuniary results of the year's proceedings. The total quantity of land under cultivation is about 6 acres; and the following is a statement of the amount of the principal crops grown thereon during the past year:—Potatoes, 241 bags (not including refuse given to pigs); Wheat, 13 bags; Barley, 20 bags; Cabbages, 28 cwt.; Swedes, 10 cwt.; Parsnips, 26 cwt.; Mangold Wurzel, 6 tons; Onions, 340 lbs.; Leeks, 1000 lbs.; Broccoli, 8 cwt. The number of hours of labour, &c., performed during the past year by the different classes of inmates employed on the land, has been as follows:—The aggregate number of hours of field labour done by adult paupers (mostly aged and infirm), 12,983½; the number of adult paupers at work on an average of 8½ hours daily, 5; the total number of hours of field labour done by boys, 14,218; the number of boys at work, five days each week, and on an average 4½ hours daily, 13; the number of boys in the house fit for service at Christmas was 8. By a comparison of these figures with those on the last year's report, it will be seen that there is an increase in the number of boys whose labour has been made available during the last year. Nineteen boys were provided with situations in the course of the year. The committee cannot conclude their report without adverting to the loss which they, as well as the board, have sustained by the death of their late chairman, Mr. Story, whose deep interest in the success of the agricultural scheme, and the zeal and energy displayed by him in promoting that success, are well known to every member of the board. *E. S. Bearne, Chairman, March 7.*

Loss of Sheep by browsing Yew.—On the night of Jan. 17th a flock of sheep got into the gardens of Gosfield Hall, and fed on the Yew trees growing in abundance there. In the morning the owner was sent for, and in a note to me he says—"I found two dead, and the remainder, or at least the greater portion of them, unable to walk, foaming at the mouth, and in a stupid state." The number was 63, out of which 42 died. From the fact of the ground being covered with snow, I suppose the sheep were very hungry, and ate voraciously, hence the fatal result. The treatment adopted had no effect. Considering the nature of the poison a "narcotic irritant," I believe that oil, of whatever kind came first to hand, would be the best remedy, acting as a purgative of a mild kind, and sheathing the intestines from the irritating effect of the Yew. The oil should be repeated at intervals and gruel also. Some of the sheep lived several days, and one 10 days; but touched nothing but what was forced down as a drench. It was a sad sight to see the poor things standing for hours in the same place and position. In the last that died the intestines were almost in a rotten state from the intense inflammation. *T. T.*

Societies.

ROYAL DUBLIN SPRING SHOW, *April* 10.—This Society, the patron and parent of all the other various societies for the improvement of the agriculture of Ireland, is now holding its annual spring exhibition of farm stock, farm implements, and to some extent farm produce, and never during the 30 years in which I am acquainted with its exhibitions, scarcely one of which during that time have I missed the pleasure of seeing, have I seen one which told so well as this is likely to tell for the real improvement of Irish agriculture, in as far as the production of improved stock and of improved implements are concerned. At this early stage of the exhibition it would be premature to give anything like a full description of the various animals or various implements in anything like detailed accuracy, for at the moment I write the judges are only entering on their arduous task, nor would I so soon give you this brief notice, but because at a later period it might be too late for your next publication. Indeed, but for the obliging disposition of the Curator I could not give you as much information even as I now do, as the catalogues are very properly kept out of sight till the judges have made their awards.

SHORT-HORNED STOCK muster in large numbers, and are quite select in character.

Boars, not exceeding 24 months old	24
Sows in pig, or had littered during the last six months ...	18
Breeding Pigs in lots of three; 14 entries	42
Litters not exceeding 4 months old; 13 entries, probable average of 8	104
Total number of black Pigs	188

SWINE—WHITE PIGS.

Boars not exceeding 24 months old	10
Sows with litters or in pig...	10
Breeding Pigs of three in number; 2 entries	6
Litters not over 4 months old; 7 entries, average 8	56
Total of white breeding Pigs	72
Fat Pigs of any breed	6

The Royal Dublin Society, with much good judgment, separated the whites from the black breeds on this occasion, and it is to be hoped, if the funds admit, they will, by the next show, separate the large from the smaller breeds in both the classes. Having run this analysis, I fear, over long, I will merely add I had a hasty look through the above stock yesterday evening, and hence the impressions glanced over in the introductory part of this. The poultry I had not time to see. Of course the horses I could not see, as they will be only on view during the week. The implements as well as the farm produce are select and valuable, which, with the poultry and horses, as well as the stock generally, deserve a more detailed notice. *Edward Carroll, Triton Villa, Phibsboro, Dublin, April* 10.

Farmers' Clubs.

LONDON: [The following remarks followed the reading of Mr. Bennett's paper last week on Root Crops]:—

Mr. RUSTON observed, that he happened to be one of those unfortunate men who farmed fen land, and he assured them that they were entitled to all the sympathy they could obtain. In their cultivation of that description of land, however, they hardly needed the caution which Mr. Bennett had given regarding a thorough pulverising of the clods; for their real difficulty was not how to pulverise but how to compress and consolidate, so as to prevent dry winds blowing away the soil; hence the growing of roots on this sort of land upon the ridge system did not succeed so well as upon the flat, for the influence of sun and wind so dried up the land that the seed no sooner became a plant than it dried off. During the last spring he sowed eight acres of Mangold—four on the flat and four on the ridge system—fresh ploughing and manuring the whole. The four acres cultivated on the flat system did extremely well, but the four cultivated on the ridge, after vegetating, immediately died away, which compelled him to follow with a crop of Swedes. He had been most successful on light soils by manuring in winter, just before Christmas, ploughing the manure well in, and letting it lie till the spring, then working the land two or three times, so as to thoroughly incorporate the manure with the soil, and consolidating it with Crosskill's roller. He had derived considerable advantage from the use of the liquid manure drill, and believed that Mr. Bennett had some of his Mangold in his eye when he mentioned the benefits he had witnessed from the application of the water drill in the fen districts. Last year he used it to a considerable extent, when it answered so admirably that he invited Mr. Bennett down to see for himself the difference between the dry and the water drill, where all things were equal. A cousin of his had also made an experiment with the two sorts of drills on a piece of Swedes, but he did not know the dates of the sowing and weighing. The produce per acre on the land sown by the water drill was 16 tons 10 cwt.: on that sown by the dry drill, 12 tons 7 cwt. 4st.; being an excess in favour of the water drill of 4 tons 2 cwt. 4st., the manure used being in the proportion of 2 cwt. of Lawes' superphosphate of lime, and 10 loads of yard manure per acre. In his own experiments the produce resulting from the liquid manure drill was about one-fourth more than that from the dry drill; but he was convinced that the water drill would not be equally effective on all soils, though generally where there was a difficulty in getting the seed to germinate and the plant to grow well in the early stages of its existence, which was the case in his district, it would produce satisfactory results; indeed he had never experienced a failure. However his experience had led him to the conclusion that fen land was unsuitable for Turnips, and he intended never to sow them on such land again.

Mr. J. WILLIAMS (Wilts) said that after nearly 30 years

experience in the growth of Turnips, during which period he had tried almost every plan in existence, he had arrived at the conclusion that the best system for general adoption was that described by Mr. Bennett. With regard to the relative merits of the flat system of drilling, he could state that it was considered the best in the West of England; and the old system of sowing Turnips without manure was nearly obsolete.

Mr. Wood (Sussex) remarked that he farmed that description of soil which Mr. Bennett considered it hardly expedient to cultivate Turnips upon to any extent—he meant a stiff clay soil; perhaps it might be unprofitable to do so merely for the sake of root crops, but taking it altogether, and considering the cleansing it gave the land, it answered his purpose to cultivate it in that way. He believed the autumn was the best season for that purpose. As to ploughing the land deeply, he coincided with Mr. Bennett that it increased the value of the soil. His (Mr. Wood's) system was to plough gradually deeper and deeper, and subsoil afterwards. He had not yet tried the liquid manure system, but he should like to know whether by that system the seed would not in some cases malt or sprout, without taking root, and then die from the drought around. He always ploughed on the flat, and not on the ridge; for he never drilled in his seed till after the land had been worked down for a considerable time, so as to have the moisture near the top and in contact with the seed. He considered the most economical mode of cultivating roots depended much on the nature of the soil, and that whatever the plan adopted it should be in the autumn.

Mr. Charles Howard said, that he had taken great interest in the cultivation of Turnips. His farm was a really sharp gravel, notwithstanding Mr. Bennett's thinking the contrary. In fact it had always been considered a burning soil. When he first entered on it he used to plough in the regular way, 4 or 5 inches, deeming it sufficient to get the land up before Christmas. For some time he pursued that jog-trot system; but after reading a good deal of what passed in that Club, he put a stop to it, and commenced the system of autumnal cultivation. He had been very successful; and he considered that success depended upon the following course of operation—autumnal cultivation, deep winter ploughing, wide intervals, early sowing, and choice of seed, all of which important matters ought to be kept in view in cultivating Turnips. He used to sow his Turnips in June, latterly he had commenced in May. He had tried Chandler's drill, but without the beneficial results he had anticipated; probably that was through his inexperience in its management. He intended trying again this year. For some years he had experimented in the cultivation of Turnips, both on the flat and on the ridge system, and had found that a greater weight was to be grown on the ridge, with much less manure, because the manure was immediately under the Turnip. By having them at wider intervals the land could be better watered; the most they could do on the flat was to hoe once or twice, on the ridge they might hoe three or four times.

Mr. Ruston remarked that his Turnips were sown about 26 or 27 inches apart on the flat, the same as on the ridge.

Mr. Thomas, after stating that he had been a large and successful grower of Turnips, said that five or six-and-twenty years ago he happened to be in the neighbourhood of Worksop, Nottinghamshire, when he was impressed with the extraordinary quality of the Turnips grown there, the cleanliness of the soil, and the success which invariably attended the farmers in the production of the roots. On inquiry he found that their almost uniform plan was to apply the farmyard dung made in the previous year to the Clover leas before the sowing of Wheat, and that the Turnips were grown by the application of bone-dust to the ridge. He tried this system himself, and had better crops than he ever had by any other plan.

Mr. Little (Wilts) said it appeared to him that on two points they all seemed to agree—autumnal cultivation and clean cultivation. With respect to Chandler's liquid-manure drill, he could say that it had accomplished great good in his county, and was an immense boon to the light-land farmer; in fact, it had reduced to a certainty the culture of the Turnip upon that description of soil. On the large farms in Wiltshire the ridge system was seldom adopted; the Turnips were drilled on the flat, and the artificial manure, generally applied by means of Chandler's drill, was superphosphate with a little guano. With regard to the seed malting, he had never seen it on light soils. He had never lost a plant from the use of the water drill, but from the dry drill he had lost many.

Mr. Owen (Berkshire) considered that the application of sufficient cart dung to the Wheat crop was the ground-work of the root crop the following year. He thought that artificial manures were the cheapest manures that could be put upon the land for Turnips. Having been one of the first to use Mr. Chandler's drill, he could speak with the utmost satisfaction of its value; and if had the necessary supply of water on his farm he would not put in Turnips under any other system.

Mr. Chandler (inventor of the drill bearing his name) said he knew of but two cases where his drill had failed, and one of them was Mr. Howard's. He was unacquainted with the nature of that gentleman's land, but he (Mr. Howard) had described it as a sharp gravel or building sand; as superphosphate contained a good deal of lime, it was not improbable that the building sand and the superphosphate had combined to form a concrete. (Hear, hear.) The other case was in Shropshire; in that case the drill was to have another trial. It was of no use to try the liquid manure system unless by some compression they made the land retain the moisture put upon it.

Mr. Abbott (Norfolk) observed that Mr. Bennett's system was the same as that generally used in Norfolk. He did not agree with the plan of ploughing only once in the spring; it was highly desirable to plough the land three times.

Mr. Wood.—Would it not be better to go a little deeper at first?

Mr. Abbott.—My soil will not admit of deep ploughing.

Mr. Howard.—How deep do you plough?

Mr. Abbott.—Seven or eight inches.

Mr. Bennett observed that there seemed but one point on which the meeting did not agree—whether the ridge or flat system was the best. After 30 years' experience he had arrived at the conclusion that he could grow 5 or 6 tons more per acre by the ridge than by the flat system.

The following resolution was then unanimously adopted:—

"That it is the opinion of this Club, that in the cultivation of root crops the principal points to be borne in mind, having regard to the most economical mode of proceeding, with a view to a full crop, are—autumn cultivation, deep ploughing, where practicable, choice of seed, judicious manuring, and seasonable hoeing."

The thanks of the meeting were unanimously given to the lecturer and to the chairman.

Miscellaneous.

Will Cattle pay for their Keep?—The real value of a crop of roots can only be fixed by the amount of beef or mutton which a given weight will produce. Some have assigned 150 lbs. as the quantity required to produce 1 lb. of beef; this is too high an estimate of their properties. 200 lbs. is nearer the mark in an average of crops and seasons. Taking the price of beef at 6*d*. per lb., a ton of roots will have a money value of about 5*s*. 7¼*d*.;—the feeding value of roots, therefore, may be reckoned at 6*s*. per ton in order to simplify calculations. Experience has led me to fix 5 lbs. oilcake as the maximum daily average which a bullock of 60 imperial stones when fat should receive during the time of fattening, and for a sheep of 20 lbs. per quarter when fat ½ lb. is the highest daily average allowance for which a return of prime cost has been made on this farm. With these quantities, and valuing the roots at 6*s*. per ton, or 5*l*. an acre, I have not had any difficulty in making both cattle and sheep pay for what they consume, and leave a money profit, and the manure into the bargain. Hay is never given to cattle except under peculiar circumstances, as sickness, or along with cut Grass in summer, when it acts very beneficially, especially when soiling in wet weather. The quantity of roots given daily to a bullock of the size named is three baskets of 50 lbs. each, along with straw *ad libitum*. 5*l*. an acre may not be thought a high enough value for a crop of roots, but we must remember 17 tons is a good average crop in ordinary seasons, and considerably above the present; indeed I have not known a valuation wherein this amount has been reached on farms of any extent under ordinary cultivation. Whether they can really be grown for this sum depends on a variety of circumstances into which I shall not at present enter, but will subjoin a statement of the result of fattening 20 oxen during part of 1853 and 1854.

Food and Produce of Dairy Cows.—The following experiments, conducted with great care, on the different kinds of food usually given to cows, will be found interesting and valuable. The cows were house-fed summer and winter, and had access to a pasture field for four hours daily; in addition to the food mentioned in each experiment, they received Oat-straw, the refuse of which was used for litter. The milk was measured every morning and evening, skimmed after setting 36 hours, and churned generally in one hour at a temperature of 60°.

No. of Experiment.	No. of Cows.	Date at which Experiment was finished.	Kind and quantity of feeding per head daily.	Duration of Experiment. Days	Produce. Gallons of Milk.	Quarts of Cream.	lbs. of Butter.	No. of Quarts of Milk to produce 1 quart of cream.	No. of Quarts of Cream to produce 1 lb. of Butter.	No. of Quarts of Milk to produce 1 lb. of Butter.
1	7	April 11	70 lbs. of Mangold and 50 lbs. of Turnips	9	42¾	28	19	7·43	1.21	9
2	12	July 11	Italian Rye-grass, *ad libitum*	7	173	115	75	6·01	1·53	9·22
3	12	Sept. 18	Second Cutting of Clover	7	181	88	60	5·95	1·46	8.73
4	12	Sept. 25	Cabbages	7	144	92	62	6·26	1.48	9·29
5	12	Oct. 2	Mangold Leaves and Cabbages	7	169	94	60	6·89	1·56	10·8
6	12	Oct. 9	Mangold Leaves alone ...	7	212	137	86	6.67	1·47	9·86
7	12	Dec. 1	50 lbs. of Mangold and 60 lbs. of Turnips ...	7	168	93	74	7·22	1·25	9·08

These experiments not being so comprehensive as would be desirable, they shall be repeated next season. The Grass, Clover, Cabbage, and Mangold leaves were not weighed, but they were given in such quantity as would not disturb the animal system. The influence of a change of food was immediately perceived in an increase of milk; and the effects of the food of the previous week did not extend to the succeeding week, so as to have any influence over the experiment. In reference to the case in which the cows received Mangold leaves and Cabbages, and in which there is an increase of milk above the previous week, but a less quantity of butter; it is right to observe that the cows did not seem to relish the Cabbages after the Mangold leaves, a fact which partly accounts for the result. *From Magazine of Albert Training Institution.*

Calendar of Operations.

APRIL.

Berwickshire Merse Farm, *April* 9.—Five weeks ago I reported that the storm had come to an end; but scarcely had we begun to think of seed time when the wind returned to the east, and we were for a fortnight exposed to all the horrors of a second and unseasonable storm. A constant succession of snow showers whitened the ground every night; but the temperature was never much below the freezing point, and sometimes rose of an afternoon so as to melt the nightly fall, which on one occasion reached the depth of 7 or 8 inches. In these brief intervals lea ploughing was proceeded with; some, indeed, eager to get on, ploughed down the snow, which will make but a cold bed for their seed. On the 23d ult. the snow finally left the fields clear; and, cold east winds still prevailing, a dry seed bed was quickly prepared, and Oat sowing has been universal during these two weeks past. Lea harrows beautifully; but Turnip land, where wet tramped with sheep, has got hardened by the drought, and does not present to the Barley seed so fine a mould as that cereal is said to require. We never had a right fresh, however, until Thursday last, when the wind veered to the west. It has since that day blown pretty strong, revealing black ground on the hills, and dissipating those patches of snow that lingered so pertinaceously in sheltered nooks. Seed time will be all but over this week. It has been characterised by dry winds, like last year; but after a late spring a dry summer would be doubly hazardous. The wind has risen very high this afternoon, and we hope for rain; indeed at this moment a smart shower is passing over us, but it will be dried up in ten minutes. The young Wheat plant was well protected from the severe frosts of February, but after the departure of its snowy covering, it looked very blue under the influence of the frosty east wind. These two or three days, however, have given it a healthier colour; and, of course, but few plants have been thrown out by frost. Grass is at least a month back; but the plant is good, and has just begun to grow. Ewes have, since lambing, got 2 or 3 lbs. each of Oats a day (besides Turnips) to promote the secretion of milk, but this has proved terribly costly latterly, and a portion of Rape cake has been substituted. As a consequence of the dry weather the lambing progresses but slowly, but the crop promises to be an average one. Lambs lived wonderfully well during last storm; but those lambed earlier, which with better weather might now have been fat, will scarcely regain their lost time, and many of them must be kept on as hogs. Turnips are now very scarce, but scarcely so dear as they were, for folks will rather have Grass at a high price at this season than doubtfully nutritious Turnips. Consequently Grass parks have been let, in many cases, above last year's very high rents. As irrigation is not practised in this district, we cannot expect to cut seeds for soiling before the month of June, though they were top-dressed with Peruvian guano in January, and will soon receive a further allowance of nitrate of soda. *J. T.*

Border of the Fens, *April* 10.—The weather may well be a prominent a subject of conversation, since the health of every individual depends so much upon it, and the prospect of having plenty to eat next year is confirmed or uncertain according as the effects of long continued frost, the prevalence of harsh winds or any other cause retarding the spring, brings evidence of mischief to the future crop, or discovers there is slight grounds for alarm to the ever sensitive and observant farmer. Two or three mild days and a few passing showers have started into growth both Grass and Wheat, and we again behold a healthy green overspread the fields: Oats and Barley are making their appearance, and the Beans look strong, yet there is good reason to fear that a good deal of Wheat will be too thin of plant, particularly on cold or thin soils, and after Clover. In the fens those crops of Wheat that succeed Oats are observed to suffer most, but in nearly every case after Beans, Coleseed, Carrots, or Turnips, the Wheat looks strong and of a good colour. If the dry cutting winds are unfavourable to the pastures, they suit planting Potatoes well, and a great breadth will be got in this week. I saw yesterday a rather uncommon plan of putting Potatoes in by drawing the trenches with a plough first, then spreading manure out of a cart into the trenches, placing the Potatoes *on* the manure and raking the ridges over them so as to level the surface: I remarked that the practice seemed a good one, except placing the Potatoes *on* the manure, which I contend ought to have been ploughed-in previous to trenching the land, or if placed in the trenches they should have been split in a somewhat similar manner to ridging for Mangolds, only a little more care would be required in dropping or rather pressing the Potatoes in at a proper distance and depth. After Potatoes are disposed of we must attend to Carrots and Mangolds; we give a good dressing of farm-yard manure to the seed-bed of the Carrots, and although we have been cautioned to expect thereby forked roots and coarse ungainly produce, we have more than once or twice had a heavy crop of straight and clean Carrots; as to Mangold, we shall sow as early as we can, probably next week, although we may have a few plants run to seed we deem that infinitely preferable to a deficient or late plant, for transplanting will never come up to the Mangold grown where they are sown. The lambing season is nearly concluded, and we hear generally of a good fall of lambs this year; some persons have already stocked their seeds with ewes and lambs, but this should be done as lightly as possible before May-day, as this year neither Clover or Rye-grass have made much progress, and they appear to suffer much from wind and frost when prematurely stocked. Applications for work are numerous, but in another week or so hoeing will require all the labourers now unemployed. *J. W., Peterborough.*

Wester Ross, 10*th April*.—The weather continues particularly unfavourable—stormy and changeable. Last month we had a few fine drying days, which were taken advantage of for getting down the remainder of the Wheat, and for sowing Oats. On the earlier farms in the neighbourhood the whole of the Oats has been sown; and, thanks to the continued and intense frost, they have been well covered in, and the ground finely pulverised over them. Last year we commenced sowing on the 23d March, this year we began on the 26th; and as there were only a few days of difference, we expected, with good weather and pretty hard driving, to make up our lee-way. But here we are stuck up once again. On Saturday last we had a field prepared for being sown with Barley, but on Monday the rain was falling in torrents, a northerly storm having set in. To-day it is no better, heavy showers continue to fall at short intervals; and not only is Barley sowing out of the question, but agricultural labour is all but at a stand still. Patience, it would appear, must be exercised. The work on the earlier farms must now be far behind what it ordinarily is, but in the higher and later districts scarcely anything has as yet been got done. The higher hills all around continue thickly covered with snow, and the path of the plough is still obstructed in many of our highland glens. Vegetation has made a little, yet only a very little, progress in our earlier districts. Wheat, although sadly pale and sickly when it came out from under its winter covering, begins to exhibit signs of life and vigour, and has regained somewhat of its natural green. Grass, which at this season often affords a bite for a hungry animal, has only made the least perceptible advance, whilst the Turnips are well nigh finished in most places. Sheep have finished their proportion of the Turnips, and have left the low country for their hill pasturage, where little will be met with for some time but snow and starvation. Considering the uncommon severity of the winter, sheep have left in better condition than might have been anticipated. Having received higher prices this year than usual for Turnips eaten by sheep, the anxiety was to give over as many for this purpose as could be spared, and failing to calculate on such a perverse winter, our cattle bid fair to be on stinted allowance for a pretty protracted period, should the weather in reserve for us be in any sort of keeping with that we are now experiencing.

Notices to Correspondents.

Bread: *E C.* One sack of good flour will make 100 4 lb. loaves, and a quarter of white Wheat of 62 lbs. per bushel will yield from 390 lbs. to 400 lbs. of flour, from which bran alone has been taken.

Chemical Manure: *Young Farmer.* You had better not attempt to manure your land by artificial manure devised after consideration of what is taken out of the land by your crops. Manure liberally with guano and farm-dung, and you will do better than by any attempt at exact supply of the absent materials of fertility.

Farm Horses: *Decon.* Oats, 1½ bushels per week; Beans, 1 peck; Hay cut into chaff, 28 lbs. per week: Swedes or Carrots, 1 cwt. per week; and Oat straw, 28 lbs. per week—will feed a horse.

Pigeon Manure: *A Subscriber.* Ten or 12 cwts. dried in a lot of turf ashes would be a good dressing for an acre of Turnips. But you must not depend on this alone—there must be a dressing of farm-yard dung also.

MUTUAL LIFE ASSURANCE.

SCOTTISH PROVIDENT INSTITUTION.

The SEVENTEENTH ANNUAL GENERAL MEETING of this SOCIETY was held at Edinburgh, on 21st February,

MR. CHARLES MORTON, Writer to the Signet, the Senior Director, in the Chair.

The CHAIRMAN, after thanking the meeting, and referring briefly to the several topics embraced in the report from the Directors, addressed the meeting on the distinguishing principles of the Institution. He recapitulated the grounds of preference of mutual over proprietary offices, and of the system of moderate premiums and appropriation of the surplus unbroken to those who have made surplus payments over the system of excessive premiums and promiscuous bonuses. The Chairman then said—I believe that most classes who have incomes dependant on their lives have largely availed themselves of Life Assurance: but there is one class of the community I should wish to reach, who do not make so much of its advantages as they ought. I mean the important class of tenant farmers. I have frequently conversed on the subject with farmers, even of superior intelligence, and I have been grieved to find a prejudice prevailing against Assurance, founded very generally on the supposition I have just noticed, that it would be less beneficial in the end than their own savings would be; and founded also on an idea that, though it might be very useful to some classes, it is not of much consequence to them. Now, I think that the class of farmers is just one of the classes to whom Life Assurance is peculiarly valuable. The position of the farmer is often this: He has taken a lease, and, if a person of enterprise, very probably all the capital he has is sunk in the land at the outset. He may die at that stage, and what is then the position of his family? All he has is sunk on the farm, and perhaps his credit is pledged even for something more. His lease cannot be divided—it goes to his eldest son as heir-at-law; and unless his eldest son gets along with it the crop and the stock, he cannot carry on the farm. From what fund, then, are the widow and the younger children to be provided for, if the parent shall have died in such circumstances, and before he has got back from the land, and accumulated as savings, as much of the money expended on it as would form a provision for them? It is clear that, in such a case, they must either be left in poverty, or a burden on the heir; which perhaps he may bear with for a time without a grudge, but which, when he gets a family of his own, may be more than he or the profits of the lease can stand, and may lead even to its surrender and the loss of all the outlay. How often is a farmer's family thus situated, if its head dies early; and how different would be their position and their comfort if he had had the prudence to insure his life! By a very small annual payment, which could never affect his means of cultivating his farm, or even diminish his personal comforts, he might have the satisfaction of knowing that his stock and crop, with his lease, would go unburdened to his eldest son, ensuring a fair and remunerative working of the farm; while his widow and younger children would be comfortably provided for by the sum in his Policy. I feel very strongly the importance of Life Assurance to the farmers, and I am glad to see present a gentleman who has great influence with that important class (the Secretary to the Highland and Agricultural Society), and probably the work in which he has been lately engaged in reporting on the Agricultural Statistics of the country will give him better opportunities of bringing the subject of Life Assurance—a subject in which I know he also takes a warm interest—under their notice. I hope the result may be that we shall see a great many more farmers availing themselves of Life Assurance than there are at present.

W. NEIL COLQUHOUN CAMPBELL, advocate, laid on the table the report by the Directors, which showed that since the commencement of the Institution 7184 policies had been issued, assuring £3,139,416. In the last year the number of new policies was 577, assuring £258,595. The amount of new business is thus somewhat less than the previous year, the diminution having arisen entirely within the last few months, and being easily traceable to commercial depression, following upon high prices and increased taxation.

The report, with the relative states, and the report by the auditors, having been read—

CHARLES HENRY FORBES, Esq., of Kingairloch, said: I beg to move that the highly favourable report we have just heard read be approved of by the contributors. I have been long connected with this Institution, and I can bear witness to the attention paid both by the Directors and those in the management to everything tending to promote the prosperity of the establishment. As one of the class alluded to by the chairman, I can say that in carrying out the operations of a large farm, which I have had occasion to take into my own management, I have derived great benefit from my connexion with this office, and I only wonder that more of the class of farmers have not joined it. It is not the object of the farmer to speculate for bonuses. What he has to do is to secure a provision for his family at the lowest possible outlay, and in no office can he do that with so much advantage to himself as in this office. He may here, without throwing away any of his chance of profits, insure 1000*l.* for the same sum that would only bring him 800*l.* in another office. It is a comfortable thing for a man paying away his money to this society to know that he cannot lose it, for if he happens to die before he has paid up the sum insured, his family is a considerable gainer; and if he is spared till he has paid up that sum, he has the prospect of one of those comfortable bonuses being added to the sum to be paid his relatives at his death. In these times, when taxation and all the necessaries of life are so high, there is an additional motive—I may say duty—for the head of a family to make provision for those he leaves behind him, in order to meet the enhanced price of the necessaries of life, on which their comfort so much depends. I beg to move that the Report now read be approved of.

Mr. WILLIAM GRAY, farmer at Southfield, seconded the motion, and expressed his entire concurrence in the remarks of Mr. Forbes.

The motion was put, and unanimously agreed to.

The Chairman expressed his satisfaction that his remarks had called up two farmers. He would remind them that they were the class at present most able to insure, as while others groaned under high prices they were reaping the advantage. (Laughter.)

Mr. HALL MAXWELL, of Dargavel, Secretary to the Highland and Agricultural Society of Scotland, then said: I have great pleasure in moving that we give the thanks of the meeting to the Directors for their services during the past year. I am quite sure you will all willingly join in the compliment so well earned by these gentlemen, who have devoted so much time and trouble to the promotion of your interests, and to whose industry and intelligence, as well as to the possession of similar qualities by their predecessors in office, we owe in so great a degree the high position which this institution now occupies. The Chairman has been pleased to allude to me in connexion with the great and acknowledged advantages of Life Assurance to the farming community. I apprehend that all I can do in this matter is to express my entire concurrence with what has fallen from the Chairman; but I fear that any attempt on my part to inculcate on the farmers the nature of these advantages might be regarded as somewhat foreign to the functions of my office. At the same time I have that high appreciation of the intelligence of the farmers of Scotland—and certainly there is no man in Scotland who has better opportunities of knowing them than I have—as to feel perfectly convinced that they will year after year become more impressed with these advantages, and that they will year after year more generally avail themselves of them. You say that you have called up two farmers. Why, I think this is altogether a very agricultural meeting—(laughter)—for I have at present other two farmers in my eye, and I must say that, attending, as I sometimes do, on the meetings of other bodies such as this, I do not generally see such meetings graced by so many members of the agricultural profession as this is. As I have said, I sometimes attend other meetings of this kind. As you know, I am connected with another Insurance Company, and as, I dare say, there are many other gentlemen here who are connected with other bodies, I would like to make one observation, and I do it with the best of feeling, in reference to a remark which fell from my friend, Mr. Campbell. Connected as I am with other bodies, I could not subscribe exactly to the doctrine which, I understand, that gentleman laid down, that the Scottish Provident was the only Institution which an insurer should go to. (Laughter) But this I will say, that there is no other office in Scotland I would more willingly and readily, or with greater confidence, go to than the Scottish Provident. (Hear, hear.) To that length I will go, and I think that is the legitimate length to go. Before sitting down, I cannot forbear expressing the gratification afforded me by the unanimous and harmonious manner in which this day's report has been received and approved of. I do trust that our affairs will continue to be managed so as to warrant us to hope that our future meetings will be characterised by that harmony which it is no less our interest than I am sure it is our inclination to promote. I have therefore only to propose that the thanks of this meeting be given to the Directors for their services during the past year.

Mr. GEORGE HOPE, farmer, Fentonbarns, said—As a farmer I rise to second this motion. I had the pleasure, sir, of hearing the greater part of what you said, and was much pleased with the clear and distinct manner in which you pointed out the benefits of life insurance. I was not before aware that the farmers as a body were behindhand in taking advantage of life assurance. For my own part, I see several other farmers present, and I have known several whose farms after their death had been enabled to be carried on at a profit, which would not have been the case had they not left a life insurance policy. I think it is every man's duty, in whatever rank or station of life he may be placed, to insure his life. It is a Christian duty, even although those he leaves do not directly depend upon it, as it is only by the union of numbers that the families of those who die early can be provided for. I may mention, also, in reference to what Mr. Campbell said of the benefits of the Scottish Provident Institution, that it is now some 10 or 12 years since I first joined this Society. At that time I looked most carefully over the terms of the whole of the Life Assurance Societies in Edinburgh, and I came to the decided conviction that the Scottish Provident was the one for my money. Some years afterwards I thought it expedient to effect a second insurance, and, lest I might have been wrong in my first judgment, I determined that I should for the second time carefully examine the principles that regulated the different societies, and again I came back to the Scottish Provident—(hear, hear)—where I had the pleasure of effecting a second insurance. I beg to second the motion.

The motion was agreed to.

The CHAIRMAN then said—I suspect I must have been in some error as to the farmers. (A laugh.) But I think the remarks of our friends will do a great deal of good. They show that those who are in the foremost rank of their own profession are also in advance in other matters affecting their interests. I doubt not their example will be followed by many; and, if so, I will be delighted to come back next year and retract every word I have said as to the farmers to-day.

Mr. CHARLES LAWSON, jun., seedsman, moved the thanks of the contributors to the manager, secretary, and medical officer.

Mr. ROBERT SCLATER moved the thanks of the meeting to the auditors and trustees for their efficient services.

Mr. DAVID RANKIN, postmaster at Kilmarnock, in seconding the motion, made some remarks as to the peculiarly favourable advantage held out by the Scottish Provident Institution to young lives, and dwelt more particularly on this subject in connection with the initiative the Government had recently taken in the promotion of Life Assurance amongst the Post Office officials; and sincerely entertaining a conviction of the superior benefits of this Society, had no doubt but that it would largely participate in the business thus thrown open.

Mr. John Schank More, Professor of Scots Law; Mr. John Fletcher M'Farlan, Chairman of the Chamber of Commerce; and Mr. James Crawford, jun., W.S., were then appointed directors in room of the three retiring; and Mr. Robert Walker (of Bell and Bradfute), publisher, Master of the Merchant Company, was appointed Auditor, in room of Mr. Crawford.

The meeting separated after a vote of thanks to the Chairman.

MUTUAL LIFE ASSURANCE.

SCOTTISH PROVIDENT INSTITUTION.

THE ONLY OFFICE WHICH COMBINES THE ADVANTAGE OF PARTICIPATION IN THE

WHOLE PROFITS WITH MODERATE PREMIUMS.

The Premiums are, at early and middle ages, about a fourth lower than in other mutual or participating Offices. They are as low as the non-participating rates of the Proprietary Companies, which they admit of being, not only with safety but with ample Reversion of Profits to the Policy-holders, being free from the burden of Dividends to shareholders.

Examples of Annual Premium to Assure 100l. at Death.

Age 25	30	35	40	45	50
£1 18 9	£2 1 6	£2 6 10	£2 14 9	£3 5 9	£4 1 7

Thus a person of 30 may secure 1000*l.* at death, for a yearly payment of 20*l.* 15*s.*, which, if paid to any of the other Mutual Offices, would secure a policy for 800*l.* only, instead of 1000*l.*

The arrangement, by which the premiums are reduced to a rate commensurate with the risk, is obviously more suited for securing a competent family provision, in case of early death, than that which, by the same yearly outlay, secures a much smaller present sum, with the hope only of prospective and contingent addition.

PROFITS.

The principle on which the Profits are divided is at once safe, equitable, and favourable to good Lives—the surplus being reserved for those members who alone can have made surplus payments; in other words, for those whose Premiums, with accumulated interest, amount to the sums in their Policies.

The practical working of the system has been, that at the First Division of Surplus—15½ years after the commencement—Bonus Additions have been made to the Policies which have come within the participating class,

Varying from 20 to 54 per cent. on their amount.

In all points of practice — as in provision for the indefeasibility of policies, facility of license for travelling, or residence abroad, and of obtaining advances on the value of the Policies—the regulations of the Society, as well as the administration, are as liberal as is consistent with right principle.

Copies of Reports, explanatory of the principles, with every information, may be had on application at the Head Office, 14, St. Andrew Square, Edinburgh; or at the London Branch, 66, Gracechurch Street, City.

LONDON BRANCH, 66, GRACECHURCH STREET, CITY.

JAMES WATSON, Manager.
GEORGE GRANT, Resident Secretary.

BUDDING'S PATENT
IMPROVED LAWN MOWING MACHINES,

MANUFACTURED AND SOLD BY

J. AND H. FERRABEE,
Phœnix Iron Works, near Stroud, Gloucestershire.

These are the only MOWING MACHINES that can be used by unskilled labourers with equal facility on Lawns, Verges, between Flower beds on Bowling Greens, Cricket, and Pleasure Grounds; 4500 of them have been sold.

Hand Machine, for One Man, cutting	16 inches wide	£5 10s.	0d.
Ditto for Two Men	22 ditto	... 6 0	0
Pony Machine (or Donkey)	26 ditto	... 8 0	0
Horse Machine	28 ditto	... 11 0	0
Ditto	36 ditto	... 15 0	0

London Agency:—The Manager of the Agricultural Department, Baker Street Bazaar.

(Fig. 1.) (Fig. 2.)

J. TYLOR AND SON'S BARROW GARDEN ENGINE (Fig. 1), in best well painted oak tub, fitted with improved Pump, universal joint, and registered Spreader, which answers the purpose of the separate rose fan and jet.

No. 1 holds 10 gallons,	throws 30 feet high	...	£4 10
No. 2 „ 15 „	„ 45 „	...	5 10
No. 3 „ 28 „	„ 45 „	...	6 18

J. TYLOR & SON'S BARROW GARDEN ENGINE (Fig. 2), in strong tinned iron tub, well painted inside and outside, with improved Pump, universal joint, and registered Spreader, which answers the purpose of the separate rose fan and jet.

No. 10 holds 8 gallons,	throws 25 feet high	...	£2 15
No. 13 „ 12 „	„ 30 „	...	3 5
No. 11 „ 16 „	„ 40 „	...	4 0
No. 12 „ 24 „	„ 45 „	...	5 0
No. 14 „ 30 „	„ 45 „	...	5 18

A large assortment of every description of Garden Syringes, Pail Engines, Conservatory Pumps, &c., kept in Stock.

Full size Syringe, on Read's principle, of the very best quality and workmanship, with two roses and one jet, 21s.; Plain Syringes from 10s. 6d. upwards.

J. Tylor & Son's Horticultural Apparatus may be obtained at these prices from any respectable Ironmonger or Seedsmen in town or country, through whom alone they will be supplied, and of whom Drawings and Prices may be had.

N.B. Cost of carriage, &c., not included in these prices.

J. Tylor & Son's Manufactory, Warwick Lane, Newgate Street, London.

J. TYLOR AND SON'S REGISTERED GARDEN SYRINGE.—Small size, for Amateur use, **21s.** each; Large size, for Gardeners' use, **25s.** each.

By a simple arrangement this Syringe is rendered more effective than any portable Conservatory or Garden Pump ever offered to the public. It is equally adapted for Garden or Conservatory use, and is capable of discharging twice as much water in a given time as any other Syringe now in use. The arrangement consists in attaching a small flexible suction tube to the barrel of the Syringe, through which it is filled with water at every discharge of the previous contents. By this means the Syringe is always charged, and the pull-up stroke of the piston rendered perfectly easy, it having, indeed, no work to do, the barrel being previously full of water. Being thus made self-supplying, a great saving of labour is effected: and the necessity of stooping to fill the syringe at every discharge being done away with, the direction of the water can be maintained for any length of time. It is perfectly cleanly in its action, as it is not possible for any water to get on the outside of the barrel, which is a well-known inconvenience attendant on the use of every other Syringe. Its construction is perfectly simple, and cannot get out of order; the ground in ball valves and fittings used for filling all other patent Syringes being entirely superseded. To be had of any respectable Ironmonger or Seedsman in town or country.

J. Tylor & Sons, Manufacturers of Horticultural Apparatus, Warwick Lane, Newgate Street, London.

N.B. These prices do not include carriage, package, or expenses of delivery in the country.

WILLIAM DRAY AND CO.'S STEEL DIGGING FORKS are warranted equal, and by many are considered superior, to any in use. Three Tine Forks, 4s. 6d. each; Four Tine Forks, 5s. 6d. each. A liberal allowance on Wholesale Orders.

William Dray & Co., Swan Lane, Upper Thames Street, near London Bridge.

PARKES' STEEL DIGGING FORKS & DRAINING TOOLS.

MESSRS. BURGESS AND KEY, as Mr. Parkes' Wholesale Agents for England, have always in stock a large assortment. These Forks and Tools are now in use by upwards of 1000 of the Nobility and Farmers, members of the Royal Agricultural Society, who pronounce them to be the best ever invented, and to facilitate labour at least 20 per cent. Price Lists sent free on application, and Illustrated Catalogue of the best Farm Implements, on receipt of eight postage stamps.

103, Newgate Street, and 52, Little Britain, London.

RICHMOND & CHANDLER'S PATENT CHAFF CUTTING MACHINE.

All the various modern Implements of Agriculture manufactured on the most scientific and improved principles, suitable for home use and exportation.—Address, Richmond & Chandler, Salford, Manchester; and 32, South John Street, Liverpool.

☞ Catalogues Gratis.

MANGER, RACK, & WATER-TROUGH AS ONE FIXTURE
Improved and Newly Patented.

COTTAM AND HALLEN, the original inventors, obtained the Great Exhibition Prize Medal for this arrangement, to which all the latest improvements are adapted, secured by Patent, including a method entirely new of attaching the halter-weight and rein from the back of the manger to the under front of the plate, allowing the horse greater freedom, and being noiseless in operation, add much to its comfort whilst feeding and convenience when at rest, as likewise, from their position, avoiding the liability of the most restive horse getting cast. No well-managed stable should be without these fittings.

COTTAM'S ENAMELLED MANGERS are constructed in the best possible manner, both as to form and utility; are cleanly in appearance, durable, and impervious to infection; manufactured Plain, Galvanised, and Enamelled. Improved Surface Drain, with Safety Covers, Sanitary Traps, Stable Pumps, Loose Box, Fittings, Gutta Percha Preserving Saddle and Harness Brackets, and every article in Stable Furniture, in stock. An extensive assortment of Patterns for both Plain and Ornamental Castings, and every description of Wrought and Cast Iron Work for building and other purposes. Agricultural and Horticultural Implements, Iron Gates, both plain and ornamental, Hurdles, Strain Fencing, &c.

Estimates and Catalogues on application to Cottam & Hallen, 2, Winsley Street, Oxford Street.

WARMING AND VENTILATING.

JOHN WARNER AND SONS, 8, Jewin Crescent, London, Manufacturers of FIRE ENGINES, PUMPS, GARDEN ENGINES, and SYRINGES.

Brass Syringes, 9s. to 18s.

All articles of John Warner & Sons' manufacture may be obtained of any Ironmonger or Plumber in town or country, at the advertised prices.

John Warner & Sons having been practical Horticulturists for many years, know exactly the requirements of both Amateurs and Gardeners. A gardener with a properly constructed pump will get through as much work in five minutes as he could with any Syringe in a quarter of an hour, and with half the labour to himself. Syringes are economical for small houses.

No establishment offers such a variety of effective machines for hydraulic purposes, whether to supply Gardens, Hothouses, Cottages, Farms, Mansions, or Boards of Health, with every requisite connected with the conveyance and distribution of liquids.

Fountains suitable for Conservatories, Lawns, &c.

Sheets of Engravings sent on application.

JOHN WARNER AND SONS,
Crescent, Jewin Street, London.
GALVANISED IRON TUB GARDEN ENGINE,
With Warner's Registered Spreader,

is strongly recommended, for durability and low price, viz., 2l. 19s., to hold 10 gallons.

Larger sizes in wood or iron. May be obtained of any Ironmonger or Plumber in town or country, or of the Patentees and Manufacturers, as also Machinery of all kinds for raising Water from any depth to any height by Steam, Horse, or Manual Power. Prices sent on application. Syringes of various constructions and sizes from 9s. upwards. Metallic String from 5d. to 1s. 3d. per ft.

WARNER'S IMPROVED LIQUID MANURE, OR GENERAL PORTABLE PUMP.

The valve is a ball of imperishable material, and cannot clog in action. The barrel is of galvanised iron, not likely to corrode, and can be raised or lowered at pleasure. The legs will fold together, and the whole may be carried on shoulder to any pond or tank required.

Price of 4½ in. Pump, with legs, 3l. 3s. The barrel is 27½ in. long, and the legs are 5 ft. high.

1½ inch Gutta Percha Suction Pipe, 1s. 6d. per foot.

1½ inch Flexible Rubber and Canvas Suction Pipe, 3s. 6d. per foot.

May be obtained of any Ironmonger or Plumber in town or country, at the above prices, or of the Patentees and Manufacturers, John Warner & Sons, 8, Crescent, Jewin Street, London.

Every description of Machinery for Raising Water, by means of Wheels, Rams, Deep Well Pumps, &c.; also Fire and Garden Engines, &c.—Engravings sent on application.

WARNER'S PATENT VIBRATING STANDARD PUMPS.

PATENT CAST-IRON PUMPS, for the use of Farms, Cottages, Manure Tanks, and Wells of a depth not exceeding 30 feet.

Diameter of Barrel	Length of Barrel, under nose.		£ s. d.
2½ in.	short 1 ft. 7 in.	Fitted for lead, gutta percha, or cast iron flanged pipe, as required.	1 12
2½ „	long 3 „ 3 „		1 15
3 „	ditto 3 „ 6 „		2 17
3½ „	ditto 3 „ 6 „		2 18
4 „	ditto 3 „ 6 „		3 5
2½ „	short, with 15 feet of Lead Pipe attached, and Bolts and Nuts ready for fixing		2 19
2½ in.	long ditto	ditto ditto	2 15

The short barrel Pump is very convenient for fixing in situations of limited height and space, for the supply of coppers and sinks in Wash-houses with soft water from underground tanks, or in Hot, Forcing, and Plant Houses; they may be fixed, when desired, under the stage.

May be obtained of any Ironmonger or Plumber in Town or Country, at the above prices, or of the Patentees and Manufacturers, JOHN WARNER AND SONS, 8, Crescent, Jewin Street, London.

Every description of Machinery for Raising Water, by means of Wheels, Rams, Deep Well Pumps, &c.; also Fire and Garden Engines, &c. &c.—Engravings sent on application.

MESSRS. SHOOLBRED AND BRADSHAW, 34, Jermyn Street, Patentees—Manufacturers of every description of ELASTICAL SURGICAL BANDAGES, as recommended by all the most eminent surgeons—in acknowledging the very extensive support they have received, beg to call attention to the various improvements they are making in patent Elastic Stockings, Knee Caps, Socks, and Ladies and Gentlemen's Spine Supporters. A new description of Belt, invaluable for prevention of Cholera and the cure of Rheumatism, Lumbago, &c. N.B. Every description of India-rubber Bandages vulcanised on the newest principle.

HORTICULTURE IN ALL ITS BRANCHES.

JOHN WEEKS & Co., King's Road, Chelsea,

HOTHOUSE BUILDERS.

THE NOBILITY AND GENTRY about to erect Horticultural Buildings, or fix Hot-water Apparatus, will find at our Horticultural Establishment and Hothouse Works, King's Road, Chelsea, an extensive variety of Hothouses, Greenhouses, Conservatories, Pits, &c., erected, and in full operation, combining all modern improvements, so that a lady or gentleman can select the description of House best adapted for every required purpose.

The HOT-WATER APPARATUS, which passes through all the Houses and Pits, affording both top and bottom heat, is in constant operation and particularly worthy of attention.

Many of the Houses and Pits are of wide and lofty dimensions and together equal in length 1000 feet. They are all effectually heated by *one boiler*, which, during the severe winter months does not cost in labour and fuel more than 3*s*. 8*d*. per day, and the apparatus is so arranged that each House or Pit may be heated separately and to the required temperature. The splendid collections of Stove and Greenhouse Plants are also in the highest state of cultivation, and for sale at very low prices. Also a fine collection of strong Grape Vines in pots, from eyes, all the best sorts.

Plans, Models, and Estimates of Horticultural Buildings: also Catalogues of Plants, Vines, Seeds, &c., forwarded on application to JOHN WEEKS & Co., King's Road, Chelsea, London.

HOTHOUSES, CONSERVATORIES, FRAMES & LIGHTS FOR PITS, CUCUMBER & MELON BOXES & LIGHTS.

JAMES WATTS, HOTHOUSE BUILDER, 8, Claremont Place, Old Kent Road, London.

Green and Hothouses, 9, 10, 11, 12, 13, and 14 feet wide, any length, from 16 to 100 feet. Frames and Lights for Pits, 6 ft. 6 in., 7 ft., 7 ft. 6 in., 8 ft., and 8 ft. 6 in. wide, any length, from 12 to 100 feet. Upwards of 200 Cucumber and Melon Boxes and Lights, from 4 ft. by 3 to 10 ft. 6 in. by 5 ft. 6 in., kept ready glazed with stout sheet glass, painted four times, complete, ready for immediate use, all made of best material, packed and sent to all parts of the kingdom.—Reference may be had to the Nobility, Gentry, and the Trade, in most of the counties in England.

WEIR'S IRRIGATORS, LIQUID MANURE PUMPS, FIRE AND GARDEN ENGINES.

EDWARD WEIR, Agricultural Engineer, 16, Bath Place, New Road, London, removed from Oxford Street.

IMPROVED MOWING AND ROLLING MACHINE.

ALEXANDER SHANKS AND SON, Arbroath,

Forfarshire, Inventors and Sole Manufacturers, respectfully solicit the attention of the Nobility, Gentry, and Gardeners to their Improved Machine for Mowing and Rolling Lawns. The Machine is in operation in the Royal Gardens at Windsor Castle, Buckingham Palace, and at Osborne, in the Botanical Gardens at Kew, Regent's Park, Manchester, Sheffield, &c.; at Worsheim Palace, Trentham, Cleveden, Elvaston, Broadlands, Welbourn Abbey, Clumber, Lilleshall, Castle Howard, Shrubland, Bridge Castle, Enville Hall, Tiptree Hall, Chatsworth, and in many other of the principal gardens in the kingdom as well as in the United States, British America, and on the Continent, where its merits have been fully proved, and its success established.

The machine is made to cut the breadth of 42, 30, 20, and 15 inches respectively, is exceedingly durable, easily managed, and adjusted to cut to the length required. The execution of the work is far superior to what may be attained by the most skilful mower, while at the same time a great saving of labour is effected, and the turf much improved. By the largest machine a Scotch acre may be mowed, rolled, and the Grass collected in one hour.

A. S. and Son have much pleasure in stating that they have made considerable improvements in their 15-inch or hand machine this year, by which the draught is considerably lessened. This machine combines all the merits and advantages of the larger machines with firm and secure construction, and is admirably adapted for borders and for lawns of no great extent.

ALEXANDER SHANKS and SON also respectfully solicit notice of "Fleming's Weeding or Salting Machine" for destroying weeds in gravel walks, court-yards, drives, &c. This machine is now in operation in many parts of England, where it has given ample satisfaction as the best and most economical means of thoroughly keeping down weeds or Moss

Further particulars, with testimonials and prices, may be had on application.

TANNED NETTING, for the protection of Fruit Trees from frost, blight, and birds, and for the security of fresh sown seeds, either in Gardens or Fields, at 1*d*. per square yard: 200 yards, 14*s*.: 500 yards, 30*s*.; 1000 yards, 50*s*. Scrim Canvas, for Wall Fruit.—At EDGINGTON and Co.'s, Rick Cloth, Tent, and Waterproof Cloth Manufacturers, 17, Smithfield Bars, City, and Old Kent Road, Southwark; Emigrant Outfitters, Ship Chandlers, and Export Merchants, Brunswick Street, near the East India Export Dock, Blackwall.

All the above can be made any width at proportionate prices. If the upper half is a coarse mesh, it will reduce the prices one-fourth. Galvanised Sparrow-proof Netting for Pheasantries, 3*d*. per square foot. Patterns forwarded post free.

Manufactured by BARNARD & BISHOP, Market Place, Norwich, and delivered free of expense in London, Peterborough, Hull, or Newcastle.

NEW AND IMPORTANT LEVELLING INSTRUMENT.

GILLESPIE'S PATENT INCLINOMETER, for

Taking, Fixing, and Adjusting Surface Slopes of Lands, Earthen Embankments, Railway Gradients, &c., and the Dip, Outfall, or Rise of Drains, Water Courses, &c., and universally applicable to determine the plans and aid the execution of all levelling or sloping operations known in civil engineering.

PRICES:—Inclinometer, with mahogany frame and brass mounting ... ... £3 3*s*. 0*d*.
Do. with oak frame and wrought iron mounting 2 12 0
Light Telescope, 10*s*. 6*d*. extra.

TESTIMONIALS.

From Mr. James Gentles, Contractor.—"I have for a considerable time past used Gillespie's Patent Inclinometer in extensive drainage operations carried on by me, and I have found it to be of the greatest service, in showing the minutest slope in the ground, and in saving of labour; and I could not have constructed many of the drains with any degree of accuracy without its assistance."—James Gentles, Hart Hill, by Whitburn.

Extract of a letter from John Mitchell, Esq., Stand Hill, Bathgate.—"I highly appreciate its capabilities as a levelling instrument. In level lands, where there is a difficulty in detecting in which direction the land slopes, it is invaluable."

Extract of a letter from Mr. John Turner, Surveyor, Whitburn.—"The more I have tested it the more have I appreciated its value. By this invention the power of levelling is brought within the reach of all men of ordinary capacity."

Sold by WILLIAM DRAY & Co., Engineers, &c., Swan Lane, London. Specimens and Models may be seen at their Warerooms. Also a Descriptive Treatise on the nature and uses of the Patent Inclinometer, and copies of Recommendations of its efficiency and value to be had on application.

WATER YOUR GARDENS WITH THE PATENT FLEXIBLE GUTTA PERCHA TUBING, from 4*d*. per foot. Roses, from 4*s*. Union Joints, from 1*s*. 6*d*. each, fitted complete.

Instructions given to affix joints to Taps.—Post Office Orders payable at City Road Branch.

Address JAMES W. WATTS, Factory, 27, City Road, London.

WANTED, THREE HUNDRED POUNDS, for a term of years, for which 20*l*. per annum will be given. None but principals or their solicitors need apply.—Letters addressed to W. F., Mr. Wedge, Post Office, Chichester.

BASS'S EAST INDIA PALE ALE. BARCLAY'S PORTER and STOUT, in 18-gallon Casks, Bottles, Half-Bottles, and Imperial Pints.

BERRY, BROTHERS, & Co., 3, St. James's Street, London.

GLENFIELD PATENT STARCH, used in the Royal Laundry, and pronounced by her Majesty's Laundress to be the finest Starch she ever used.

Sold by all Chandlers, Grocers, &c. &c.

METCALFE, BINGLEY, AND CO.'S OATMEAL and CAMPHOR SOAP, in tablets (registered Nov. 3, 1854). Price 6*d*. each. This soap will be found the purest and most perfect winter soap ever introduced to the public. No. 39, Oxford Street (corner of Newman Street); 1, 2, and 3, Newman Street; and 4 & 5, Perry's Place.

THE SUCCESSFUL RESULTS OF THE LAST HALF CENTURY HAVE PROVED BEYOND QUESTION THAT

ROWLAND'S MACASSAR OIL possesses peculiarly nourishing powers in the growth, restoration, and improvement of the human Hair, and is now universally acknowledged to be the cheapest, and superior to all other preparations for the hair. It prevents it from falling off or turning grey, strengthens weak hair, produces a thick and luxuriant growth, cleanses it from scurf and dandriff, and makes it beautifully soft, curly, and glossy. In the growth of the Beard, Whiskers, Eyebrows, and Moustachios, it is unfailing in its stimulative operation. For children it is especially recommended, as forming the basis of a beautiful head of hair. Price 3s. 6d. and 7s.; Family Bottles (equal to four small), 10s. 6d.; and double that size, 21s. CAUTION.—On the wrapper of each bottle are the words, Rowlands' Macassar Oil, in two lines.—Sold by A. ROWLAND & SONS, 20, Hatton Garden, London, and by Chemists and Perfumers.

DO YOU WANT LUXURIANT HAIR WHISKERS, &c.?—12,000 testimonials prove the magical powers of NIOUKRENE. In all cases, even where everything else has failed, it will be found efficacious in reproducing the hair when lost either by disease or decay, checking premature greyness, strengthening weak hair, and preventing its falling off, &c. For the production of Whiskers and Moustaches in two or three weeks it is guaranteed as certain. Sent, post free, on receipt of 24 penny post stamps, by MISS GRAHAM, 10, Chichester Place, King's Cross, London. "It produced a fine pair of whiskers in less than a month." *R. Lowell, Esq.*—"I have recommended it to many of my patients, who have found it successful." *Dr. Simpson.*—"I was bald 17 years, and it entirely reproduced my hair." *Mr. W. Long.*—"It quite checked the greyness." *Mrs. Swart.*

DO YOU WANT LUXURIANT HAIR, WHISKERS, &c.?—No other compound for the Hair has maintained such an enduring celebrity as EMILY DEAN'S CRINILENE. It is guaranteed to produce Whiskers, Moustachios, Eyebrows, &c., in a few weeks, and restore the Hair in Baldness, from whatever cause, strengthen it when weak, prevent its falling off, and effectually check Greyness in all its stages. For the nursery, Dr. Wilson says it is unrivalled.—Price 2s. per Package; sent post free, on receipt of 24 penny postage stamps, by Miss DEAN, 37 A, Manchester Street, Gray's Inn Road, London. Sold by every Chemist in the Kingdom.—"In one fortnight it produced a beautiful set of moustachios." H. ADAMS.—"It has prevented my hair falling off." J. HICKSON.—"It has quite checked the greyness that was coming on." Mrs. ELDER.
Beware of imitations under closely similar names.

TO NERVOUS SUFFERERS.

A RETIRED CLERGYMAN having been restored to health in a few days, after many years of great nervous suffering, is anxious to communicate to others the means of cure; he will therefore send (free), on receiving a stamped envelope, properly addressed, a copy of the prescription used.—Direct Rev. E. DOUGLASS, 18, Holland Street, Brixton, London.

DR. DE JONGH'S

LIGHT BROWN COD LIVER OIL.—This OIL long known, extensively prescribed, and highly appreciated on the Continent, has now, in consequence of its proved superior power and efficacy, acquired the general and entire confidence of the medical profession in this country. It is of the purest and finest quality, free from admixture and adulteration, or the usually repulsive and nauseous flavour, or sickly after-taste of the pale Oil, or of the coarse brown Oil commonly sold, though totally unfit for medicinal use. It is as low in price per ounce as any other genuine Cod Liver Oil, whilst its regular and speedy effects render it incalculably cheaper. Medical and scientific testimonials of the highest character delivered or forwarded gratis on application.—Sold in bottles, capsuled and labelled, with Dr. De Jongh's stamp and signature, WITHOUT WHICH NONE ARE GENUINE, by ANSAR, HARFORD, and CO., 77, STRAND, London, Dr. De Jongh's sole accredited Agents; and by respectable Chemists in Town and Country. Half-pints (10 oz.), 2s. 6d.; Pints (20 oz.), 4s. 9d.; Quarts (40 oz.), 9s. IMPERIAL MEASURE.

HOLLOWAY'S OINTMENT AND PILLS, EXTRAORDINARY REMEDIES FOR THE CURE OF BAD LEGS.—Extract of a letter from Mr. John Anthony, residing near Llandovery, dated March 16, 1855:—To Professor HOLLOWAY. "Sir, I suffered for 10 years with a bad leg, apparently a white swelling, which caused me to keep my bed for two years: from an injury afterwards it turned into a wound, and 16 pieces of bone were taken out. I tried several medical men, but they could not cure my leg: I am, however, happy to to say that your Ointment and Pills effectually healed the wound in about a month."—Sold by all Medicine Vendors, and at Professor HOLLOWAY's Establishments, 244, Strand, London, and 80, Maiden Lane, New York.

DINNEFORD'S PURE FLUID MAGNESIA has been for many years sanctioned by the most eminent of the Medical Profession, as an excellent remedy for Acidities, Heartburn, Headache, Gout, and Indigestion. As a mild aperient, it is admirably adapted for delicate females, particularly during pregnancy; and it prevents the food of infants from turning sour during digestion. Combined with the Acidulated Lemon Syrup, it forms an Effervescing Aperient Draught, which is highly agreeable and efficacious.—Prepared by DINNEFORD & Co., Dispensing Chemists (and General Agents for the Improved Horse-Hair Gloves and Belts), 172, New Bond Street, London, and Sold by all respectable Chemists throughout the Empire.

EFFECTUAL SUPPORT FOR VARICOSE VEINS.—This beautifully elastic compressing Stocking is pervious, light, inexpensive, and easily drawn on without lacing or bandaging. Instructions for measurement with prices on application, and the articles sent by post from the Manufacturers, POPE & PLANTE, 4, Waterloo Place, Pall Mall, London.

RUPTURES EFFECTUALLY CURED WITHOUT A TRUSS.—All sufferers from this alarming complaint are earnestly invited to consult or write to Dr. LESLIE, as he guarantees them relief in every case. His remedy has been successful in curing thousands of persons during the last twelve years, and is applicable to every kind of single and double rupture, however bad or long standing, in male or female of any age, causing no confinement or inconvenience in its use whatever. Sent post free to any part of the world, with full instructions for use, on receipt of 7s. 6d. in postage stamps, cash, or post-office order, payable at the General Post-office, to Dr. HERBERT LESLIE, 37A, Manchester Street, Gray's Inn Road, London. At home daily (except Sunday) from 11 till 4 o'clock. A Pamphlet of Testimonials sent post free on receipt of one postage stamp.

Already published,

Vols. I. to V., each 1s. 6d., or Vols. I. to IV., in Double Vols., each 3s. 6d.; also PARTS I. to XVI., and NUMBERS 1 to 69.

"'Dr. Lardner's Museum,' one of the few works of the kind which can be recommended as at once popular and accurate."—*Sir David Brewster.*

"This Series, besides affording popular but sound instruction on scientific subjects, with which the humblest man in the country ought to be acquainted, also undertakes that teaching of 'Common Things' which Lord Ashburton and every well wisher of his kind are anxious to promote. Many thousand copies of this serviceable publication have been printed, in the belief and hope that the desire for instruction and improvement widely prevails; and we have no fear that such enlightened faith will meet with disappointment."—*The Times*, Feb. 9, 1854.

☞ This work is continued in Weekly Numbers at 1d.; Monthly Parts at 5d.; Quarterly Volumes at 1s. 6d.; and Half-yearly Volumes at 3s. 6d.

Post-office orders to be made payable to JAMES MATTHEWS, 5, Upper Wellington Street, Covent Garden, London.

TO GARDENERS AND OTHERS.

TO BE LET, within an easy distance of Covent Garden, a FLORIST BUSINESS, with four Large Greenhouses, a Propagating-house, with Pits, Frames, &c., with about half an acre of land, walled in, and a good stock of plants for market; rent moderate.—For particulars apply to T. B., Office of this Paper.

TO BE LET, in a new neighbourhood and close to the town of Rugby, a SMALL NURSERY and MARKET GARDEN. The Ground is well cropped, there is a span-roofed House, Stock of Plants, Pits, Frames, &c. Capital Plots of Strawberries, Fruit Trees in full bearing, Shrubs, &c.—Apply to R. VINCENT, Hill Street, Rugby.

HIGHLANDS OF PERTHSHIRE.

TO BE LET, CASTLE MENZIES and SHOOTINGS; the House, as furnished, affording ample accommodation for a numerous family and establishment, along with 10,000 acres of Muir and Low Ground Shootings. The stock of Game, which has been strictly protected and well preserved, will be found good, healthy, and of all the usual descriptions; and Salmon Fishing is to be had along the banks of the Tay and Lyon, which bound the property for six miles. The post passes the gate, and from Aberfeldy (two miles distant) coaches proceed in all directions. Supplies are easily procured. The climate is exceedingly good; and the place would be equally suitable as a permanent residence or as a shooting quarter.—Apply to ARCHIBALD CAMPBELL, Camserney Cottage, by Aberfeldy.

HOUSE AND SHOOTING.—ISLAND OF MULL.

TO BE LET, CARSAIG HOUSE, beautifully situated on the South Coast of Mull. It contains three public rooms, seven bed-rooms, three dressing-closets, and a bath, ample accommodation for servants, and is well supplied with water. The tenant may have accommodation for two or three horses, and may have a pasture for two cows, or be supplied with dairy produce. There is a good Vegetable Garden. The Shooting extends over about 5000 acres, which have been very little shot over for many years. Other 4000 or 5000 acres adjacent may be obtained. The Game consists of grouse, black game, partridge, hare, and rabbits, and occasionally red deer. The Sea Fishing is excellent, and there are two small Trouting Streams on the Estate. There is a commodious Quay and Landing-place, and Steam-boats pass the house in the summer three times a-week.

FARM WITH RESIDENCE.

WANTED TO RENT, upon an improving lease, an ARABLE FARM of not less than 500 acres, with house and garden suited to a gentleman's residence. The situation must be easily accessible from London, and near a first-class railway station south of the Thames will be preferred. The occupation will be very beneficial to the property; most satisfactory references both as to means and agricultural skill will be readily afforded.—Address, with full particulars, to Messrs. DAVIS & VIGERS, 3, Frederick's Place, Old Jewry, London.

TO BE SOLD, by private treaty, a NURSERY and PLANT BUSINESS, established nearly 70 years. The Proprietor of this old-established Nursery Business is willing to retire, and dispose of the Stock and Good-will. The nursery comprises about 20 acres of ground, and about 15 large and commodious Stove, Greenhouse, and Propagating Houses, with numerous Pits, frames, &c. *The business is in full working order, and is capable of being increased to almost any extent, and of being made one of the best provincial nurseries in the kingdom.* The stock is in a flourishing condition, being young, healthy, and in good saleable order, and comprises a general assortment of all the most saleable Forest Trees, Shrubs, Fruit Trees, Stove, Greenhouse, and Miscellaneous Plants. The Nurseries are situated close and adjoining one of the largest towns in the West of England, with a population of more than 100,000 inhabitants. The whole of the land, houses, &c., belongs to the proprietor, *who will have no objection to grant a long lease to his successor or successors, and at least one half of the purchase money could remain on security at common interest.* The business has been carried on with great success by the present proprietor, which partly contributes to his retiring from the business. None but principals and *bonâ fide* purchasers will be treated with.—Apply to Mr. WILLIAM E. RENDLE, Union Road, Plymouth.

TO SPORTSMEN, STOCK-FARMERS, ETC.

TO BE SOLD, a range of nearly 6000 acres of easily-travelled GROUSING GROUND, not surpassed in the Lowlands of Scotland for its sporting qualifications, and watered by several small Trouting Streams, having also a comfortable Small Lodge, all situated in the midst of several strictly preserved estates, in one of the most southerly counties, and of easy access from England or elsewhere, from being within five miles of a seaport, as well as forming a very improving and easily-managed investment as a Stock Farm for a moderate capital. The proprietor is ready to treat for a Sale of the same.—Apply, free, to No. 639, N.B.A.O., Edinburgh.

TO BE SOLD, three strong built GREENHOUSES. One 18 ft. by 10 ft.; 14 ft. by 10 ft.; 10 ft. by 8 ft.; glazed with strong 16-oz. glass.—Address, pre-paid, to W. SMITH, 85, White Lion Street, Pentonville.

TO BE SOLD, BUFF COCHIN CHICKENS, from first class Prize Birds, Brahma Pootra Chickens, from imported American Prize Birds, and Spanish Chickens. Also some very good one-year-old Birds of the above descriptions. Wire, Game, and Poultry Netting, Poultry Hurdles, Hen-houses, Chicken Coops, Flower Stands, and Trainers, Garden Arches, and every kind of Wire Work, useful and ornamental.—T. H. FOX'S, City of London Wire Works, 44, Skinner Street, and 6 & 8, Snow Hill. Illustrated Catalogues forwarded post free.

TO BE SOLD immediately, FANCY and USEFUL POULTRY, all kinds, from 12s. to 30s. each. Black, Norfolk, and White Turkies; splendid Brahma Pootras; Silver, Cinnamon, Buff, White, and Grouse Cochins; Aylesbury Ducks of the purest stock. Also three splendid White Poland Fowls; some of these birds now lay, and their eggs will be sold from 6d. to 5s. each; also the noted large Grey Cambridge Turkey Eggs. As the owner wishes to part with all the poultry, address and make Post-office Orders payable to Mr. SAMUEL NEWMAN, 7, St. Giles Street, Norwich.

TO BE SOLD, EGGS and FOWLS of profitable and ornamental Poultry of the best breeds, from Cochin to Bantams, at reduced prices, in consequence of a new fowl-house being constructed.—For particulars apply to F. M., Mr. Eccles, Woodstock.

DORKING BLUE MOTTLED FOWLS' EGGS, 12s. per dozen. Took first Prize at Brighton Exhibition of three counties, 1854.—Address Mr. ED. HENDEN, Beehive Inn, Dorking, Surrey.

TO GENTLEMEN, FLORISTS, AND OTHERS.

MESSRS. PROTHEROE AND MORRIS will sell by Auction, at the Mart, Bartholomew Lane, on THURSDAY, April 19, at 12 o'clock, a first-class collection of CARNATIONS, PICOTEES, and PINKS, from a celebrated grower; a choice assortment of American Plants, Standard and Dwarf Roses, Dahlias in dry roots, Camellias, Fuchsias, Verbenas, Azalea indica, &c.—On view the morning of sale; Catalogues had at the Mart; and of the Auctioneers, American Nursery, Leytonstone, Essex.

ORCHIDS FROM INDIA.

MR. J. C. STEVENS will Sell by Auction, at his Great Room, 38, King Street, Covent Garden, on TUESDAY, 24th April, at 12 o'clock, an importation of 11 cases of ORCHIDS just received per Overland Route; they have arrived in the best possible state, and contain the finest parcel of Saccolabium retusum that has ever reached this country; also large masses of Dendrobium Devonianum, formosum, Cambridgeanum, clavatum, transparens, Falconerianum, and a new yellow species—Cœlogyne Wallichi, a new Cymbidium, Vanda Jenkinsoniana, &c. &c.—May be viewed on the morning of sale, and Catalogues had of Mr. J. C. STEVENS, 38, King Street, Covent Garden.

MESSRS. SURRIDGE AND SONS have been favoured with instructions from J. J. MECHI, Esq., to submit to unreserved Sale by Auction, on TUESDAY, 24th of April inst., at the Ship Inn, near Tiptree Hall, a large number of useful FARM IMPLEMENTS, mostly rendered unnecessary by the new system of irrigation, &c., and many others purchased experimentally, or presented to him, consisting of Land-ditching Tools, Steel Digging Forks, Iron Pig Troughs, Tanks, Lord Ducie's Drag, Coleman's and other Stetch Scarifiers, Garrett's Manure and Seed Drills, Bean and Linseed Crushers, Chaff Cutters; Smith's, Ransome's, Scotch, and other strong Iron Subsoil and Surface Ploughs; Norwegian Harrow, Hussey's Reaping Machine, &c. &c., full particulars of which will be given in Catalogues, to be had at the Auctioneers' Offices, Inworth Hall, Coggeshall and Halsted, or posted free, on application.

N.B. The Sale will commence at 1 o'clock. Gentlemen leaving London by the 11 o'clock train will, on their arrival at Kelvedon, be able to procure immediate conveyance to the place of sale.

IMPORTANT SALE OF HURDLES, GATES, CONSERVATORIES, HAND-GLASSES, IRON BUILDINGS, ETC.

TO BE SOLD BY AUCTION, on MONDAY, the 30th of April, on the premises of Boydell and Glasier, Camden Works, Hawley Crescent, near the Canal Bridge, Camden Town, London, about 2000 Patent Twisted IRON HURDLES, 14 CONSERVATORIES, 200 Patent HAND-GLASSES, 50 IRON HOUSES, suitable for labourers' Cottages, out-buildings, &c. Arrangements will be made to erect the Conservatories and Houses within a given distance of London.—May be seen, and Catalogues had on the premises, one week prior to the sale.

HORTICULTURAL BUILDING AND HEATING BY HOT WATER.

AT THE LOWEST PRICES CONSISTENT WITH GOOD MATERIALS & WORKMANSHIP

GRAY & ORMSON, DANVERS STREET, CHELSEA, LONDON.

GRAY AND ORMSON, Danvers Street, Chelsea, having had considerable experience in the construction of Horticultural Erections, which, for elegance of design, good materials, and workmanship, combined with economy and practical adaptation, cannot be surpassed by anything of the kind in the country, are in a position to execute orders on the lowest possible terms.

G. & O. have been extensively employed by the Nobility, Gentry, and London Nurserymen; and they can with the greatest confidence give the most satisfactory references to all by whom they have been favoured with orders. Their Hot-water Apparatus is also constructed on the most approved and scientific principles, for all purposes to which the application of Heating by Hot Water can be made available.

READ'S GARDEN ENGINES, SYRINGES, &c.

WHEN an article of real utility attracts public attention, IMITATORS start into the field to snatch from the inventor the just reward of his labours. It has now become a daily practice of exhibiting in the windows of ironmongers and other, Syringes of the VERY COMMONEST DESCRIPTION, with the words "READ'S PATENT," as an inducement to purchasers. This, as an eminent writer on Horticulture has recently remarked on the subject, is indeed "living upon another man's fame."

READ'S Instruments have the ROYAL ARMS, with the Address—35, REGENT CIRCUS, LONDON.

*** A liberal discount allowed to Nurserymen, Seedsmen, &c., &c.—Descriptions sent Post free.

MOORE'S PATENT VENTILATOR, for every Description of Farm-Buildings, Conservatories, Hot-houses, Warehouses, Market-houses, Bell-turrets, also for Ventilating Shafts, &c.

These Ventilators are fitted to side-slips of wood with iron levers, iron flanges, and brass screws, with rough plate, or fine sheet glass, at 4s. per foot super. 2s. 6d. extra for necessary fittings to each Ventilator. If with brass levers in place of iron, 4s. per pair extra. It is presumed the accompanying drawing of a Greenhouse will show the advantages obtained (independently of a most perfect system of Ventilation, by admitting any amount of fresh air and distributing equally over the plants, &c., and at the same time emitting the vitiated), viz., a much neater appearance, and an uninterrupted view of the whole interior. Greenhouses at Mr. James Veitch, Jun., Exotic Nursery, King's Road, Chelsea; Messrs. Veitch & Sons, Nursery, Exeter; Messrs. Messrs. Perry, Nursery, Banbury; and the Pleasure Grounds, Hampton Court Palace; having been fitted with these Ventilators with perfect success, the Patentee has obtained permission to refer to the above places all parties desirous of seeing the same.

These Ventilators have been applied to many other Greenhouses, Conservatories, &c., but they are not published, in order to avoid giving unnecessary trouble. Fifty-four of these Ventilators, 5 ft. square (34 on the roof at an angle of 60 degrees) have been fitted at Her Majesty's Saltpetre Works, Waltham Abbey, the success of which has been proved by the fact, that the saltpetre is crystalised in little more than half the time, previously, the light and ventilation obtained by the adoption of these Ventilators.

MOORE'S double-current Ventilators for External Walls, &c. Ventilators for every description of apartment, from the cottage to the Palace. Stained and Ornamental Glass if required. In taking the size, the exact opening should be given, stating the height and width distinctly. Tariff Prices of the various Ventilators may be had on application at either of the undermentioned addresses. Packing cases allowed full price when returned carriage paid.

N.B.—These Ventilators can be readily fitted to Greenhouses already erected, by removing the entire sashes and fixing the Ventilators in their places.

PERFECT VENTILATION IN ALL CASES GUARANTEED.

Church, Turret, Musical and House Clock Makers, to the Lords of the Admiralty, the Hon. Board of Ordnance, the Emperor of China, &c.

London: 81, Fleet Street, London.—Manufactory, Sekforde Works, Clerkenwell.

ONE THOUSAND BEDSTEADS TO CHOOSE FROM.—HEAL AND SON have just erected extensive Premises, which enable them to keep upwards of 1000 Bedsteads in stock, 150 of which are fixed for inspection, comprising every variety of Brass, Wood, and Iron, with Chintz and Damask Furnitures complete. Their new Warerooms also contain an assortment of BED-ROOM FURNITURE, which comprises every requisite, from the plainest japanned deal for servants' rooms, to the newest and most tasteful designs in mahogany and other woods. The whole warranted of the soundest and best manufacture. HEAL AND SON'S ILLUSTRATED CATALOGUE OF BEDSTEADS AND PRICED LIST OF BEDDING sent free by post.—HEAL AND SON, 196, Tottenham Court Road.

BY HER MAJESTY'S ROYAL LETTERS PATENT.

TO AGRICULTURISTS.

B. GREENING AND CO.

BEG to call attention to the Wire Fencing they are now offering at ONE SHILLING PER LINEAL YARD. It is 3 feet 9 inches high, very strong, exceedingly durable, and perfectly efficient, being warranted to turn Horses, Cattle, and Sheep. It is stronger than the common strained Wire Fencing, over which it possesses many considerable advantages. It may be firmly and effectively erected by farm labourers, it requires fewer supports than any other fence, and when fixed, although it is decidedly one of the firmest and most stable fences, yet it does not constitute that impediment to improvement that the strained fence or a hedge does, as it can be removed to another line without the expense of sending for skilled workmen.

Manufactured by Patent Machinery by B. GREENING and Co., Agricultural Iron Works, 1 & 3, Church Gate, Manchester.

N.B. Catalogues, Pattern Sheets, and Price Lists, sent per Post, on receipt of four Stamps (cost of postage).

Printed by WILLIAM BRADBURY, of No. 13, Upper Woburn Place, in the Parish of St. Pancras, and FREDERICK MULLETT EVANS, of No. 22, Tothill Street, in the Parish of St. Margaret and St. John, Westminster, both in the County of Middlesex, Printers, at their Office in Lombard Street, in the Precinct of Whitefriars, in the City of London; and published by them at the Office, No. 5, Charles Street, in the Parish of St. Paul's, Covent Garden, in the said County, where all Advertisements and Communications are to be ADDRESSED TO THE EDITOR.—SATURDAY, April 14, 1855.

Notice is hereby given that the FIRST EXHIBITION of the Season will take place, by permission of her Majesty's Commissioners for the Great Exhibition of 1851, in the GROUNDS of CORE HOUSE, on WEDNESDAY, May 16.

Privileged Tickets at 3*s*. 6*d*. each are now issuing to Fellows of the Society, or their orders, at 21, Regent Street, daily from 11 to 4.

ROYAL BOTANIC SOCIETY, REGENT'S PARK.—The EXHIBITIONS of PLANTS, FLOWERS, and FRUIT this season will take place on WEDNESDAYS, May 9, June 13, and July 4: and of AMERICAN PLANTS, MONDAY, June 18.

Tickets of admission may be obtained at the Gardens only, by orders from Fellows or Members of the Society—price on or before May 5th, 4*s*.; after that day 5*s*. each.

CRYSTAL PALACE.—HORTICULTURAL FETE.—It is intended to hold a grand Horticultural Exhibition at the Palace on SATURDAY, the 2d of June next. The Rules and Schedules of Prizes are now ready, and can be obtained on application to the Secretary.

April 21. (By Order.) G. GROVE, Secretary.

SOUTH LONDON SOCIETY OF AMATEUR FLORISTS.—The FIRST EXHIBITION for this season will take place at the HORNS TAVERN, KENNINGTON, on TUESDAY, 1st May, 1855, when prizes will be awarded for the following productions, viz., AURICULAS, HEARTSEASE, CINERARIAS, and MISCELLANEOUS PLANTS. An efficient Band will be in attendance.—Admission to Non-Members from 2 to 7 o'clock, at Sixpence each. List of Prizes and the Rules for Exhibitors may be had from

JOHN BUSHELL, Hon. Sec., *pro tem.*

Lower Kennington Lane.

ROYAL SOUTH LONDON FLORICULTURAL SOCIETY, under the Patronage of HER MOST GRACIOUS MAJESTY the QUEEN.—The FIRST EXHIBITION of the season will be held at the HORNS TAVERN, KENNINGTON, on THURSDAY, the 2d of May, 1855 (open to all Exhibitors), when prizes will be awarded for the following productions, viz., MISCELLANEOUS PLANTS in collections, SPECIMEN PLANTS, AZALEAS, CINERARIAS, AURICULAS, POLYANTHUSES, and HEARTSEASE, with additional Prizes offered by Members.—Lists of Prizes and the Rules of the Exhibition may be obtained of the Secretary,

JOHN TAYLOR NEVILLE.

Ebenezer House, Peckham, Surrey.

NATIONAL CARNATION AND PICOTEE SOCIETY.

The FIFTH ANNUAL EXHIBITION of this Society will be held at OXFORD, in connexion with the Royal Oxfordshire Horticultural Society, on THURSDAY, the 2d of August, 1855, when the following Prizes will be offered for competition, viz.:—

OPEN TO ALL GROWERS—

CLASS A.—Carnations, 12 dissimilar blooms, 60*s*., 40*s*., 20*s*., 10*s*.
CLASS B.—Picotees (white ground), do. do. 60*s*., 40*s*., 20*s*., 10*s*.

FOR PRIVATE GROWERS—

CLASS C.—Carnations, 12 blooms, to contain not less than nine dissimilar varieties, 60*s*., 50*s*., 40*s*., 30*s*., 25*s*., 20*s*.
CLASS D.—Picotees (white gnd.), do., 60*s*., 50*s*., 40*s*., 30*s*., 25*s*., 20*s*.

[No Exhibitor can win more than one Prize in Classes A. & B., and C. & D., respectively.]

CLASS E.—Single specimens in Classes; on Cards (open to all Growers), five in each class, 5*s*., 4*s*., 3*s*., 2*s*., 1*s*.

Carnations, six Classes: Picotees (white ground) six Classes: Yellow Picotees one Class.

[One variety may win any number of awards in its Class. Seedlings may be shown either in the Stands or Classes, and a First Class Certificate may be awarded to those of sufficient excellence, provided not less than two blooms are shown. Bottles for the single specimens will be provided by the Committee.]

Premier Carnation (to be selected from the Stands or Classes), 7*s*. 6*d*.

Premier Picotee (ditto), 7*s*. 6*d*.

A Schedule of Prizes and Conditions for Exhibition may be had of

WM. R. HOBBS, Secretary.

Subscriptions will be received by Mr. Charles Turner, Royal Nursery, Slough; Mr. John Holland, Middleton, Manchester; Mr. Keynes, Salisbury; John Edwards, Esq., Wace Cottage, Twickenham, Middlesex; Mr. E. S. Dodwell, Derby; or by Mr. W. Ingram, 22, St. Giles's Street, Oxford, to whom all Subscriptions are to be remitted.—Oxford, April, 1855.

BRIGHTON AND SUSSEX FLORICULTURAL AND HORTICULTURAL SOCIETY.—ROYAL PAVILION.—The Second Annual Summer Exhibition of Plants, Flowers, Fruits, &c., will be held on WEDNESDAY and THURSDAY, the 27th and 28th June next, on the same grand scale as last year. Schedules are now ready and can be had by application to E. SPARY, General Superintendent of the Exhibition, or of the Secretary, E. CARPENTER, 45, Lavender Street, Brighton. By the liberality of the Railway Company all plants will be conveyed to the Exhibition and back *carriage free* from all stations on the lines.—By order of the Committee,

EDWARD CARPENTER.

N.B. The Autumn Exhibition will take place on the 12th and 13th September next.

WILLIAM MASTERS AND SON, LANDSCAPE GARDENERS, Exotic Nursery, Canterbury.

WILLIAM BARRATT, LANDSCAPE GARDENER, Wakefield.

*** Plans and Estimates furnished.

SPECIAL CONTRACTS.

SUTTON AND SONS are prepared to make Contracts on very liberal terms to Farmers or others requiring Seeds in considerable quantities.

J. C. WHEELER AND SON'S DESCRIPTIVE PRICED LIST OF GRASSES FOR PERMANENT PASTURE will be forwarded free by post on application.

J. C. WHEELER & SON, Gloucester, Seedsmen to the Gloucestershire Agricultural Society.

NEW AND RARE PLANTS.

MESSRS. VEITCH AND SON respectfully announce that their DESCRIPTIVE LIST OF NOVELTIES for this season is now ready for distribution, and will be forwarded on application.—Nurseries, Exeter and Chelsea, April 21.

T. F. WINSTANLEY'S Second Edition of his DESCRIPTIVE GENERAL CATALOGUE OF SEEDS is now ready, and can be had post free in exchange for two stamps.—28, Market Place, Manchester.

GERMAN FLOWER SEEDS FRESH IMPORTED.

SUTTON AND SONS *have imported a superior assortment of New German Flower Seeds, a Priced List of which may be had post free.*

CEDRUS DEODARA—ONE-YEAR OLD SEEDLINGS.

MAULE AND SONS have a few Thousands of the above to offer at 10*l*. per thousand, strong healthy Plants. They still have a good supply of all sizes from 1 to 5 feet.

The Nurseries, Bristol, April 21.

HYACINTHS.

ARTHUR HENDERSON AND Co.'s Grand Collection of Hyacinths will be in great perfection during the next fortnight, which may be seen. Also the New Scarlet Verbena, Mrs. Woodroffe, at their Nursery, Pine-apple Place, Edgware Road, London.—April 21.

CHOICE PANSIES.

HART AND NICKLIN, FLORISTS, &c., Guildford, offer the following, the set for 12*s*.:—Sovereign, Elegantissima, France, Cycole, Sir J. Paxton, Pandora, National, Criterion, Alfred the Great, Caroline, Sylvia, Sultan, Marchioness of Bath, Eva, Ophir, Mr. Beck, Duke of Perth, British Queen, Euphemia, Adela, Blanche, Royal Purple, Pompey, Lady Carrington, and Lord Jeffrey.—Choice varieties, 4*s*. per dozen.

TO GROWERS OF VERBENAS.

JACOB SCOTT MATTHEWS, SPRING GARDENS, Cardiff, South Wales, begs to inform the Public that his stock of Autumn-struck Verbenas are now ready for sending out, consisting of 30 of the best Bedding varieties, fine Plants and well established in pots. Retail price, 1 doz., 3*s*.; 4 doz., 10*s*.; 9 doz., 20*s*. The usual allowance to the Trade.

NEW SCARLET VERBENA.—MRS. WOODROFFE.

ARTHUR HENDERSON AND CO. are now sending out this fine new VERBENA; particulars of which may be seen in their advertisement in the *Gardeners' Chronicle* of March 31. The usual discount to the Trade.

☞ This Verbena is the same as "Conqueror," one offered by another firm.—Pine-apple Place, Edgware Road, London.

HOLLYHOCKS.

A. PAUL AND SON have for Sale a large Stock of fine double HOLLYHOCKS in separate colours, 30*s*. to 50*s*. per 100. Superior named varieties, 12*s*. per doz. and upwards. The plants are strong and in perfect health.

Nurseries, Cheshunt, Herts.

OSAGE ORANGE (MACLURA AURANTIACA).

CHARLWOOD AND CUMMINS can supply SEED of the above-named Hedge Plant at 4*s*. per lb., with full directions for treatment. The month of May is the best time for sowing.—14, Tavistock Row, Covent Garden, London.

BOSSOM'S CHAMPION OF ENGLAND CELERY.

THE finest Celery yet introduced, beautifully white, very crisp and solid, and withstands a greater amount of frost than any other known variety; it has been blanched in the ground 3 feet.—To be obtained of T. F. WINSTANLEY, Seedsman, 28, Market Place, Manchester, price 2*s*. 6*d*. per packet; prices to the trade on application.

MAY'S MAGNUM BONUM LETTUCE is by far the largest, sweetest, and crispest Lettuce known, in proof of which we possess numerous letters received from parties who had it last season. The addresses of the writers can be had on application. Only a few packets remaining at 1*s*. each.—HENRY MAY, the Hope Nurseries, near Bedale, Yorkshire.

BANKS' SEEDLING FUCHSIAS.—1855.

(FOR FULL DESCRIPTION SEE FORMER ADVERTISEMENTS, AND ON APPLICATION).

W. J. EPPS has much pleasure in stating that the above Fuchsias have been proved to be the finest that have been raised by that celebrated grower E. Banks, Esq., Deal. Early orders are solicited. The set of six, 2*l*. 2*s*. The usual discount to the trade.—Bower Nurseries, Maidstone.

CABBAGE PLANTS.

THOMAS WELLAND offers genuine Garden and Field Cabbage Plants, safely packed for any part of Great Britain. Packed and delivered free to Godalming Station, 8*s*. 6*d*. per 1000.—Surrey Gardens, Godalming, Surrey.

500,000 FLAT-POLE OR DRUM-HEAD CABBAGE PLANTS.

THOMAS MOORE, NURSERY AND SEEDSMAN, Fore Street, Kingsbridge, Devon, begs to call attention to his large Stock of CABBAGE PLANTS, which will be ready in May and June. They are a superior late sort, and raised from seed of his own saving.

"NORFOLK HERO" CUCUMBER.—Without exception the very best Cucumber for open ground cultivation that has yet been offered. It is a most prolific bearer, as handsome as any frame variety, the fruit measuring from 16 to 20 inches in length. It is in the sole possession of YOUELL & Co., who will forward per post free (on receipt of postage stamps) packets containing six Seeds, 1*s*.; 18 Seeds, 2*s*. 6*d*.

To Market Gardeners the above will be found a great acquisition.

Royal Nursery, Great Yarmouth.

SPLENDID NEW HOLLYHOCKS.

G. SMITH respectfully informs the admirers of the HOLLYHOCK that the following are Seedlings of great merit, and cannot fail to give entire satisfaction. They were raised by Mr. Parsons, the grower of Jean of Arc, and other fine varieties. To be sent out about the middle of April, 1855, in strong healthy plants.

	s.	d.
Eclat, yellow and buff, a nice full flower	3	6
King of Yellows, large, of fine form, flower full, extra fine yellow	7	6
Marchioness, flesh or blush, very double and close, fine for exhibition	3	6
Monarch, a true salmon, very large and fine shape ...	7	6
Mr. Adams, dark salmon pink, a noble show flower ...	5	0
Pearl, blush white, large and distinct	5	0
Pillar of Roses, a beautiful bright rose, a splendid spike, the finest border flower yet offered, and a most attractive show flower	5	0
The Alma, cherry rose, distinct, fine shape	5	0
White Unique, very close and double	3	6
Sarah, a splendid large rose, fine form and spike	5	0

Tollington Nursery, Hornsey Road, Islington, London.

FLOWER SEEDS.—We have selected out of our large collection of Flower Seeds the most beautiful and showy varieties, each sort distinct in colour, and calculated to produce a fine effect when planted out in beds or groups in the flower border. We have had each variety distinctly marked with the Botanical and English name, height, time of flowering, colour of the flower, manner of growing, whether erect or trailing, &c., the time it should be sown, and other valuable hints as to its cultivation. In selecting these varieties we have been careful to exclude all which are shy bloomers or have an insignificant appearance, so that the collections will comprise only those which are really showy and handsome, and which we believe would prove to the entire satisfaction of any lady or gentleman who might be disposed to order them. The German Stocks and Asters especially are most superb. The Collections will be sent free by post to any part of the kingdom at the following prices:—

20 extra fine varieties, all distinct and beautiful	...		5s. 0d.
50 do.	do.	...	10s. 6d.
100 do.	do.	...	20s. 0d.

J. C. Wheeler & Son, Nurserymen and Seed Growers, Gloucester, Seedsmen to the Gloucestershire Agricultural Society.

Established in the early part of the 18th Century.

NEW PLANTS IN FLOWER.

MESSRS. E. G. HENDERSON AND SON beg to announce that the following plants are now in flower, and may be viewed at their nursery:—

Camellia Jenny Lind	Azalea Criterion
" Marie Antoinette	" Juliana
" Ariosto	Rhododendron campylocarpum
" Mathotiana	" Dalhousie will be open in the course of a week
" alba pleno of Casoretti	Rhododendron Pontica coccinea
" alba illustrata	Camellia de la Reine
" Catherine Longhi	Azalea Admiration
" Comte de Paris	" Narcissiflora
" Don Michel	Cyclamen Persicum, new collection
" Innocenza	Rhododendron, new seedling
" Madonna	Genestyllis macrostegia (Fuchsioides).
" Ristori	
" Verschaffeltiana	

NEW PLANTS

To be sent out in May (orders for the Fuchsias received after April 7th will only be executed after the earlier orders are sent off, when it is probable one or two varieties may be too small to travel with the rest):—

HYDRANGEA HORTENSIS, flore pleno, 10s. 6d.

PHLOX QUEEN VICTORIA, 5s.

DAHLIA EMPEROR FRANCIS JOSEPH (variegated foliage), 10s. 6d.

SHRUBBY BEDDING CALCEOLARIAS.

Brunette	7s. 6d.	Norma	7s. 6d.
Coreggio	7 6	Red Rover	7 6
Maggiore	7 6	Vezzosa	7 6
Minnie...	7 6	Wildfire	7 6

Or the set of eight varieties, 2l. 2s.

With the permission of Mr. C. Turner they will offer his new CALCEOLARIA PURITY (the best white bedding variety) at 7s. 6d. each, or with the above set, 2l. 7s.

FUCHSIAS.

Queen Victoria (Story)	10s. 6d.	Lady of the Lake (Story)	10s. 6d.
Prince Albert (Banks) ...	10 6	Water Nymph (Story) ...	10 6
Perrugino (Story)	10 6	Raffaelle (Story)	10 6
Empress Eugenie (Story)	10 6	Mrs. Story (Story)	10 6
Ranunculæflora (Story)...	21 0	Snowdrop (Story)	10 6

Or the set of ten varieties, 4l. 4s.; or without Ranunculæflora, 3l. 3s.

FUCHSIA BANKS' FAVOURITE (Banks), 10s. 6d.

For full particulars of the above see back numbers of this Paper.

NEW SEED CATALOGUE,

With full description of all the New Annuals, forwarded post free on application; each article is priced, the height and colour given, with various information to guide the cultivator. A list of the choicest sorts is also selected and brought together in a separate List.

THE NEW SPRING CATALOGUE

Will shortly be published and forwarded post free on application. Parties wishing for the same will have their names booked for it, to be sent as soon as ready.

A COLOURED PLATE.

Composed of a group of Nine new Flowers belonging to the Stove, Greenhouse, and Garden. It will be sufficient to say that Mr. Andrews, the eminent floricultural artist, has them in course of preparation, and under his superintendence full reliance may be placed on their accuracy; any one wishing for the same will have their names booked for it, to be sent them when finished, by forwarding 12 postage stamps; and if ordered in time will be stitched-in and sent with their new Spring Catalogue. This notice also applies to any nurseryman that may wish to have the Plate.

Messrs. E. G. Henderson & Son having purchased of the late W. Story, Esq., of Newton, in the county of Devon, for ONE HUNDRED GUINEAS, all Seedling Fuchsias with white Corollas, a new feature in this tribe introduced by him, and in consequence of an advertisement appearing in the *Gardeners' Chronicle* from Messrs. Lucombe, Pince, & Co., of Exeter, offering two new Fuchsias similar in character to those purchased of the late Mr. Story, it was thought necessary, after a written communication with that gentleman, for one of the firm to make further inquiries about them, and in consequence Mr. Andrew Henderson went to Exeter and Newton, where he was informed by a jobbing gardener at Newton that he had received in the month of November last Seven Pounds for them, after (as the said jobbing gardener stated) he had been offered 420 pounds by a nurseryman in London, but whose name or address he did not know.

Messrs. E. G. H. & Son give the above explanation in consequence of many of their customers having ordered plants at higher prices than are now asked. This reduction is made in consequence of information which they have received that leaves no doubt in their minds but that those to be sent out by Messrs. Lucombe, Pince, & Co. are similar in character to those purchased of Mr. Story.

HENDERSON

TO THE TRADE.—*The Subscribers can supply the following* AGRICULTURAL SEEDS *to the Trade. Prices on application.*

White Belgian Carrot.
Yellow Globe Mangold Wurzel.

Goods carriage free (not under 20s.), to all the London termini, and all stations on the London and Norwich Colchester Line. Plants added gratis with orders of 40s. and upwards.

COMPLETE CATALOGUES on application for six penny stamps, or the Spring Catalogues alone for three penny stamps, or gratis to our customers who may not have received them.

Seed and Horticultural Establishment, Sudbury, Suffolk.

BEDDING PLANTS.—At 2s. 6d. per Doz.

JOHN SCOTT, Merriott Nurseries, Crewkerne, Somerset (established 1728), has nearly 20,000, in 3-inch pots, ready to be sent out. Post-office Orders payable at Crewkerne. (Baskets and Package at the Expense of Purchaser, and returnable.)

200 Sorts of the best and newest Verbenas.
120 do. Scarlet and other Bedding Geraniums.
20 do. Variegated leaved ditto.
100 do. Fuchsia, all the best; 24 do. Shrubby Calceolaria, 24 do. Petunias; with Anagallis, Ageratums, Cupheas, Heliotropes, Lobelias, Salvias, Senecios, &c. Also the beautiful variety, Double Pyrethrum.

When a fair proportion of each is taken the price will be 2s. 6d. per dozen; but if only Calceolarias and Geraniums are ordered they will be 4s. per dozen. Catalogues, in which the above are arranged in sections of colour, &c., sent on receipt of a postage stamp. Parties requiring large quantities can have them in store pots by agreement.

NEW AND CHEAP PLANTS.

The Cheapest Establishment in the Kingdom for Plants is at

HENRY WALTON'S, Edge End, Marsden, near Burnley, Lancashire, where there are propagated annually from 20,000 to 30,000 plants for sale, which for cheapness and quality are not to be equalled. Parties desirous of possessing a choice collection of good plants would do well to select from the following:—

GERANIUMS, new varieties, strong autumn-rooted plants, purchasers selection, 30s. per dozen; H. W.'s selection, 25s. per dozen, viz.—Attraction, Carlos, Duchess of Wellington, Empress, Eliza, Glowworm, Helen, Indian Chief, Leah, Lucy, Mrs. Hoyle, Marginata, Mary, Neatness, Picta, Rebecca, Regalis, Rosa (Foster's), Rhoda, Tamberlik, Virginia, and Zeno. Extra strong choice older varieties, 9s., 12s., and 15s. per dozen: 25 for 20s.; 50 for 35s.

FUCHSIAS, new varieties of last season, spring struck, 7s. 6d. per dozen; autumn struck, 9s. per dozen, post free, viz.—Admiral, Autocrat, Clio, Duke of Wellington, Elegans, Fenny Webb, Grandissima, Globosa Splendens, Henry Monteith, Macbeth, Magnifica, Monarch, Mr. Charles Palmer, Omega, Queen of Hanover, Telegraph, Trentham, and Vanguard.

CINERARIAS, choice new varieties, 12s. per dozen, or 6 for 8s., viz.—Advancer, Etoile de Vaise, Estelle, Empress Eugenie, Exquisite, Garland, Lady Camoys, Lord Stamford, Lablache, Mrs. Seagrave, Mrs. Beecher Stowe, Novelty, National, and Polyanthiflora. Choice varieties of previous years, 6s. and 9s. per dozen.

PANSIES, the following choice select varieties, 12s. per dozen, or the set of 22 for 18s.—Duke of Perth, Eldorado, Flower of the Day, Golden Eagle, Kate, St. Andrew, Sovereign, Emperor, Fearless, Lord Walsingham, Ajax, Owen Glendower, Prince Albert, Rubens, Rising Sun, Sir William Wallace, Lady Bute, Miss Jane, Mrs. Oswald, Marchioness of Bath, Yellow Climax, and Charles Turner. Good older show varieties for 4s. 6d. and 6s. per dozen.

VERBENAS, new varieties of last season, 7s. 6d. per dozen.

New PETUNIAS of last season, 9s. per dozen.

CARNATIONS and PICOTEES, 50 superior sorts, named, one pair of each, 2l.; 25 do., one pair of each, 1l.; or 9s., 12s., and 18s. per dozen pairs.

PINKS, 4s. 6d., 6s., 9s., 12s., and 18s. per dozen pairs.

HOLLYHOCKS, a choice selection of strong healthy plants, 12s., 18s., 24s., and 30s. per dozen, H. W.'s selection.

DAHLIAS, in May, new varieties of last season, 9s. and 12s. per dozen; older varieties 4s. 6d. to 6s.

A choice selection of Bedding Plants, including Scarlet and other Geraniums, Heliotropes, Pentstemons, Cupheas, Salvias, &c., equally cheap.

H. W.'s Spring List is now ready, and may be had for one postage stamp.

It is respectfully requested that all Post Office Orders be made payable at Marsden, Lancashire; and a remittance or satisfactory reference expected with all orders from unknown correspondents. All orders to the amount of 25s., carriage free to Liverpool, Manchester, Leeds, and Preston; 2l. and upwards, carriage free to Birmingham and Carlisle; for more distant carriage extra plants will be given gratis.

GEORGE SMITH has much pleasure in offering the undermentioned strong Plants, which he is now sending out, and feels great confidence in recommending them as possessing first-rate qualities:—

VERBENAS.

BOULE DE FEU (Young), bright orange scarlet, with conspicuous lemon eye; pip large, of fine form, compact truss, of good size, the habit excellent, a most profuse bloomer, the finest scarlet ever offered. First class certificates at the National, Royal South London and North London Floricultural Societies.

LORD RAGLAN (Banks), crimson scarlet, large lemon eye, pip and truss large, of fine form. This will be found a noble variety.

EMPRESS (Smith), pure white, with conspicuous rosy purple centre, pip and truss large, smooth and compact. One of the very finest of the light varieties.

MRS. M'NIEL (Smith), brilliant rose with large lemon eye, truss and pip large, of exquisite form, and very beautiful. In the style of Beauty of Hornsey.

VIOLACEA (Smith), intense violet, with a very conspicuous large white eye, pip and truss large, of good form. This will be found most remarkable and beautiful, either for bedding or exhibition. It is something in the way of M. Paquin, with colour much more intense, and a fine free grower.

SILISTRIA (Smith), pale lilac, shaded with rose, very fine and compact. First class at the Royal South London Horticultural Society. The set of six for 24s., or 5s. per plant.

FUCHSIAS.

The following four Fuchsias are fine show flowers, plants of good growth, and very free blooming kinds that must be grown in all good collections:—

OMER PASHA (Smith), tube short and stout, sepals well reflexed, of bright waxy crimson scarlet, corolla deep violet purple, large, of good shape, fine habit, free in growth and profuse bloomer. A fine plant for exhibition. 7s. 6d.

ORLANDO (Smith), dark tube and sepals reflexed, with an intense dark corolla. 3s. 6d.

CORONET (Smith), white tube and sepals, corolla violet-purple, shape, very free. 3s. 6d.

NIMROD (Smith), white tube and sepals, corolla light purple, good form. Plant of strong growth, and a very free bloomer. 3s. 6d.

SCARLET GERANIUMS.

BEAUTY OF COMB BANK, intense scarlet, eye white, pip large and circular, truss very large, dwarf habit, with luxuriant foliage. A first class bedding variety. 5s.

CHEPSTEAD BEAUTY, fiery crimson scarlet, extra large and fine, foliage very beautiful, habit dwarf, and free bloomer. One of the finest scarlet Geraniums ever offered. 5s.

CERITO, salmon rose, truss and pip large. A novel and pleasing variety. Was exhibited at the National Floricultural Society, where the judges would have awarded it a first class certificate had the plant been exhibited. 5s.

PETUNIA.

SINGULARITY (Smith), a novel and striking variety, corolla two-thirds downward bright green, throat rose, flower extra large, the habit of Prince Albert, a pleasing variety. 5s.

Choice Verbena Seed, 2s. 6d. per packet.

A Priced and Descriptive Catalogue of first-class Verbenas, Geraniums, Fuchsias, Hollyhocks, Dahlias, Chrysanthemums, and Petunias, will be forwarded in exchange for one stamp.

Tollington Nursery, Hornsey Road, Islington, London.

VARIEGATED IPOMŒA.

GEORGE ROBERTS has just received from a correspondent a small packet of the seed of a Variegated IPOMŒA, which appears from the following description to be a very interesting novelty. "Apparently a beautiful hybrid. The ground colour of the flower is white or pale pink, profusely spotted and streaked with purple, blue, lilac, bright crimson, &c. The same plant presents an almost infinite variety of colours, each flower varying from its neighbour on the same stalk: in one the purple, in another the blue stripes would be more prominent." Packets containing 10 seeds 2*s.* 6*d.*

GEORGE ROBERTS begs also to offer to the Trade the following Seeds:—Quisqualis indica, Q. hirsuta, Galphimia elegans, Canna lutea, C. indica, Aristolochia odoratissima, Cæsalpinia sepiaria, Mimosa aspirata or Shrubby Sensitive, Momordica Luffa, Ipomœa rubro cærulea, I. bona nox, a fragrant white Convolvulus, and Argemoni mexicana.—32, Moorgate Street, London.

A. STANSFIELD AND SON beg to offer the following:—

1000 species and varieties of Herbaceous and Alpine Plants at 4*s.* per dozen, or 30*s.* per 100.

500 species and varieties adapted for Rockwork at 4*s.* per dozen.

200 species and varieties of Hardy Greenhouse and Stove Ferns and Lycopods, at from 6*s.* per dozen, and upwards.

Verbenas, Fuchsias, Geraniums, and other Bedding Plants, at from 3*s.* 6*d.* per dozen. Catalogues on application.

*** 100 bushels of selected Fluke Potatoes at 4*s.* 6*d.* per bushel of 56 lbs. Dean's Seedling Fluke at 3*s.* 6*d.* per stone of 14 lbs.

Vale Gardens, Todmorden, Lancashire.—April 21.

NEW ROSES.

MESSRS. WILLIAM ROLLISSON AND SONS beg to offer the following new Roses, which they will be able to supply in good healthy plants the first week in May, at 7*s.* 6*d.* established in pots. Purchasers wishing for a less number than here enumerated, by leaving the selection to ourselves, may depend upon having the best and most desirable varieties chosen for them.

HYBRID PERPETUALS.

Abadie de Rougemont, bright crimson, very fine.
Baron Larray, fine rose, and beautiful shape.
Belle Lyonnaise, very double, blush white.

N.B.—Other names will shortly appear, as the agents are appointed.

TO WHEAT GROWERS.

PETER LAWSON AND SON, the QUEEN'S SEEDSMEN, Edinburgh and London, have received from North-West America a small quantity of two new kinds of WHEAT, which they are sending out in packets containing 200 grains. One kind is named Club-headed, cultivated by the old Californians. The yield is said to be very large, and forms a very beautiful delicate-coloured sample. Price 20*s.* per packet, containing 200 seeds.

The other kind is evidently a variety of Triticum durum, with solid stalks. It is very early, and well adapted for spring sowing. Price 15*s.* per packet, containing 200 seeds.—Orders may be sent to PETER LAWSON & SON, in Edinburgh; or direct to their London House, 27, Great George Street, Westminster.

GRASS SEEDS.—CARRIAGE FREE.

PERMANENT PASTURE GRASS.—*The very best Selections can be obtained from* WILLIAM E. RENDLE & CO., *Seed Merchants, Plymouth,—all new and carefully selected, from* 24*s.* *to* 30*s.* *per acre.*

ORNAMENTAL LAWNS, PLEASURE GROUNDS, &c. The choicest varieties for producing a fine sward for Lawns and Pleasure Grounds can be procured from WILLIAM E. RENDLE & CO., Seed Merchants, Plymouth, at 18*s.* per bushel, 2*s.* 6*d.* per gallon, or 1*s.* per lb.

RENOVATING GRASSES—for sowing over land deficient of plant—can be obtained at 9*d.* per lb.

A complete descriptive List of Grasses will be found in "RENDLE'S FARMING PRICE CURRENT," *and some valuable Tables, and other information relative to the best varieties for certain Lands and Situations.*

Apply to WM. E. RENDLE & CO., Seed Merchants, Plymouth.

ESTABLISHED SEVENTY YEARS.

YOUELL AND CO., Royal Nursery, Great Yarmouth.

SUPERB HOLLYHOCKS, SEEDS, ETC.

WILLIAM CHATER begs to offer packets of seed, consisting of 20 varieties, from his best Show Hollyhocks, at 5*s.*; 12 varieties, 2*s.* 6*d.*; and from good double sorts, 1*s.*

Superior Quilled German and French Asters, in 12 varieties, mixed, 1*s.* per packet; separate, 2*s.* Fine Quilled African Marigolds, 6*d.* per packet.—Saffron Walden Nurseries.

SUPERIOR WHITE BELGIAN CARROT SEED.

SUTTON AND SONS have some remarkably fine seed of this useful root. Whereas much of the Carrot Seed selling this season is acknowledged to be of inferior quality, Messrs. SUTTON & SONS having tested theirs, find it to germinate as well or better than any they have ever sold. Price according to quantity required.—Address SUTTON & SONS, Seed Growers, Reading, Berks.

To Farmers, Potato Growers, and Others.

JACKSON'S PATENT PREPARATION

FOR

PRESERVING POTATOES, WHEAT, AND OTHER SEEDS

From DISEASE, the RAVAGES of the SLUG, GRUB, and WIREWORM, in addition to which the CROPS are brought forward in HEALTH AND VIGOUR, and the yield is greatly increased, in proof of which the following extracts are given from numerous letters received by Mr. JACKSON.

EXTRACTS:—

"One of the fields of this farm, the property of MRS. STANBURY, was planted with Regents Potatoes in April last, some of which were prepared by you. The result now is, that the whole of the crop from the unprepared sets is thoroughly diseased, and hardly worth the trouble of taking up; while those raised by the side of them from the prepared sets are not only in a beautiful state of preservation from the disease, but the produce is much greater,—the Potatoes are more numerous than the others; indeed, if there were no such thing as the disease to be feared, it would be worth the trouble and expense of preparing the sets by your process, even for the sake of the improved crops. I shall certainly, for the future, prepare all my Potatoes for seed by your process; and I intend to adopt it for preserving my Wheat from the Smut.

"G. B. BAXTER.

"Belmont Farm, Eltham, Kent, August 28, 1854."

"Admiral Sir J. A. GORDON, K.C.B., Marlee House, Blairgowrie.

"SIR,—I have received your note of the 16th. The Potatoes that came here from England, prepared by Mr. JACKSON, were planted in a piece of new ground, and according to the directions sent by him along with them as to distance between the plants, &c. They came up well, with strong healthy stems; we have now taken the whole crop up, and there is not the slightest appearance of any disease amongst them. They are of large equal size and very prolific. There were long black unprepared Kidneys planted in the same patch, and a great deal of them are not fit for use, at least a third part are diseased. I hope Mr. JACKSON's process may be widely known, as it is a great boon.—I am, &c.,

JOHN SHANKS,

"Forester, Kildrummy Castle.

"Kildrummy Castle, Aberdeenshire, November 17, 1854."

"I am very much pleased with the result of the experiments I have made with your Prepared Potatoes; for I planted them, without any manure, in ground where for several years I have hardly had a sound Potato, and I now find the crop perfectly free from disease, and in a very fine condition; while those of the same sort, unprepared, which were planted at the same time, and next to them, are diseased and eaten by worms.

"The Potatoes from the Prepared Seed were so remarkably good that I was induced to weigh them, and I found, to my great astonishment, that they were as 200 to 150 of the others, or about 25 per cent. in favour of your preparation.

"T. AUSTEN, Nurseryman and Seedsman.

"Blackheath, Kent, 24th August, 1854."

Sold by Messrs. CHARLWOOD & CUMMINS, Seedsmen, Covent Garden; and JOHN KERNAN, Seedsman, 4, Great Russell Street, Covent Garden; all Seedsmen and Chemists; and at the Patentee's, 18, Cannon Street, London Bridge, in Packets of One, Two, Three or Four Pounds, or in Bulk for the use of Farmers and Potato Growers.

The Gardeners' Chronicle.

SATURDAY, APRIL 21, 1855.

IN our columns of the 23d Dec. last we announced the very interesting fact that the MANGOSTEEN had at last produced its flowers in England, in the garden of his Grace the Duke of Northumberland. We can now add that the fruit has ripened—one having fallen from the tree last Monday, after acquiring the size of a St. Michael's Orange. It was of a deep plum colour, and upon being opened was found perfect in every respect except the formation of seeds, of which there was no trace. Its flavour proved equal to the great reputation which the Mangosteen enjoys; we thought it something like that of a melting Peach mixed with Grape juice; at all events there can be no doubt that it must rank even in England as the King of the dessert. Three other specimens are nearly ripe, one of which promises to be fully as large as if grown in the Malay Archipelago. It must be highly

gratifying to the Noble Duke to find that the patient care which has been bestowed upon the plant is at last, after so many years, thus rewarded by complete success.

We believe that the garden at Syon is the only establishment, private or public, in Europe in which have been ripened Vanilla, Nutmegs, Litchis, Cloves, and, greatest of all, the Mangosteen.

We find in the Prussian *Landwirthschaftliche Zeitung*, of March 9, the following highly interesting tabular view of the mean monthly earth temperature of Berlin, drawn up by Professor Dr. Dove from the observations of the last five years; for the convenience of our readers, we have reduced it from the scale of Réaumur to that of Fahrenheit.

To adopt the words of the German editor, the importance of air-temperature with relation to the vegetation of plants, and their cultivation, is so universally recognised, that it is superfluous to waste words upon it. But the influence on the development of the plant, exercised by the relation borne by the warmth of the soil to that of the outer air, is less known, although practically admitted, inasmuch as it teaches us to sow different plants at different times of the year.

It is only, indeed, from a very recent period that even meteorologists have begun to ascertain the varying temperature of that soil in which the roots of plants are placed, and which governs their rate of growth at least as much as any other of the conditions to which vegetation is exposed.

To say, as was formerly said, that the average ground temperature of a country amounts to so much, as is indicated by springs, was wholly without signification to a cultivator, whatever interest the statement may have had in the eyes of a geologist. Springs indicate the temperature of their sources, and little else; and as the roots of plants do not reach the neighbourhood of such springs, to them the warmth of sources is indifferent. When artesian wells were bored in the valley of the Thames, the water rising from the depth of 200 or 300 feet was always warm; unless our memory deceives us, the temperature was somewhere about 66°, both in midwinter and at midsummer. But the vegetation of neither season could be affected by such a fact.

It was the deficiency of information upon this important subject which led to the long series of observations on ground temperature which have been carried on in the Horticultural Society's garden since 1838, and which have since been the subject of inquiry in other countries. Angström at Upsal, Weilbach at Copenhagen, Taylor on the Neilgherries, Hooker at Dorjiling, Captain Newbold at Bellary, and Caldecott at Trevandrum, have all published observations, more or less complete, which tend to illustrate this department of knowledge, and Professor Dove's new contribution is a most welcome addition. What the more important inferences are to which the experiments now on record lead, need not be here examined. For to-day we confine ourselves to asking whether the cause of the present singularly late season is explained by ascertained facts. That it is most unusually late is shown by the circumstance that the common Pilewort (Ranunculus ficaria), which near London usually opens its first flowers in the very beginning of March, was not this year to be found in blossom till the 15th April, six weeks after it was due.

The average ground temperature of Chiswick this year has been, at 1 foot and 2 feet below the surface, as follows:—

In February	35°.25 and 38°
In March	38°.75 and 39°.50
In April (to the 12th)	43°.38 and 43°.12

whereas, on an average of 10 years, it has been found to be—

In February	39°.74 and 40°.51
In March	40°.96 and 41°.57

February being 4¼° and 2¼°, and March about 2¼° and 2° below the average—an enormous difference, when it is considered how much the roots of plants are affected by small differences in temperature. In fact, our February has been little warmer underground than Berlin in January.

If we contrast the three first years in which careful observations were made at Chiswick with this year, it will be evident enough how much the balance is against 1855.

	1838.		1839.		1840.		1855.	
	1 foot	2 feet	1 foot	2 feet	1 foot	2 feet	1 foot	2 feet
Feb.	33.98	35.66	40.20	40.96	40.57	41.86	35°.25	38°
Mar.	41.48	41.46	41.46	41.93	39.24	41.71	38°.75	39°.50

In the year 1846, February averaged 43.23° and 44.07°, while March advanced still further, the thermometers indicating 44.47° and 45°.55.

One practical lesson to be drawn from these important facts is that seeds which might have been safely sown in February, 1846, ought not this year to be committed to the ground till April, and that nothing except the hardiest kinds can this year be safely sown before the end of the month. For until the earth at 1 foot below the surface reaches the temperature of 46°, a great part of the flower seeds which are regarded as hardy cannot be ensured from rotting, especially in the presence of wet weather. Physiologists know that seeds have their own specific vitality. The seed of the Nettle will not germinate at a temperature sufficient for Groundsel, nor the Cape Marigold in the temperature that suits the Nettle, nor the Cocoa-nut in that which is sufficient for Cape Marigold. Horticultural observations are wanting to show what is the exact temperature of the soil which different plants require; but we think ourselves justified, by what *is* known, in asserting that exotic annual seeds should not be put into the earth till our weekly records of temperature show that the ground has reached 46°.

It is to the neglect of this, and not to the quality of seed, as is always asserted, that those failures of annuals, of which we hear so much, should be ascribed. Seeds in fact, in nine cases in ten, do not fail because they are bad, but because they fall into the hands of bad managers.

The Cucumber Disease is already as active as it was last year, as baffling to the cultivator, and as obscure in its origin. All that we know is that from an early stage of growth parts of the cellular tissue are destitute of their proper vitality, chlorophyll is not formed, the cells are gorged with fluid, or give way under the first burning heat, and ultimately decay or deformity are the consequences. Great attention will sometimes palliate the evil; but we have never seen a plant which has been once seriously affected recover. Foreign seed unfortunately produces plants quite as unhealthy as our own, and we can suggest only one remedy, which, indeed, we have suggested before. Have recourse to the oldest seed which can be procured, and from this save the healthiest plants, for the sake of producing, if possible, a healthy stock. Reject every plant that shows the slightest tendency to sickliness or deformity, and allow all the best fruit to ripen. A stock may thus be saved which will supply every want for years to come; and if the experiment answers, it will be easy, with a little attention, to keep it up. If the produce, however, should still prove diseased, provided the seed is old enough to remove any suspicion of its being itself tainted with the malady—which is, we believe, of very recent origin—we shall then have simply to submit to an evil which does not admit of remedy, and conclude that there must be some atmospheric cause at work which we can neither discover nor control. *M. J. B.*

VEGETABLE PATHOLOGY.—LXVIII.

299. Chlorosis.—This term has been long in use to designate that condition of vegetables in which those parts which, under the influence of light, are normally of a healthy green, varying in tint according to the several species, though still properly illuminated, exhibit a pale yellowish tint with only a very slight admixture of blue. The name is evidently given from a supposed analogy between the affection known to physicians by the same denomination and that to which plants are subject, but inasmuch as it rather indicates an accession than a diminution of the green tint it has been supposed to be not strictly correct, and the word Pallor has been substituted by some. As the term is, however, well understood to indicate this peculiar condition, it seems scarcely worth while to change it, and the less so since χλωρότης is used by Hippocrates in the sense of paleness. The word Icterus has been proposed for those cases which are not constitutional, but the term appears unnecessary, and I know of no advantage that can arise from its adoption. It is properly only a synonym of Chlorosis.

300. It was shown above (297) that a green tint is not absolutely necessary to the health of every vegetable, and instances were adduced in proof. In general, however, any marked departure from the normal green, except it is simply transitional, is attended with more or less of danger. There is, however, a great difference between the diseased condition of which we are treating and mere blanching. Shoots which are produced in the absence of light seldom exhibit any tint of green, and the same may be said of the cotyledonal leaves of seeds before the integuments by which they are inclosed are ruptured. In these cases, however, the admission of light soon imparts their normal colour, and they are in the end as healthy as if they had been produced at once under the full influence of the most favourable atmospheric conditions. But this is not the case with Chlorosis. Exposure to light, so far from remedying the evil, sometimes almost aggravates it, because the tissues of the affected parts are in such a low state of vitality as not to be capable of bearing the stimulus, and unless this condition can be raised by the application of external remedies, such as gases arising from fermenting manure, a more generous diet, or weak solution of sulphate of iron, there is no hope of their returning to a sound condition. An exception, too, should be made where the evil has not existed too long, and become inveterate, in favour of the benefit to be derived from the removal of the primary cause, as, for instance, where bad draining, cold winds, or any other outward agent have produced a chlorotic condition of the tissues. Where it is purely constitutional, it is the most unmanageable of all disorders. In cases where outward agents are at work, if the older parts are sacrificed, the more recent produced under more congenial circumstances may be altogether unaffected, as we see every year in Wheat crops, Vines, &c.; but where the constitution is affected, the new parts will be affected as well as the old; and though there may be nothing present to aggravate the evil, it may be in itself so virulent as to admit of no palliation.

301. From whatever cause Chlorosis may arise, the effect is much the same upon the plant itself, though according to the peculiar circumstances of each species it may be slightly different. A portion of the plant, greater or less, according to circumstances, does not assume its natural green hue, but acquires instead a yellow tint. This spreads to neighbouring tissues or remains isolated. No chlorophyll is formed; the walls of the cells become flaccid; their contents undergo chemical change; and the whole either dries up, leaving additional work to be done by those tissues which remain healthy, or the walls give way, decomposition takes place, the putrefying mass spreads its contagion in every direction, and the neighbouring structures are involved. Where the tissues dry up, the effect may be slower, but it may not be less sure, and every part of the plant is liable to be affected; and even the tissues of the seed, if any should be produced, may be unhealthy, and capable of carrying on the evil through succeeding generations: and thus, what was at first accidental may eventually become constitutional or hereditary.

302. We will first notice such instances as may be deemed to be constitutional. These, indeed, may have arisen in remote external causes; but inasmuch as we are not in a position to ascertain what these are, and the plant—either from seed or otherwise, without any assignable reason—exhibits such phenomena, we are compelled to regard them as constitutional. As certain plants from their very infancy appear variegated, or others are chlorotic, and baffle every attempt to raise them to a healthy condition. A few scattered seedlings will be found in almost every patch consisting of numerous individuals which are in this state. But not only is this true of individuals where the majority of seedlings is healthy, but some varieties, especially hybrids, are by nature so delicate as scarcely to admit of cultivation. Mr. Herbert found this to be the case in his experiments on the muling of Rhododendron and its allies; and, indeed, it is notorious that some varieties of fruits are far more difficult of management than others, because they have such a tendency to assume a chlorotic condition. It is not merely that they are less impatient of wet and cold, but that in their own nature they are possessed of such a low degree of vitality as sometimes, under circumstances apparently not unfavourable, to defy the utmost pains and skill which can be brought to bear upon them. *M. J. B.*

ON THE EFFECTS PRODUCED BY THE FROSTS OF FEBRUARY, 1855, IN THE ROYAL DUBLIN SOCIETY'S GARDEN, GLASNEVIN.

BEING A PAPER READ BY D. MOORE, ESQ., AT THE EVENING MEETING OF THE ROYAL DUBLIN SOCIETY, ON FRIDAY, MARCH 30, 1855.

In furnishing details of the effects produced on out-door plants by the late severe frosts in the Botanic Garden, I shall first make a few remarks on the climatology of Ireland, as well as on relative climatology in several parts of Europe, in so far as plants are affected by it.

First, with respect to Ireland, I believe I am right in stating, that in no other country of equal superficial area will so many exotic plants, natives of the different temperate climates of the globe, be found flourishing with equal luxuriance as there are in Ireland. The green grassy sward of Erin, and the fine evergreen shrubs, are more admired by the majority of foreigners who visit us than almost anything else they see. The audible exclamations "très bien!" "très magnifique!" which one hears uttered by them when passing some fine Arbutus, Laurustine, or even Portugal Laurel, proves how much their attentions are arrested by the beauty of those plants as they appear here, con-

pared with the miserably stunted specimens of them seen on the continent, where they are treated as hot-house plants. The observation applies chiefly to European countries, as I am fully aware that there are localities in the southern hemisphere which enjoy meteorological conditions even more favourable for the growth of plants, which are natives of warm temperate climates; *e. g.*, Van Diemen's Land, and even the Island of Madeira in Europe. If this be admitted, it follows that Ireland must be influenced by some peculiar meteorological circumstances, which do not affect other countries situated in the same parallels of latitude; or those falling under the same isothermal lines on the surface of the globe. The prevailing cause, I presume, arises from the influence the sea exercises in equalising temperature in all countries which are broken up with gulfs and peninsulas, compared with those in the interior of compact masses of land.

It has been remarked by Dr. Lloyd that "Ireland, situated as it is at the north extremity of Europe, and exposed to the full influence of the northern branch of the gulf-stream which sweeps its western shores, has its temperature as high as countries on the southern shores of the Euxine." But it must be also considered, when reasoning on this subject, that the same causes which influence the high winter temperature operate in lowering that of the summer. Owing to the great amount of exhalations which take place, and the western winds crossing over part of the Atlantic Ocean, which prevail during the summer and autumnal months, we have generally cool, cloudy summers, which tend to lower the average mean temperature of the year. In Ireland, where those fine evergreen plants flourish so luxuriantly, it is not higher than in countries where there is some difficulty in preserving them during winter in conservatories, whilst, on the other hand, plants in those countries are much influenced by the greater summer heats which they experience, and are thereby enabled to ripen both their wood and fruit better. By tracing the isothermal lines over the map of Europe it will be found that the one which passes over the province of Munster extends on through Konigsberg, in Prussia, over the Isthmus of Perekop, on to the borders of the Caspian Sea, where Grapes and Peaches are produced in full perfection, without artificial aid—which is not the case in Ireland—but where many of our hardy trees and shrubs will not survive the intense frosts which occur during the winter months in those localities. It is thus clear that tender plants owe their existence in Ireland principally to the mildness of the temperature during the winter months, and not to the mean temperature of the year, which only averages 49½° Fahrenheit; in 1851 it averaged 50°, according to Dr. Lloyd. By referring to the highly interesting tables prepared by that gentleman, and lately published in the "Transactions of the Royal Irish Academy," it will be seen that the most important climatological laws, which are observed on a large scale through seaboard and inland counties over Europe, hold good in Ireland. On this head Dr. Lloyd observes, that, upon comparison of the mean yearly temperatures of the several stations where meteorological observations were made, it has been found that those of the inland stations are in defect, as compared with the corresponding coast stations—*e. g.*, the mean temperature of Armagh—48.6—is less 1 deg. than Donaghadee; and, again, the mean temperature of Markree—48.2—is less than that at Killybegs, on the coast of Donegal, by 2.6°, and that of Westport, on the coast of Mayo, by 3.5. Similarly there is an increase proceeding from east to west—Dublin being 49¼°, and Westport, 5.1.7; and from north to south, being at Portrush, on the Antrim coast, 49°, and at Dromore, on the coast of Waterford, 51° Fahrenheit, which are important data in aiding us to reach the proximate causes of plants being differently affected in various parts of Ireland, and will, no doubt, when better understood—*cæteris paribus*—go far to account for the distribution of some species in this country.

In applying myself more directly to the subject under consideration, I have not been able to obtain much relative information which could be depended on, to show at what previous periods any very intense frosts of long duration occurred in Ireland. It is said that the temperature has not been so low during the last 40 years; but there may be some mistake in this; my own impression is, that I saw the thermometer as low as zero in 1831, at the south side of the city, when a greater fall of snow occurred than we have lately experienced; plants suffered very much in consequence, though not nearly to the same extent they have this year, which may have resulted from the cold happening earlier in the winter, when they were in a more dormant state, or, probably, their wood had been better ripened during the previous autumn, thereby rendering them abler to withstand the effects of the frost. This year they were particularly liable to be injured, owing to the state of exciteability many of them were in, arising from the remarkably mild weather which had prevailed during the month of November, December, and January. The Roses had young shoots, on some of them several inches long, and were in full leaf, and other out-door plants were in a state of unnatural forwardness at that early period of the season. Scarcely any frost occurred during those three months to arrest vegetation, the thermometer not having fallen lower than to 28° above zero, indicating 4° of frost during November, and that only on one night. In December it also fell to 28° on one night, that being the lowest until the 28th of January, when it fell to 25°, up to which period the temperature of the winter months was equable and mild; yet I do not find so great a difference as I expected, on comparing the average mean temperature of the months of November and December, 1854, and January, 1855, with the corresponding months of the year 1851, as given by Dr. Lloyd, for the locality of Dublin. In his table showing the mean temperature of each month of the year at the several registering stations through Ireland, Dublin is marked for January, 43.3; February, 43.6; December, 43.3; which indicate a more than ordinary mild winter, since according to my calculations, taken from the readings of the thermometers at the Botanic Garden, registered once during 24 hours, the average mean temperature of the month of December, 1854, is 42°, and that of January, 1855, 40°, being rather under than over those of 1851. Those differences may, however, be owing, in some degree, to several readings having been taken in the one case during 24 hours, and only once in the other, as well as to the situations where the instruments were placed, the Botanic Garden being 65 feet above the level of the sea, and freely exposed, whereas the College is less than 10 feet, and, no doubt, influenced by the heat of the city. A very marked difference, however, occurs in February, the mean of that month having been 41.7 in 1851, whereas, in February, 1855, it was only 32° at the Botanic Garden, which I believe is the lowest on record; besides, the minimum thermometer fell to 2° above zero, indicating 30° of frost on the night of the 15th, and, again, on the 18th it fell to 5°, and on the 19th to 10°, which alone goes far to show the principal cause of so much destruction to our out-door plants; but when considered in connection with the state they were in at the time these frosts occurred, and the severity of the weather during the present month, when they were recovering, fully accounts for all the damage.

On the 6th inst., the thermometer marked 8° of frost, followed by a bright sun next day; and on the 25th, 7°, followed also by bright sunshine, along with piercing frosty winds which prevailed during the month, circumstances which have been very injurious to plants in their present condition.

I have already stated that I could not get any reliable registerings of the thermometer, indicative of the state of the weather during the early part of the present century; but Mr. Yeates has kindly furnished me with notes of the lowest points to which his thermometer fell during the last 12 years, from which I find it did not mark lower than 10° above zero during that period. I learn also, from the same data, that the greatest colds during those years occurred between the 6th to the 18th February, though in some instances in January.

Before passing from this part of the subject there is one other meteorological circumstance I shall briefly notice, because I consider that many of our herbaceous as well as woody plants owe their partial safety to it—namely, the unusually small fall of rain which occurred during the autumnal winter months. By referring to the meteorological tables published lately in the proceedings of this Society, it will be found that only 10¼ inches of rain fell from the 1st of July to the 31st of December, which is below the average quantity for that period in the neighbourhood of Dublin. The ground was, consequently, drier than it usually is in February; and although the smaller plants were snugly ensconced under a good covering of snow—which was, no doubt, the principal protecting medium—they would have suffered more had the ground been saturated with moisture, as I find the same species has been more affected in wet parts of the garden than where the ground is drier.

Having now considered, as briefly as I could, the prevailing meteorological causes which affect plants in Ireland, as well as those which have led to the destruction of so many in the present instance, it will have appeared that the moist equable temperature and cloudy skies which we generally experience during the autumnal months operate on them in two ways opposed to each other respecting their hardiness. Under these favourable climatal influences they often continue to grow luxuriantly up to Christmas, when their wood is soft and unable to resist frosts so well as it would be if the autumnal months were clearer and warmer to ripen it properly, and the early winter months sufficiently cold to arrest growth. Now, this is what takes place in those countries on the continent of Europe whose annual mean temperature equals that of Ireland, and also in several parts of England and Scotland the seasons are more marked, which accounts for the superior ripening of fruits, as well as the comparative hardiness of some plants; take, for example, the average mean temperature of the month of August, as it occurs in Hungary, and compare it with that of Dublin, under the same isothermal line; in the former it is 69.8, and in the latter only 60 deg.; but in November the scale changes conversely at nearly the same ratio.

(To be concluded in our next.)

ARE LARGE BOILERS ECONOMICAL?

Without in the slightest degree wishing to disparage the arrangements which Messrs. Weeks and Co. have made for heating their plant houses, &c., and which you have described at p. 807 of the last volume of the *Chronicle*, I may perhaps be permitted to ask the preceding question; and as I speak from experience, and have reason to doubt both the economy and policy of employing one boiler to do the work generally assigned to several separate and distinct arrangements, I imagine my convictions on the subject may not be without interest to those who are contemplating new arrangements, and who possibly may not have seriously studied the matter.

I may, therefore, premise that in 1843-4 I was entrusted with the re-arrangement of some old forcing houses and pits, to which were added a considerable extent of new erections. At that time Penn's system of heating was much in fashion, and being much interested in the matter and intimately acquainted with Mr. Penn, I was induced to adopt the "one boiler" system. The plan was for nine distinct pits and houses, and to supply both top and bottom heat to seven of them. The quantity of pipe employed was very considerable; indeed, power sufficient was provided to heat the whole of the houses properly with the thermometer 5° below zero, and a piercing north-east wind. One of "Hill's flue boilers" was employed (a better never had water put in it), and such a quantity of brass stop valves (costing, I think, about 42s. each), as makes me, now when I think of it, blush at the expense. The draught of the boiler was so good that it would burn anything and everything that was put under it; neither was the consumption of fuel large for the work done, while of ashes not a handful was taken out of the stoke hole in twelve months, the only residue of the fire being clinkers. This boiler for the thorough consumption of fuel and for the prevention of the loss of heat up the chimney, generally a great source of loss though but little observed, was the best I ever worked. Hence the arrangement, so far as the engineer was concerned, was in every respect complete. But how did it work?

The greater part of the glass was employed for forcing purposes, such as the growth of Pines, Melons, Cucumbers, stove plants, &c., and nearly 400 feet of pipe was employed to heat a large span-roofed greenhouse. The heating was complete, the attention to the fire was of course that of one instead of four or five, but as regards the valves to regulate the temperature of the various houses, how worked they? In one place we wanted a temperature of 75°, in a second 70°, in a third 65°, a fourth 50° and so on, the greenhouse being filled with hard-wooded plants merely requiring to have the frost excluded. So long as the valves were properly attended there was no difficulty in maintaining the temperature in the different compartments, but as the heat required shifting from one place to another, being one hour here, two hours there, and three hours in another place, the attention required was continuous, and hence, in the height of the forcing season, especially if the weather was severe, it was impossible, either day or night, to leave the valves for more than two or three hours together. And this was not the worst of it, for possibly just as the forcing department was got into proper condition to leave for the night, down went the thermometer in the greenhouse, and the heat must be turned on. Then rather than cool the water in the forcing department, it was stopped off at the boiler, and the poor attendant had not only to wait until the greenhouse was sufficiently warm to leave with safety, but he must also dance attendance until the forcing-pits were at the required temperature, and thus it may be fairly inferred that the heating of the greenhouse, in addition to the forcing-pits, required more attention from the stoker than would have been necessary had a separate boiler been employed to heat that one house.

I am, therefore, quite convinced that in point of labour and attention a single boiler involves more attention, and is far more difficult to manage, so far as accuracy of temperature is concerned, than if several separate boilers were employed.

Again, as to the expense of working and consumption of fuel—and here I may as well once more dispel the mystery in which this subject is involved. A given quantity of fuel contains a certain amount of caloric or heat. Now, that boiler which the most effectually absorbs or abstracts the caloric or product of combustion with the least loss by the furnace doors or up the chimney is the best; and it matters not what its form may be, whether square, circular, conical, flue, saddle, or tubular, so long as that object is attained. A given quantity of water requires a certain quantity of fuel to heat it, and it is a matter of very little importance whether one boiler or half a dozen be used so long as the caloric or heat is completely abstracted; the loss, if any, will be by the heating of the additional masonry of the six boilers and the five extra chimneys, but unless there is full work for the large boiler at all times, I am convinced that the loss by the additional masonry will be more than counterbalanced by the saving in only using the small boilers for such work as may be necessary in the summer season. As an example of the successful working of Mr. Weeks's arrangement, we are told that a small pit situated 365 feet from the boiler was raised 60° of temperature in a very short time, and for the purpose of testing the economy of large boilers, we will just examine this fact a little further. It is quite certain that in Mr. Weeks's case he does not, except in severe weather, require to use heat for more than one-third of his glass; in the summer not more than two or three houses require artificial warmth; and it is just possible that in a private establishment only this single pit for several months in the year might require to be heated. Allowing such, then, to be the fact, it is quite certain that the large boiler and the water contained in 730 feet of useless pipe must be heated to do the work which, under a separate arrangement, would be equally well accomplished by comparatively a tea-kettle and a handful of coals. Can such an arrangement be economical? The answer is too self-evident to need further explanation. It may be argued that this

is an extreme case; granted, but not more so than it might be necessary to put into practice.

There is yet, however, another view in which a single boiler will not appear very favourably. In my own case I was, one clear starry night just before Christmas, terrified with the exclamation from the man in charge of the fires, "Please sir, the boiler's burst!" and true enough it had burst, and by that simple accident nearly 20,000 plants, many of them of very considerable value, were, so far as the boiler was concerned, exposed to the tender mercies of the ice king. That night the thermometer fell to 15°, and during the whole time that new boilers were being put in—for I had done with the one boiler—the thermometer indicated several degrees of frost. Fortunately I was supplied with mats and other covering, and with the assistance of 10 to 20 lbs. of candles per night, and by burning charcoal in the houses I managed to pull through pretty well, but not without spoiling nearly 3 tons of hay used for covering, and severely injuring my whole stock of Polygalas, Boronias, Leschenaultias, &c. Such "a fix" as this I imagine would chill the ardour even of Mr. Weeks; in fact it gave my enthusiasm such a thorough cooling that it is quite out, and I shall eschew the single boiler arrangement for the remainder of my days.

The only view in which I could feel induced to advocate a "single boiler" would be as removing the nuisance of so many chimneys, for certainly they are great nuisances, but with a properly digested plan it is quite certain that the smoke of several different fireplaces might be concentrated in one chimney shaft. I have no objection to two or three houses being worked from one boiler, so long as the houses heat independently of each other and sufficient power is provided, but if three houses are attached to one boiler and that boiler only of sufficient capacity to heat one house properly, then, I say, whoever promotes such an arrangement, whether employer, architect, or gardener, does that for which his fingers ought to be burnt every time he goes near the boiler. If at the fireplace sufficient power is not provided to do the work assigned to the apparatus under any circumstances without forcing, it cannot work economically, and the annual loss of heat up the chimney and by the fire doors, and the consequent waste of fuel, will be more than would have paid for a proper arrangement at the first; in fact, it is the game of penny wise and pound foolish to its fullest extent. An extra pound or two on a good-sized boiler, or in a few score feet of extra pipe at the time of erection, is money well and profitably invested; for though, as a mere matter of fact, sufficient power may have been provided to heat a house properly with the water near the boiling point, it is quite certain that a much more healthy atmosphere will be generated if sufficient power is provided to do the work properly without the heat of the water ever exceeding 180°. Roaring fires and red-hot furnace doors may show that the stoker is doing all he can to keep the heat up, and there can be no question that he is at the same time working very profitably for the coal merchant. To have to put a boiler to its full force is bad policy and gross extravagance. In fact, our whole system of horticultural building requires revision—at least half the timber generally employed might be dispensed with, and a great proportion of the money expended in making sashes, building brick walls, and useless ornaments—too frequently mere harbours for insects, dust, and filth—would be more profitably invested in using better glass, and a more powerful heating apparatus. I may, however, recur to this subject some other day. *W. P. Ayres, Whittlebury Lodge.*

COMMON THINGS.

In raising Vines from cuttings, those which are furnished with two eyes each will be sufficiently long for the purpose; the lower part should be cut transversely, close to the bud. They should be planted singly in small pots filled with good mould, leaving the upper eye rather below the surface than above it. The pots should be placed either in a stove or in a hotbed, allowing the plants room as they advance in height, and shifting them into larger sized pots when they have filled the first with roots. As the season advances they may be removed into the stove or other hothouse, and from thence to the greenhouse, keeping them neatly tied up to sticks, and allowing them plenty of air, to prevent them from being drawn up weakly. Vines raised from single eyes require the same management as those from cuttings, beginning only with a smaller sized pot, and removing them into others as they gain strength and require room. Those raised from cuttings, as well as these, should be kept under glass throughout the summer, and a judicious application of liquid manure during the growing months would considerably promote the growth of both.

Cauliflowers.—The seed should be sown now for the autumnal crop upon a gentle hotbed. This sowing will come in during August, and for a later crop the seed should be sown the beginning or middle of May; this will furnish heads in October or November. If some of the plants of this last sowing be taken up and laid in like Broccoli they will be more secure in case of cold wet weather occurring at the end of the season.

Home Correspondence.

Disa grandiflora.—I quite agree with your remark (see p. 483, 1854), that there is no reason why this fine plant should not be found in every greenhouse in Europe. Eight years ago I procured some tubers of it, I potted them in a mixture of decaying turf and white sand, covered the surface with living sheets of Bryums, and placed the pots in the shade of trees, and there they have remained ever since without shifting, receiving (as they are evergreen) water once every day. Under this treatment they bloom freely. What amount of frost they will endure I cannot say, but I have frequently seen Potatoes destroyed with frost in a garden in which the Disa has been uninjured. *R. S. Smith, Mrs. Saunders', Grove Street, Cape Town.*

Transplanting late Peas.—Transplanting Peas to forward early crops has long been recommended; but having found transplanting late Peas so advantageous that in future I shall always practise it, I think it may be useful to your readers to have their attention directed to it. Having but a small garden, I grow only the finer kinds of Marrow Peas. These are at times a failing crop, coming up irregularly, in a manner difficult to account for. It is not the fault of the seed, for in some parts of the rows every seed produces a healthy plant, while in other parts every one perishes, or produces a weakly plant. These failing seeds, when examined, are found to be decaying, and full of small centipedes, 50 or 60 in a Pea. This cannot be from eggs existing in the Peas before they are sown; or there would not be in the same row, in some places, a dozen or more healthy plants together. Possibly the centipedes, aware that the Peas contain proper food for their young, and attracted by their peculiar sweetness, deposit their eggs in them after they are sown, passing on from one Pea to the next, which would account for parts of the row being almost wholly destroyed. The weakly plants appear to be caused by the substance of the Peas being devoured before the young plants have made roots sufficient to support themselves. Perhaps the Marrow Peas are more tender than others, and may be injured by the ground being in spots so much deprived of its moisture by drying winds that the sprouting Peas are dried and killed, as Barley is when malted; some being destroyed, others injured, and becoming, in their diseased state, attractive to the centipedes. However this may be, I have seen many crops of Marrow Peas injured as above described. So, in 1853, were my Peas (Hair's Defiance; a fine large Marrow Pea); and it was only by repeatedly sowing the missing places, and transplanting, that the rows were got at last to produce a moderate crop. To prevent the mischief described, and to secure a regular crop, I last year sowed all my Peas in a small bed; and afterwards transplanted the healthy plants, when 3 inches high, into rows. The seed was saved from the crop of Hair's Defiance, above mentioned. An ounce of spirit of tar, mixed with dry earth (recommended to me as destructive or repellant to insects), was trenched 3 inches deep into the bed, which was then levelled, and the Peas (previously steeped in water for 20 hours) were, about the 10th of March, sown by inserting them about 3 inches apart in the earth with the finger and thumb, each Pea with the root downwards. The roots can be plainly seen when the Peas are steeped; but only those who have time and inclination need to be thus particular. The bed when sown was pressed down with the back of the rake, and kept damp by slight sprinklings of water until the Peas came up. Few of them missed; but when Peas are sown to transplant—unless very few indeed be sown—though half were to miss, there would be sufficient left, as they go a long way when transplanted. Two rows 6 inches asunder, and the plants 6 inches apart, were set to form each row. This is quite near enough for large branching Peas. The rows (crops of other vegetables being grown between them) were 11 feet apart, planted north and south, to get the sun on each side. They were well sticked, and when 6 feet high, or a little more, had their tops taken off. These rows of Peas were perfectly regular, and quite as luxuriant in their growth as untransplanted Peas. They produce, as you will readily believe, when you consider their thorough exposure to sun and air, a good crop of fine full pods. The Pea, whether removed with or without earth, transplants better than any plant I know. Every plant which in its early growth may lose its top puts up another luxuriant shoot or shoots. Every plant in the half of one of my rows had its top taken off (by birds probably), but when the row was in flower, no difference could be perceived between that half and the other. The spoiled tops I pruned off for appearances' sake. My rows of Peas were as regular as well cut hedges, and being kept well to the sticks continued to put forth shoots and blossoms, and to bear Peas of good quality until the frosts destroyed them. In gathering Peas, all that are full grown (in which state the Marrow Peas eat quite young and tender) I gather; even should there be more ready than are required to be used. This keeps every gathering free from Peas which are too old. In the later gatherings of the season, when the pods become less plentiful, they are still regularly gathered, but at a little younger age, and are then placed upon the floor of a cellar until the quantity desired to be used at once has accumulated. Thus managed, the quality continues good. Should you consider this likely to interest your readers, I will (should you wish it) also send you an account of the means I use to stick my Peas securely, (pray do) my garden being much exposed to winds, since preventing Peas being injured by winds, &c., is essential to continued produce from the same crop. To make one crop continue to supply me during the season, and to have that crop a very productive one, are the objects I aim at, not having room to sow a succession of crops. It will be perceived, therefore, that my plan is particularly adapted to those who endeavour to compensate for the smallness of their gardens by taking greater pains, and try to acquire increased skill in securing a large and never failing produce from their crops. Every one must choose the time for sowing Peas, from his own experience of what is best in the place where he lives. For a large crop, it should be neither very early nor too late; in the first case, the plants are liable to be weakened and injured by bad weather; in the latter, by the heat forcing them into bloom before the plants have grown large enough, and their roots have penetrated deep enough into the ground. I dislike artificial watering: if the soil be deep, and in good order, Peas will find moisture for themselves. Warm sunny weather fills the pods; of course different situations will ever require somewhat different treatment. *John Ward, Queen's Road, Sheffield.*

Potatoes at the Cape.—As far as I have been able to learn all the kinds of Potatoes imported since the disease broke out in Europe are liable to the malady. Sometimes one-half or even more of the crop is destroyed sometimes only a few roots, but I believe it is always present. A sudden fall of rain, or an over dose of water in irrigating them, followed by a hot or perhaps a scorching day's sun, is sure to produce it, as will also a check from want of moisture. What is rather remarkable is the fact that the European kinds and some seedlings imported and raised before the disease broke out in Europe, are free from taint, although in one case I knew them to be mixed with diseased tubers before planting them. *R. S. Smith, Mrs. Saunders, Grove Street, Cape Town.*

Rhubarb and Seakale that have been forced in the Mushroom-house should now be planted out as soon as possible, and any roots that have been but lately removed from where they have been forced should be afforded the protection of an inverted flower-pot until they get inured to their altered circumstances. *W.*

American Timber.—Would you oblige me by naming the enclosed wood? It is largely used in Ireland in cart and car building, and in the upper works of coasting vessels, under the names of American Elm or White Elm. It is imported from Canada. It is exceedingly tough, pliant, and durable, but warps greatly. *B. A.* [It is the wood of Ulmus americana.]

Cardoons.—Seeds of these should now be sown in trenches 6 inches deep and 12 inches wide, into which a small quantity of rotten dung has been previously dug. The rows should be 4 feet apart, and the seeds should be sown in patches three or four together, and about 18 inches asunder. When the plants have acquired four or five leaves they should be thinned out to single plants. During summer they must be kept clean from weeds, and in dry weather frequently watered, as they require a good deal of moisture. About the end of October, when the plants have attained nearly their full size, a dry day should be chosen for earthing them up. When they are free from damp, the leaves of each plant should be carefully and tightly tied together with strong matting, keeping the whole upright, and the ribs of the leaves together. The plant should then be bound closely round with twisted haybands, about 1½ inch in diameter, beginning at the root and continuing to above two-thirds its height, covering the whole so as to prevent the earth when applied to it coming in contact with the ribs of the leaves. If the Cardoons are to be used early and before frost sets in, the plants may remain thus banded without earthing up, and will become sufficiently blanched for use; but if there is any danger of their being exposed to frost, then it is necessary that they should be earthed up in the same manner as Celery, care being taken that this is done, as has been stated, on a dry day, and not to raise the earth higher than the haybands. There have been other methods of blanching recommended, but plants treated as above have been found in all respects superior to others under different management. *H.*

Fruit and Potatoes uninjured by Frost.—In my fruit-room I had portions of Apples, Pears, and seed Potatoes; they were laid on clean dry straw, but not covered. In this room is fixed a cistern (for supplying a bath in the room beneath) the water in which was frozen so that the ice was full half an inch thick, while none of the fruit or Potatoes were injured in the least. Can any of your correspondents account for this? *G. H.*

Dielytra spectabilis.—Has any one ever tried the succulent shoots of this plant as a vegetable; or is there anything unwholesome in them? *Subscriber.* [No.]

Rhododendron Edgeworthi is now in flower here. The plant is about 2 feet and a half high; the flowers measure 5 inches in diameter; they are white, with a faint streak of pink, and emit a strong spicy fragrance. *I. Aiton, Enville Hall, April* 16.

Societies.

Botanical, of Edinburgh, *Feb.* 8.—The President in the chair. The following papers were read:—

1. *Account of a Botanical Excursion to the Braemar Mountains in August*, 1854, by Prof. Balfour.—2. *Report on the Diatomaceæ collected in Braemar in the autumn of* 1854 by Prof. Balfour and Mr. G. Lawson, by Dr. Greville.—3. *On the Geological Relations of some rare Alpine Plants*, by Dr. Gilchrist. The author remarked:—

"In August, 1853, I formed one of the party which now annually employs itself in botanical pursuits under the auspices of Prof. Balfour. Our ground for that year was the now classic region, botanically, of Clova. While there we had an opportunity of gathering a few of those plants which, from their rarity and isolation, would almost warrant the inference, either that they are new creations which have not yet had time to secure per-

season of a wider extent of surface, or that they are aged plants which have lived their time, and, yielding to the universal law of created life, are about to disappear for ever from this scene of things. Not being well satisfied with either of those theories, it occurred to me that some approximation, at least, to the solution of the problem might be obtained by an ascertainment of the nature and relations of each plant to the soil on which it grows, &c. The first plant examined was Oxytropis campestris, a plant rare in Britain, and confined to a single isolated locality in Clova. There it grows on a cliff facing the south in Glen Fiadh. The cliff is somewhat isolated from the surrounding rocks by two perpendicular indentations running along the entire face of the rocks, which, as they are not the result of water, but of weathering, would indicate some change in the structure or composition of the rocks. This is at once confirmed by an examination of the rocks themselves; that on which the plant grows, and to which it is limited, is a micaceous schist, extremely rich in mica, of a dark colour, and rapidly undergoing decomposition. The immediately surrounding rocks are of the same general character: but the mica is greatly less in proportion to the other materials, and lighter in colour.—The next plant was Lychnis alpina. It grows on the summit of a hill, called Little Gilrannoch, at about equal distances from Glens Isla and Dole. It seems limited to about half an acre of surface. The rock is a tabular mass of compound felspar, apparently capable of resisting decomposition. While in many places it is bare and flag-like, other portions of it present a singularly rough and irregular surface, as if the rocks had undergone fusion previous to expulsion, small portions of it bearing a distinct resemblance to similar specimens from the so-called 'vitrified forts.' The relations of this plant to the rock on which it grows are well seen, many of the specimens growing in little crevices of the bare rock, where there is not the slightest vestige of soil, ordinarily so called. The rock coextensive with the limits of the plant is unvaried in character. Its relations to those around could not be ascertained.—The Astragalus alpinus crowns the summit of Craigindal, a hill about 3000 feet in height. To the east of Braemar we gathered specimens of this elegant little plant, in two separate localities, at considerable distances from each other, but the rocks on which both grew were the same, a very pure compact felspar, of which the entire hill seems to be formed.—The Gentiana nivalis, found in Glen Isla, was also examined as to its geological relations; but, from the varying character of the rock and the difficulty of finding the plant, so as to ascertain its exact limits, the examination was not satisfactory. A porphyritic granite, rich in felspar, associated with a dark syenite, abounding in hornblende, was the prevailing rock.—With reference to the plants examined, two facts seem to have been ascertained: first, that each plant was limited in its range to a rock of the same specific character; second, that, in one case at least (the only one in which the examination could be completed), the limits of the plants' distribution, and of the rock possessing such character, were identical. On the ascertainment of these two facts, the writer would base the propriety of these remarks, as well as of the question he has now to ask, whether a farther and more minute examination is not justifiable and desirable."

4. *Descriptions of some new Coniferous Trees, recently introduced into this country by Mr. W. Murray, of San Francisco*, by A. Murray, Esq.—The expedition in which they had been procured left San Francisco under Mr. W. Murray's direction last autumn, and explored a considerable part of the range of mountains which runs between the coast range and the Rocky Mountains, lat. 40°, 41°, &c., N. The new Pines which Mr. Murray describes were the following, viz.:—Pinus Beardsleyi.—From the description given, it would appear that this tree has more affinity with Benthamiana than any other described species: but the cone of Benthamiana is 5 inches long, while that of Beardsleyi is only 3 inches. Its leaves are 11 inches in length, while in Beardsleyi they are only 6 inches. The sheath of the leaf in Benthamiana is an inch long, while in Beardsleyi it is short, being only an eighth of an inch. The wing of the seed in Benthamiana is much longer and larger than in Beardsleyi, and the seed itself is nearly twice as large. The timber of Beardsleyi is homogeneous all through; the heart of Benthamiana is redder than the sap wood, and the sap wood runs a long way into the stem. The tree is of great beauty and size; one which was cut down measured 123 feet in height, and 44 inches in diameter at the stump. Another tree next it measured 17 feet 4 inches in circumference, 3 feet from the ground. The stem was a very handsome column, about 30 feet to the first branch: timber good and clear. It was found on the top of the mountain, same altitude as P. Jeffreyi, monticola, and grandis, and higher than Benthamiana or Lambertiana. The Pine has been named in honour of A. F. Beardsley, Esq., who accompanied Mr. Murray in his expedition. Pinus Craigana.—This is a tree which also has some resemblance to Benthamiana as well as to the preceding species (Beardsleyi). It differs from it in having the prickle of the scale pointing towards the tip instead of the base. The prickle too is strong and firm in Craigana; in Beardsleyi it is small and weak. The apophysis or excrescence on the exposed part of the scale is much more developed in Craigana than in Beardsleyi, which has the exposed part somewhat flat; while in Craigana the upper part projects considerably over the lower. The wing of the seed of Craigana is shorter and relatively broader—the seed is nearly twice the size of that of Beardsleyi, although the cones are about the same size. The leaf of Craigana is also very distinct from that of Beardsleyi. It is much finer and not so long, while its sheath is considerably longer and more delicate. This species was found in the same mountains as Beardsleyi, but one-fourth of a mile further down, and higher up than Benthamiana. It spreads its branches wider from the stem than Benthamiana, and sheds its seeds a month later. This Pine has been dedicated to Sir William Gibson-Craig, who has done so much for the introduction and cultivation of this valuable family. Abies Hookeriana.—This species is closely allied to Pattoniana introduced by Jeffrey, and figured by the Oregon Committee, but may be readily distinguished from it by the following characteristics. Both trees are of exceeding beauty; but Pattoniana is described by Jeffrey as being 150 feet in height, and towering over the rest of the forest: the height of Hookeriana was only about 50 feet. The cones of Pattoniana are uniformly of a dark brown colour, while those of Hookeriana are of a light fawn, somewhat of the hue of our common Larch cone. The scales of Pattoniana are at least a third less than those of Hookeriana; they are deeply and firmly crenulated, while those of Hookeriana are not crenulated. The bract of Pattoniana is quite differently formed from Hookeriana: in the latter it commences to contract near the top, which it does not in the former. The seed and the wing of Pattoniana are both about one-third shorter than in Hookeriana, and the wing of the former has a purplish brown tinge at the top and back, while the latter is entirely fawn coloured. This species was found high up the Californian mountains, about lat. 41° N., where the ground was already covered with snow on the 16th of October. Cupressus Lawsoniana.—This was the handsomest tree seen in the whole expedition. It was found on the banks of a stream in a valley on the mountains: is about 100 feet high, and 2 feet in diameter; the foliage is most delicate and graceful. The branches spread upwards like a Spruce, and hang down at the tips like an ostrich feather: the top shoots droop like a Deodar. The timber is good, clear, and workable. Cupressus Macnabiana.—This is the same species as one sent home by Jeffrey, without a name, and distributed by the Oregon Committee in 1852. The cone is about the size of a Hazel-nut, with hard scales, having a projecting umbo in the centre. It is of small growth, and fitted for shrubbery. Taxus Lindleyana.—This tree was found growing on the banks of a creek, under the shade of lofty trees. It was of considerable size: the trunk of one which was measured being 50 inches in circumference at 5 feet from the ground. The branches are exceedingly long and pendulous, and the wood extremely elastic. It is used by the savages for their bows. The berry is red, and grows on the under side of the branches. It is exactly like the berry of the Irish Yew.

Notices of Books.

The Entomologist's Annual for 1855, *comprising Notices of the New British Insects detected in* 1854. Edited by H. T. Stainton. 2d Edition. 12mo. 153 pages and coloured title-page. Van Voorst.

For more than 20 years past we have been indebted to our indefatigable German friends, Burmeister,* Erichson, and Schaum, for an entomological annual, in which, with vast labour, all the publications and scattered memoirs upon the science have been concisely reviewed and brought into one focus. The little volume before us is, however, an annual of a different kind, its chief object being to collect together notices of all the new species of insects as they occur in this country, although the editor has added a few pages of descriptions of a few recently published entomological works. The present being the first of, it is to be hoped, a continuous series of volumes, has been confined to the orders Lepidoptera (by the editor), Hymenoptera (by Mr. F. Smith), and Coleoptera (by Mr. Janson). Instead, moreover, of being restricted to the insects detected in 1854, the new Lepidoptera discovered since 1835, New British Bees since the publication of Kirby's Monographia (1802), New fossorial Hymenoptera since the publication of Shuckard's Essay (1837), and new British Coleoptera since the publication of Stephens' Manual (1839), are included in the present volume.

Thus we have 175 additional British species of Lepidoptera (exclusive of Tineidæ and Crambidæ), 58 new Bees, and 227 new Coleoptera included in these lists, with references to their places of capture and notices of their publication. In the Lepidopterous portion we are surprised to find no reference to the late Mr. Wing's excellent figures, published in the supplement to Wood's Index; no fewer than 141 out of the 175 supplemental Lepidoptera being carefully represented in that work. From a passage also in p. 151, it is evident that the editor is unacquainted with M. Marloy's "Observations sur quelques chenilles de Satyres," published in the "Annales" of the French Entomological Society for 1838.

The work contains also an address to young entomologists, and instructions for collecting and preserving Lepidoptera, with other general remarks by the editor, and instructions for collecting and preserving Coleoptera by Mr. Wollaston, adding greatly to its utility. The following passages, urging the utility of a knowledge of the Latin and foreign languages, extracted from the address to young entomologists, will serve to show the character of this portion of the work:—

"To read the memoirs of Réaumur and De Geer it is necessary to know French, and a facility in reading Latin and German will also be found no mean advantage. The entomologist, therefore, immediately finds a personal interest in prosecuting his studies of those languages. Instead of saying, as many others might be tempted to say—'Of what use will Latin be to me?' he exclaims—'I shall then be able to read Haworth's Lepidoptera Britannica;' instead of despising French as a language 'good enough for girls,' he is anxious to get on with it that he may have no difficulty in reading Réaumur and De Geer. Now, though it be quite true that these studies ought to be pursued in good earnest from a sense of duty, yet when we can do so, it is surely desirable to give the scholar a personal interest in the steady prosecution of his studies.

"The philological skill which is used in deciphering some obscure passage in Xenophon or Thucydides may, later in life, be of use in enabling an entomologist to unravel some obscure description; indeed, the classical student soon gets to learn that, to ascertain an author's meaning, the only way is to familiarise yourself perfectly with all the author's modes of expression. Individuals rarely use the same combination of words to express exactly the same ideas, and an author's meaning is best elicited by a reference, not to a dictionary, but to himself."

From all interested in the progress of British natural history, the volume before us will be sure of a welcome, and most especially so from those who have experienced, as we have, the trouble of hunting up the notices of newly recorded species, scattered here and there in our various miscellaneous natural history publications.

Garden Memoranda.

Crystal Palace, Sydenham.—On Monday last everything was being put in as complete a state as possible for the reception of the distinguished personages who were about to honour the building and gardens with their presence. In the centre transept a dais was being erected, which was to be profusely ornamented with plants in flower, and the latter we understood were also to be liberally introduced throughout the building. As regards plants permanently turned out into the beds we have to report that they have stood the winter uncommonly well. The only one apparently killed is a large Pimelea decussata, near the entrance at the west end. One or two other things have also had their leaves a little browned; but altogether the injury sustained is extremely trifling. Acacias and Camellias have been flowering freely until within these last few days, whose heat and brilliant sunshine have driven them very much out of blossom. The large Indian Azaleas that have been planted out seem to have become perfectly established and are covered with flower buds, which, when expanded, cannot fail to produce a striking effect. The huge Epacrises bought at Mrs. Lawrence's sale and elsewhere have also taken well in their new situations; they promise to yield a fair crop of flowers, as well as furnish themselves plentifully this year with young wood. The two noble Norfolk Island Pines (Araucaria excelsa), from Chatsworth, in the centre of the building, are especially worthy of notice; and those presented by her Majesty are likewise in excellent condition. The Bourbon and other Palms planted in front of the Roman Court, the fan like leaves of which give to this cool part of the building quite an exotic appearance, have also wintered safely, with the exception, perhaps, of Ceroxylon Andicola, which has been nearly killed, even where Cocos plumosa, and things usually considered equally tender, have stood. The handsome Rhopala corcovadensis is unhurt, and Sparrmannia africana is now in flower, the latter emitting a by no means disagreeable fragrance.

All the tubs containing the large Orange trees have been painted green, and the naming of the plants throughout the building with proper labels has been commenced. The tops of the labels employed are made of wood—square, with the two upper corners cut off—and are furnished with iron spikes for fixing them in the soil. The name is written with white lead on a bright blue ground. The increased interest which this will give to the gardening part of the decorations needs, we think, no comment.

The creepers on pillars have for the most part begun to break strongly, and in a week or two the large Wistaria from Messrs. Loddiges will be in flower. The baskets suspended from the roof have been top-dressed, and the plants in them trimmed and put in order for the season.

In the aquariums, which are well stocked with water plants, we remarked thriving examples of Victoria regia. The vases round the water are well filled with things in flower, and the small round basins, out of which these vases with their pedestals rise, contain beautiful collections of Hyacinths, early Tulips, and other forced bulbs, which have been (and deservedly) much admired. Early Tulips and a few Hyacinths are also planted out in the beds, and serve to keep up a considerable amount of gaiety at this season until other plants come into flower.

The more tender Palms, Orchids, and other plants in the warm end of the building have, on the whole, done well. The Musas have suffered most; these have lost their leaves, but they are now beginning to push new ones. The Mangosteen has been tried here, but without success.

Out of doors the grounds may be said to be fast approaching completion. The great centre walk has been put into shape almost down to the boundary fence, where it is to terminate in a kind of temple. Below the lakes a row of Deodars has been planted on either side of it. They measure from 8 to 10 feet in height, and stand some 40 feet apart. The water towers for supplying the fountains are nearly built; one is quite ready for the reservoir on the top and the other is very nearly in as forward a state. It is expected that the fountains may be ready to play in June next. The water temples have been completed, and are ready for colouring; the cascades leading from them to the great lakes in the lower part of the grounds have been made, and the lakes themselves are ready to receive the iron piping for the fountains. On the rising ground beyond these noble pieces of water are to be seats surrounded by handsome stone balustrades. From these resting places, overlooking as they do the lakes below, a front view of the cascades, the water temples and the palace beyond them will be obtained, as well as a sight of most of the more prominent features of the park. The high ground behind where the geological illustrations have been placed, and indeed the whole of the hill face opposite the lakes and islands where the extinct animals are, has been planted, and is traversed by walks, which pass here and there over rustic steps, or wind among scenery of a semi-wild character; here a kind of massing system has been followed, Lilacs, Rhododendrons, Thorns, Arbutuses, Cotoneasters, Gorse, Heath, Broom, &c., having been planted in distinct groups so as to give breadth of effect, due regard being paid at the same time to harmony of colour. Specimen Conifers and other trees which are intended to form part of the Arboretum have also been planted in places where they will be seen to the best advantage. Passing still further round towards the Anerley side an extensive and extremely well managed root-work has been formed on the little hill which hides the railway station from the park. Here, in addition to Rhododendrons and other flowering shrubs which have been planted among the rough rustic looking roots, have been introduced such plants as Squills, Primroses, Wood Anemones, Foxgloves, and things of that sort which are so beautiful in early spring, and which are naturally looked for in situations of this kind. A large rockwork is also in course of formation on the other side of the park in the hollow below Sir Joseph Paxton's house; and on a natural knoll a little further on, on the same side, a kind of temple is to be built with glass roof and sides of open lattice work suitable for training climbers on. This will form a companion to the Rose temple on the opposite side, which has just received some additions in the shape of rapid growing climbers, so as to give it a temporary covering till the Roses get up a little.

From what has been stated above our readers will perceive that with the exception of filling the lakes and

* The author of the Coleopterous portion of the work before us does not seem (see p. 112) to be aware that Burmeister originated these Berichts.

bushes with water, planting the islands where the antediluvians are, gravelling some of the walks, and turfing or sowing with fine lawn-grasses the still bare portions of the grounds, little now remains unfinished.

With respect to the effects of the winter on the out-door plants, we may mention that little loss has been sustained. A large Sweet Bay appeared to be dead, and some of the larger Rhododendrons in exposed places have lost a few of their branches and have had their leaves browned; but nothing of importance has been seriously hurt. Deodars have been cut up a little, but they are now breaking afresh; altogether, both plants and grounds are looking as well as could reasonably be expected, and are now, it need scarcely be added, every day becoming more attractive. The walks in the terrace gardens are well rolled, and the Grass here and elsewhere has grown so fast within the last week that mowing has been commenced. This is conducted by means of scythes and Shanks's mowing-machine, which is said to be the best for large places.

Miscellaneous.

New Vine Disease.—The *Guienne*, a Bordeaux journal, states that another malady has broken out in the Vines. It consists of a sort of scab, and has received the name of itch (*gale*). According to some persons, it is an old complaint which has afflicted the Vines, though at very rare intervals; and according to others, it is a modification of the existing malady; but whatever the malady may be, it appears that it has done already great injury. In the commune of Condate, near Libourne, not fewer than 10,000 plants have been killed on one single estate, and have had to be pulled up. A great number of others, less severely attacked, have been cut down, in order to shoot out again. At Pessac the malady has also appeared, but has not done such great injury. The *Guienne* adds that in the districts of Entre-deux-Mers and the Bas Médoc, a small number of Vines has also been killed by a malady the precise nature of which has not yet been ascertained. It further states that at St. Macaire the Vines have been similarly attacked.

Calendar of Operations.

(*For the ensuing week.*)

PLANT DEPARTMENT.

Conservatory, &c.—Any attention which will serve to prolong the flowering of the Azaleas and New Holland plants, which at this season contribute so greatly to the beauty of this house, will be well bestowed, as when these are over it will, in most cases, be impossible to furnish the house with equally handsome specimens, affording the same variety of colour which these do. Shading should be used on the forenoons of bright days, and every care exercised to keep the atmosphere of the house from getting too dry; also attend carefully to the watering of the plants, looking round on the forenoons of bright days to see if any of them are flagging, for bright warm weather coming so suddenly after the long sunless time through which we have just passed will tell severely on plants that are not properly moist at the root. Admit air freely on fine mild days, but sprinkle the borders, &c., frequently to keep the atmosphere moist. Greenhouse, &c.—Soft-wooded plants, as Pelargoniums, Fuchsias, &c., should now be carefully attended to, for it will soon be necessary to depend to a great extent upon these for the decoration of the show house. Fuchsias must not be allowed to become at all pot-bound until they are in their flowering pots, for this would check their growth and throw them into flower prematurely; neither must they be exposed too freely to sunshine, which would harden the wood and prevent free growth. Give air abundantly in the early part of the day when the weather is favourable, but shut up early, dewing the foliage over with the syringe, and saturating the atmosphere with moisture. Large specimens that have been cut back for blooming in autumn will be best in a shady part of the greenhouse, where they can be freely supplied with air to prevent their making soft weakly growth; stop any shoots that seem inclined to take the lead of the others, and also to induce a close bushy habit of growth. Some of the strongest of the Geraniums may be stopped and repotted for blooming late in the season, and although these will not make such plants as are commonly seen in June, they will be useful for cutting from. Scarlet Geraniums, when well grown and bloomed, are very useful for autumn decoration, but a well managed plant of these is rarely seen. They are generally over-potted and grown too fast, and consequently are more conspicuous for fine healthy green foliage than a profusion of flowers. To bloom them in perfection they must be treated very much as Pelargoniums, only they will bloom almost equally well in June or September, according to the season at which they may be cut back, &c., and by carefully supplying them with manure water, &c., they are easily kept in perfection for months. See that Calceolarias, &c., are not infested with green fly, and apply Tobacco smoke immediately this nuisance is perceived.

FORCING DEPARTMENT.

Pineries.—Where the houses are glazed with large sized squares, and the plants are close up to the glass, a thin shade will be of great service on bright days; but only a thin material should be used, for the object in shading should be to break the force of the sun's rays, not to darken the house. Give air rather freely on fine days, but shut up early in the afternoon, sprinkling the growing stock lightly with the syringe and well loading the atmosphere with moisture by sprinkling every available surface. See that plants growing in the open bed are properly moist at the root, giving a thorough soaking when the soil is found to be dry, for mere surface watering is of no use here. Fruit beginning to change colour should be afforded as dry an atmosphere as circumstances will admit, and the flavour will be improved if the soil inclines to dryness during the ripening period. Do not neglect to stake fruit that require it until they get disfigured by the crowns growing to one side; also attend to repotting succession stock before the roots get too much matted, and see to having the balls moist at the time of shifting, as allowing the plants to grow too long in small pots, or shifting when the balls are not properly moist, often causes the plants to fruit prematurely, particularly at this season. Endeavour to keep the newly-potted stock as much together as possible, in order to be able to afford it rather more shade and moisture and less air, until the roots strike into the fresh soil. Queens, intended to furnish the autumn supply of fruit, should by this time be well established in their fruiting pots; and where this is not the case, they should have every possible attention, for it is easier to retard these than to induce growing plants to show fruit. Vineries.—Where it is desirable to retard the breaking of the Vines in the late house as long as possible, and the glass cannot be removed nor the Vines exposed to the open air, they should be let down as far from the glass as can be done, shading the roof, and giving all the air possible. We are not quite certain, however, that there is any decided advantage in retarding Vines by artificial means after this season; nor that Grapes ripened by artificial heat late in autumn will keep longer than those ripened earlier in the season with little or no fire-heat. But it is well known that Grapes ripened by artificial heat late in the season are inferior in quality to those matured while the sun has some power, and fruit of inferior quality is generally so little esteemed, that it is hardly worth having at any season. We would almost invariably allow the buds to start at the bidding of the weather after this season, merely giving all the air possible, and take chance as to the fruit keeping until next March, preferring the certainty of a crop of prime fruit to being able to furnish a very late supply. Weakly or overcropped Vines ought to be very carefully examined for red spider, which may be expected to make its appearance on these, particularly if the weather continues bright, and means should be used to thoroughly eradicate it the moment it is perceived. Probably the best method is to well wash every affected leaf with a sponge, for it is useless trying to overcome it in such cases by syringing, which only serves to keep it in check, and when the fruit begins to colour, and syringing must be laid aside, it will increase with fearful rapidity. Keep the atmosphere moist, sprinkling the floors, &c., frequently on bright days, and take care that inside borders are well supplied with water.

FLOWER GARDEN AND SHRUBBERIES.

The unusually low temperature which has characterised this spring has been very unfavourable for newly planted evergreens, and especially for large plants that have been transplanted lately, for the ground has been so cold that active roots have not been formed so freely as would have been the case had the weather been warmer. And should the bright dry weather which we are now experiencing last long it will be very trying to things that have but few active roots to furnish them with support, and unless prompt attention as to watering, &c., is afforded many of the spring transplanted things will be likely to fail. Those who may have an opportunity this season of judging between September, and winter or spring planting, will probably have ample proof that early in autumn is the best season for removing large shrubs or trees. Look over all recently shifted things sufficiently often to prevent the chance of anything being injured through the want of water, and such as appear to be suffering should be sprinkled over-head with the engine on the evenings of dry days. Newly laid turf will also require attention should the weather continue dry and sunny, but a few waterings and a little finely sifted soil thrown over it and brushed into the joints will generally be sufficient to keep this from injury until the roots get hold of the ground. Persevere with the work of mowing, &c., until the turf is rendered as close and smooth as it is well possible to get it, for if the Grass is not brought thoroughly under early in the spring it is nearly impossible, without disfiguring the place, to get a close velvety turf afterwards, and well kept turf adds so much to the beauty of a garden that it should be secured at any sacrifice.

HARDY FRUIT AND KITCHEN GARDEN.

New plantations of Asparagus and Globe Artichokes should be made at once, choosing good deep rich soil that has been prepared by being heavily manured and trenched 2 or 3 feet deep; also give the Asparagus beds their spring dressing, first lightening up the surface soil with a blunt pronged fork and clearing the beds of weeds. Some seed of Seakale and Asparagus should also be sown to furnish a supply of young plants. Put in successional crops of Peas, and earth up and stake those that are above ground. Protect seeds appearing above ground from birds and slugs. Prick out Celery for succession crops, and attend well to the early plants with water; and if they are under glass see that sufficient air is given to keep them stocky. Seed should also be sown for the late crop. Attend to keeping up a supply of all kinds of small salads by sowing frequently. Stir the surface of the ground among all growing crops to prevent the growth of weeds and keep the soil open.

STATE OF THE WEATHER AT CHISWICK, NEAR LONDON
For the week ending April 19, 1855, as observed at the Horticultural Gardens.

The highest temperature during the above period occurred on the [illegible] 1840—therm. 81 deg.; and the lowest on the 24th, 1854—therm. 18 deg.

Notices to Correspondents.

Books: *J W.* Cuthill's papers on Market Gardening, reprinted from our columns in the shape of a small pamphlet, is the only work that has been written on the subject.‡

Boilers: *R P.* Any of the boilers now generally in use answer very well. The setting and the furnace doors, which should be on Sylvester's patent, are more important than the form of the boiler. It is, however, desirable that it should be of cast iron. The form of the pipe is immaterial, provided you secure a surface not less than that of a 4-inch cylinder. It is a good plan to have troughs cast on the pipes, and in practice this is found much better than open tanks, the evaporation from which cannot be easily prevented when it is not required.

Dracæna indivisa: *An Old Sub.* Plant this on a bank or terrace raised a few feet above the surrounding level, and avoid stiff clay about its roots while young. Also take care that it is well sheltered from dry cold winds. After all, hard winters will injure it, except in our best counties. We presume that Embothrium lanceolatum is to be grown like a Grevillea or Hakea; but we are unacquainted with it in gardens.

Dried Plants: *S S., Cape Town.* In this busy country you will hardly find a botanist inclined to accept your proposal. The books you want are Harvey's "Genera of Cape Plants," Pappe's "Medical Flora of the Cape," and Schultes' edition of Thunberg's "Flora capensis."

Garden Walls: *Tyro.* Your inquiries are so numerous that an answer is necessarily deferred till next week.

Ginger: *J S.* Any respectable nurseryman can supply you with roots, or they may be got sometimes at Italian warehouses. Plant them in 8-inch pots, and grow them in a Cucumber or Melon frame.‡

Lentils: *Old Sub.* Treat them in the same way as you would Vetches.‡

Names of Plants: We have been so often obliged to reluctantly decline naming heaps of dried or other plants, that we venture to request our correspondents to recollect that we never have, or could have undertaken an unlimited duty of this kind. Young gardeners, to whom these remarks more especially apply, should bear in mind that, before applying to us for assistance, they should exhaust their other means of gaining information. We cannot save them the trouble of examining and thinking for themselves; nor would it be desirable if we could. All we can do is to *help* them—and that most willingly. It is only requested that, in future, not more than four plants may be sent us at one time.—*Sub.* 1, Polystichum aculeatum in a young state; 2, Asplenium Filix-fœmina, so far as can be judged by the very imperfect specimen; 3, Polystichum aculeatum; 4, Lastrea dilatata. Several causes may be assigned for your Ferns turning black, such as cold and the soil stagnant during winter. If your case has no artificial heat, then you need not wonder at the Lycopodium arboreum becoming yellow; the cold moist atmosphere inside the case and winter light are sufficient to make it turn yellow. *S.—F H.* Abies taxifolia is hardly even a variety of A. Douglasi. Lists are the best you can get: but they will not bear examination by a well informed critic.—*May.* Plants not in flower cannot be named.—*T T.* Lycaste macrophylla and Oncidium (Cyrtochilum) macrophyllum.—*J C L.* Maxillaria [illegible] Epidendrum variegatum. The little flower that accompanies them is too much shrivelled to be identified. It looks like M. uncata.—*W B, Cantab.* Plants cannot be named from unscientific drawings. We suppose yours to be Genista barbata.

Osage Orange: *J.* You will find the information you want respecting this plant fully given in our volume for last year, p. 299.‡

Strawberries: *A B.* What ails them we are unable to say with certainty; but they look as if they had been injured by [illegible] Have the sides of the pots been exposed? If so, that will account for the failure. Permitting the soil to become saturated with water would also tend to increase the evil.‡

Supposed New Esculent: *C J R.* The Bamean, Gombo, Ochro, which you have received from Bucharest is nothing [illegible] It is the common annual Hibiscus (Abelmoschus) esculentus, whose young pods are employed everywhere, in hot countries, as an ingredient in soups, for the sake of its mucilaginous qualities. It will not succeed out of doors in this country, our summer heat being too low.

Roses. *G B.* Guano dissolved in water is a good manure for Rose trees, as is also night soil and water, but the latter, as rightly state, has the disadvantage of being disagreeable to meddle with.‡

Tan Beds: *W M R.* Put them up just as you would dung beds. They are best without walls, as when their heat declines a lining of dung can be applied to them with more effect than when they are surrounded by brickwork, even though the soil is pigeon holed.‡

Vines: *P J M.* The specimens sent are evidently dead. From what cause it is impossible to say without personal inspection on the spot, if then. Such cases are not uncommon. The best plan is to remove the plant at once, and put a young one in its place.‡

Vinery: *A B C.* We suppose your border to be cold and wet. But all cases like yours require to be examined on the spot. No doubt the fault lies with the border in some way or other.

Vine Borders: *A Labourer.* Concrete the bottom of your border if you like, and are on a cold heavy soil; but on account employ gas tar for the purpose.

Wire Worms: *C W F.* If your land is in the state you describe you will hardly make head against these grubs. All you can do is to catch them with pieces of old Potato. If the crop were ours, we should burn the whole of the top spit.

*** As usual, many communications have been received too late, and others are unavoidably detained till the necessary inquiries can be made.

PERUVIAN GUANO, Bolivian Guano, Superphosphate of Lime, Nitrate of Soda, Sugar Scum, and every description of Artificial Manures, Linseed Cakes, &c.
WM. INGLIS CARNE, 10, Mark Lane, London.

THE FOLLOWING MANURES are manufactured at Mr. LAWES' Factory, Deptford Creek:—Turnip Manure, 7l. per ton; Superphosphate of Lime, 7l.; Sulphuric Acid and Coprolites, 6l.
Office, 69, King William Street, City, London.

N.B. Genuine Peruvian Guano, guaranteed to contain 16 per cent. of ammonia. Nitrate of Soda, Sulphate of Ammonia, and other Chemical Manures.

WHEAT AND OTHER MANURES ON SALE.—The success attending the application of the manure specially adapted for Wheat during the last two years, induces the undersigned to again offer it to the Agriculturists with confidence. Also Superphosphate of Lime, Blood Manure, Guano, Nitrate of Soda, Gypsum, Salt, Peat Charcoal, and all other Manures of known value.—Apply for Prices Current to MARK FOTHERGILL & CO., 204A, Upper Thames Street, London.

SEWAGE CHARCOAL MANURE.—This highly fertilising Manure, which is Peat Charcoal completely saturated with London Sewage, will be found most efficient for every species of crop; more especially for Peas, Beans, Turnips, Mangold Wurzel, and other root crops. It will produce a greater return for the outlay than Guano or any other Manure at an equivalent value: it also possesses the property of retaining its fertilising power longer than other Manures now in use. It may be obtained at the SEWAGE MANURE WORKS, Stanley Bridge, Fulham, at 4l. per ton, and in quantities less than half a ton, at 5s. per cwt., for ready money only; and in quantities not less than a ton, will be delivered at the London Termini of the Railroads free of charge for cartage. No charge for sacks.

It may also be had from Messrs. G. GIBBS & Co., 26, Down Street, Piccadilly, Agricultural Seedsmen, Agents for London, and from all the other Agents of the Company.

PATENT SANITARY SEWAGE COMPANY'S NITRO-PHOSPHATED CARBON OR BLOOD MANURE, 5l. 10s. per ton; delivered in London, bags included. Each ton contains 1350 lbs. Blood and 11 per cent. of Phosphate of Lime.—Agents throughout the country.
22, Lincoln's Inn Fields, London.

ESTABLISHED 1850.

THE NITRO-ORGANIC MANURE COMPANY,
(Late the Manchester Sewage Guano Company),

Have much pleasure in informing their Friends and Agriculturists generally, that in order to secure the most complete arrangements in all the Chemical Processes in the Manufacture of their Manures, they have engaged the professional services of Dr. EDWARD FRANKLAND, F.R.S., F.C.S., Professor of Chemistry at Owen's College, Manchester, to analyse all the various Manures made daily at their Works, and they have empowered him to reject every portion which is not found to be of the full standard quality. This arrangement will secure to all their customers a standard and uniform manure, of equal or greater value (in proportion to its cost) than foreign guano, and on which agriculturists may confidently rely.

The Nitro-Organic Manures are a Compost of Blood, Bones, Urine, Nightsoil, and other animal matters, and highly fertilising Chemical Ingredients, which, in a concentrated state, are incorporated with prepared Charcoal, and forming dry portable manures, which enrich the land for several years after they are applied.* They may be used in all cases, exactly the same as Peruvian Guano, *at equal cost per acre.*

For top-dressing, the Manure is recommended to be applied in all cases in wet or showery weather. If convenient, the Nitro-Organic Manures may be used with very beneficial effect along with a small dressing of common farm-yard manure, or nightsoil, in which form they have been strongly recommended.

PRICES OF THE NITRO-ORGANIC MANURES.

For Grass, Clover, &c.	£5	5	0	per ton.
For Wheat, Oats, Barley, Rye, &c.... ...	6	6	0	„
For Turnips, Mangold Wurzel, & Potatoes	6	6	0	„
Deodorising Charcoal...	1	10	0	„

TERMS—Net Cash on delivery; Carriage Free to any Railway Station or Canal Wharf in Manchester.

JOHN THOMPSON, Secretary.

3, Watling Street, Shudehill, Manchester, March, 1855.

*** The use of Sewage having for some time been discontinued, the opportunity presented by a change in the late Company has been taken to alter the name to one more characteristic of the actual constituents of the Manure.

THE PATENT NITRO-PHOSPHATE OR BLOOD MANURE COMPANY.—Provisionally Registered pursuant to the Act 7 & 8 Vict. c. 110.

Trustees.

Abel Smith, Esq., Jun., M.P., 2, Halkin Street West.
Charles Dimsdale, Esq., Essendon Place, Herts.
Edward Ball, Esq., M.P., 8, Belgrave Road, Pimlico.
Major-Gen. Hall, M.P., Weston Colville, Linton, Cambridge.
John Brady, Esq., M.P., Warwick Terrace, Belgrave Square.

Directors.

Chairman.—Jonas Webb, Esq., Babraham, Cambridgeshire.
Deputy-Chairman.—John Sharp, Tower Villa, Queen's Road, Regent's Park.

Edward Bell, Esq., Tottenham, Middlesex.
John Clayden, Esq., Littlebury, Essex.
Richard Hunt, Esq., Stanstead Abbot, Herts.
Thomas Knight, Esq., Edmonton, Middlesex.
Robert Leeds, Esq., West Lexham, Norfolk.
Robert Morgan, Esq., 72, Camden Villas, Camden Town.
Thomas Nash, Esq., Great Chesterford, Essex.
James Odams, Esq., Bishop Stortford, Herts.

John Collins, Esq., Middleton Square, Pentonville.
With power to add to their number.

Bankers.—Messrs. Barnett, Hoare & Co., Lombard Street.
Auditor.—James Caird, Esq., Baldoon, and 9, Little Ryder Street, St. James's.
Solicitors.—Messrs. Kingsford & Dorman, 23, Essex St., Strand.
Secretary and Chemist.—James Taylor, Esq., F.C.S.
MANUFACTORY, PLAISTOW MARSHES, ESSEX.

The Directors of the above Company beg to call the attention of their friends and the Agricultural Community to their Blood Manures for Corn and Turnips, which have been used with the greatest success in all parts of England, and to assure them that having now erected commodious Works, with every suitable convenience for carrying on the manufacture on a large scale, under the management of an experienced practical Chemist, the Agriculturists of this country may depend upon having a manure of proved high quality, which the Directors guarantee to be genuine. It is sent out in the form of a fine friable powder, which may be sown by the drill or hand with the utmost facility.

They beg to caution the public against the attempts of spurious imitators, who, since the introduction of this Manure, have professed to make one possessing similar qualities. As security, therefore, to the purchaser, every bag is marked "Odams' Patent Blood Manure," and sold only by the authorised Agents of the Company.—Corn and Grass Manure, 7l. 10s. per ton.

Directions for Use.—From 2 to 3 cwt. per acre, according to the condition of the soil. It may either be drilled in with the Seed, or sown broadcast; if the latter, it should be well harrowed in. Turnip Manure, 6l. 10s. per ton.

Delivered at any Railway Station or Wharf in London.

Applications to be made to ODAMS, PICKFORD, & KEEN, Agents for the above, 35, Leadenhall Street, London.

CORN MANURE FOR SPRING SOWING.
CONCENTRATED URATE FOR GRASS, RAPE, AND ALL ROOT CROPS.
SUPERPHOSPHATE OF LIME.

THE LONDON MANURE COMPANY continue to manufacture the above Manures, which have been used with so much success for the last 14 years.

The London Manure Company also supply PERUVIAN GUANO (direct from importers' warehouses), Nitrate of Soda, Sulphate of Ammonia, Fishery and other Salts, Bone Dust, and every artificial manure of known value. EDWARD PURSER, Sec.
Office—40, Bridge Street, Blackfriars.

TO AGRICULTURISTS.

BONE MANURE MANUFACTORY, DRAKE'S PLACE, PLYMOUTH.

PONTEY, ROWE AND CO. beg to acquaint the Agriculturists in the West of England, that in order to insure a supply of their MURIOPHOSPHATE, which has been tested 12 years, and found far superior to all other Artificial Manures, in the continual support it yields to TURNIPS and the succeeding crops, they have made considerable purchases of BONES and BONE ASH, from South America, Hamburgh, &c., on favourable terms, They will therefore be enabled to render their Muriophosphate the same strength as heretofore, at 7l. per ton, in bags free on board; or 7l. 5s. delivered to the principal Seaports in Devon and Cornwall.

They have obtained reports of the Analysis from the most celebrated Agricultural Chemists, Messrs. Herapath, Nisbet, and Way, and they will guarantee that they supply the same article as reported on. The Analysis referred to will be open to the inspection of purchasers.

P., R. & Co. have constantly on sale BONE MANURE of their own manufacture at their Mills, at Drake's Place, which is open to purchasers. Also best PERUVIAN GUANO from A. Gibbs & Co., GYPSUM, MANURE SALT, &c., prices of which can be obtained at the Manufactory, or of Mr. PONTEY, Seedsman, Cornwall Street. 2½ per cent. off for cash on delivery.

Also London Manufactured BONE MANURE.

ARTIFICIAL MANURES, &c.—Manufacturers and others engaged in making ARTIFICIAL MANURES may obtain every necessary instruction for their economical and efficient preparation, by applying to J. C. NESBIT, F.G.S., &c., Principal of the Agricultural and Chemical College, Kennington, London. Analyses of Soils, Guanos, Superphosphates of Lime, Coprolites, &c., and Assays of Gold, Silver, and other Minerals, are executed with accuracy and dispatch.

Gentlemen desirous of receiving instructions in Chemical Analyses and Assaying, will find ample facility and accommodation at the College.

COLLEGE OF AGRICULTURE AND CHEMISTRY, AND OF PRACTICAL and GENERAL SCIENCE, 37 and 38, Lower Kennington Lane, Kennington, near London.

Principal—J. C. NESBIT, F.G.S., F.C.S., &c.

The system of studies pursued in the College comprises every branch requisite to prepare youth for the pursuits of Agriculture, Engineering, Mining, Manufactures, and the Arts; for the Naval and Military Services, and for the Universities.

Analyses and Assays of every description are promptly and accurately executed at the College. The terms and other particulars may be had on application to the Principal.

CHEMICAL ANALYSIS.

MR. H. MEDLOCK (formerly Chief Assistant in the Royal College of Chemistry) begs to inform Agriculturists that he undertakes the Analysis of Soils, Manures, &c., on moderate terms. Mr. Medlock also gives instruction to Gentlemen in Agricultural Chemistry at his private Laboratory, 20, Great Marlborough Street, London.

THE CONSULTING CHEMIST of the Royal Agricultural Society of England has removed his Laboratory to 15, Welbeck Street, Cavendish Square, where all communications and substances for analysis should in future be addressed. The Laboratory is open to Gentlemen wishing to study Agricultural Analysis, for which purpose it offers considerable advantages.

ROYAL AGRICULTURAL SOCIETY OF ENGLAND.

A LECTURE, by Professor WAY, "On the Recent Researches on the Composition of the Atmosphere in relation to Agriculture," will be delivered to the Members, at the Society's House, No. 12, Hanover Square, London, at Noon, on Wednesday, the 25th of April. By Order of the Council.

JAMES HUDSON, Secretary.

THE LANDS IMPROVEMENT COMPANY, INCORPORATED BY SPECIAL ACT OF PARLIAMENT FOR ENGLAND AND SCOTLAND.—To Landowners, the Clergy, Solicitors, Surveyors, Estate Agents, &c.—Loans may be contracted for the execution by the proprietor or by the Company of every landed improvement, especially Drainage, Building, Clearing, Enclosing, Warping, Irrigation, Embanking, Reclamation, Roads, Planting, Machinery, &c. The plans (of buildings), specifications, and estimates are prepared by the proprietors, and are submitted to the approval of the Enclosure Commissioners. Proprietors may avail themselves of the powers of the Act to recover from the inheritance their own funds to be expended on improvements. They may also apply jointly for the execution of a mutual improvement, such as a common outfall, &c. For forms of application, &c., apply to the Hon. WM. NAPIER, Managing Director, 2, Old Palace Yard, Westminster.

THE GENERAL LAND DRAINAGE AND IMPROVEMENT COMPANY

INCORPORATED BY SPECIAL ACT OF PARLIAMENT.
Offices, 52, Parliament Street, London.

DIRECTORS.

HENRY KER SEYMER, Esq., M.P., *Chairman.*
SIR JOHN V. SHELLEY, Bart., M.P., *Deputy-Chairman.*

George Thomas Clark, Esq.
John C. Cobbold, Esq., M.P.
Sir William Cubitt, F.R.S.
Henry Currie, Esq.
Thomas Edward Dicey, Esq.
William Fisher Hobbs, Esq.
Edward J. Hutchins, Esq., M.P.
Sir S. M. Peto, Bart.
William Tite, Esq., F.R.S.
William Wilshere, Esq.

Empowered to execute Drainage, Road-making, and other Land Improvements, and to Erect Farm Buildings upon Estates under Settlement, Mortgage, or otherwise; or Church property, and without investigation of Title to charge the whole outlay and expenses upon the Estate, to be repaid by instalments spread over any period determined by Landowners within the limits of 50 years for Drainage and Roads, and 31 years for Farm Buildings.

Landowners may arrange with the Company for the execution of the works by their own agents, with the use of their own or the Company's Capital. WILLIAM CLIFFORD, Sec.

CAUTION.

PARKES' STEEL DIGGING FORKS AND DRAINING TOOLS.

Whereas very inferior descriptions of Steel Digging Forks are now manufactured and sold, and I have been informed that purchasers of the same have believed them to be the same as those manufactured by me, and to which the Royal Agricultural Society and numerous Agricultural Societies' prizes have been awarded, I hereby respectfully inform the public that every Fork manufactured by me is stamped with my trade mark "J. P.," and that Messrs. BURGESS & KEY, of No. 103, Newgate Street, London, are my sole Wholesale Agents, and I have authorised them to replace to the purchaser every Fork of my manufacture found defective; they will also on application send Wholesale and Retail Price Lists, &c., post free. FRANCIS PARKES & Co.

ESTABLISHED ABOUT HALF A CENTURY.

AGRICULTURAL SEEDS OF THE FINEST SELECTED STOCKS.—*As the quantity of Mangold, some of the Turnips, &c., are found not so scarce on the market as was expected at the close of harvest, we submit our present prices, in which several will be found lower than quoted in our Spring Catalogue.*

	Per lb.—s.	d.		Per lb.—s.	d.
Mangold Wurzel, Long Red	0	8	Turnip White Decanter, or Norfolk Bell ...	1	2
„ „ Long Yellow	1	0	„ Green Barach ...	1	2
„ „ Yellow Globe	0	8	„ White Tankard ...	0	10
„ „ Red Globe ...	0	9	„ Red Tankard ...	0	10
Carrot, Long White Belgian	2	0	„ Yellow Tankard ...	2	0
Turnips, fine Purple Top	1	9	„ Orange Jelly ...	1	4
„ fine Green Top ...	1	9	„ Purple Top Bullock	1	0
„ Skirving's	1	9	Cabbage, large Drumhead	2	6
„ Laing's Purple Top	1	0	„ Kohl Rabi ...	2	6
„ Norfolk White Round	0	9	Lucerne	1	0
„ „ Green Round	0	9	Furze or Gorse	1	0
„ Lincolnshire Red Globe	1	2	Alsike Clover	2	0
„ Pomeranian White Globe	1	2	Bokhara Clover	2	6

PERMANENT PASTURE AND OTHER GRASSES.—Our Mixtures for Permanent Pastures will be found equal to any which are supplied. Prices per acre, according to the nature of the soil, 24s. to 34s. Wholesale Prices of Grasses and other Seeds to the trade on application.

Finest Mixed Lawn Grasses, per lb. 1s., or 4s. 6d. per peck.

☞ GOODS CARRIAGE FREE (not under 20s.) to all the London termini, or any station on the Colchester and Norwich line.

BASS AND BROWN, Seed Establishment, Sudbury, Suffolk.

GRASS AND AGRICULTURAL SEEDS.

THOMAS GIBBS AND CO., the SEEDSMEN to the Royal Agricultural Society of England, beg to inform their friends and agriculturists generally that they are now prepared to supply the undermentioned in any quantities required.

Mixtures of Grass Seeds for laying down land to permanent Pasture and Meadow; Irrigation or Water Meadow Mixtures; Upland Sheep Walk Mixtures; Park and Field Lawn Mixtures; Renovating Mixtures for old Swards; Garden, Lawn, or Grass-plot Mixtures; various Permanent Grass Seeds supplied separately to order; Mixtures for one year's lay, do. for two or three years' lay (commonly called "seeds").

CLOVERS.—Red or broad leaved, white or Dutch, Red Suckling, Alsike or Hybrid, Trefoil, Cow Grass or Perennial.

RYE-GRASSES.—Italian (very fine), Annual, improved Perennial, and other kinds.

CARROTS.—Large White Belgian, large field Altringham, Yellow Belgian, long Orange or Surrey.

PARSNIPS.—Gibbs' large Guernsey Cattle, common large.

MANGOLD WURZELS.—Long Red, Orange or Yellow Globe, Red Globe, long Yellow.

CABBAGES.—Large Drumhead Cattle, Thousand headed.

TURNIPS.—Purple-top Swedes, Green-top Swedes, Skirving's Swedes, Green-top Yellow Hybrid, Red-top Yellow Hybrid, Globes or Rounds, Tankard's sorts, Kohl Rabi.

Lucerne, Broom, Furze or Gorse, Field Parsley, Rape, Seed Barley sorts, Wheat sorts, Rye, Sainfoin, Tares, White Mustard, White Silesian Beet, Peas, Potatoes, and all other seeds for the farm.

KITCHEN GARDEN AND FLOWER SEEDS, including all the new and most approved varieties. Assortments made up to suit different sized gardens, or to any given amount.

Priced Lists of both Agricultural and Garden Seeds sent free by post on application to THOMAS GIBBS & Co., Corner of Half-Moon Street, Piccadilly, London.

MEADOW AND PASTURE GRASS SEEDS.

GEORGE GIBBS AND Co., 26, Down Street, Piccadilly, beg to announce that their Mixtures of Grass Seeds are now ready for delivery at the following prices:—

Mixtures for laying Land down to permanent Grass, for light, heavy, and other soils (allowing 2 bushels and 12 lbs. to the acre) ... ... 30s. per acre.
Mixtures for Park or Field Lawns (allowing 2 bushels and 12 lbs. to the acre) ... ... 32s. per acre.
Mixtures for improving and renovating old Grass Land, 1s. per lb.
Mixtures (finest sorts) for forming Lawns... ... 1s. 3d. per lb.

These Seeds are all new, and have all been properly cleaned and their growing properties fully tested. Directions for sowing accompany the seed.

G. G. and Co.'s New Priced AGRICULTURAL CATALOGUE is now ready, and will be forwarded free on application.

GEORGE GIBBS & CO., SEEDSMEN,
26, Down Street, Piccadilly, London.

AGRICULTURAL SEEDS,
MEADOW & PASTURE GRASSES, &c.

PETER LAWSON AND SON, of Edinburgh and London, the QUEEN'S SEEDSMEN, NURSERYMEN, and WOOD FORESTERS; and to the HIGHLAND AND AGRICULTURAL SOCIETY OF SCOTLAND, beg to intimate to their English Customers and the Public that they are now sending out FARM SEEDS of every description, saved from genuine stocks, and for which they respectfully solicit orders.

Also Garden Seeds, Flower Seeds, Garden Implements, Draining Tools, and everything connected with their trade. Catalogues will be sent on application.

London Branch, 27, Great George Street, Westminster.

P. L. & S. are always able to recommend experienced Bailiffs, Gardeners, and Foresters.

SPECIAL CONTRACTS FOR SEEDS.—*Noblemen, Clergymen, or Yeomen requiring large quantities, special contracts will be made, at a great reduction in price, on application to*
WILLIAM E. RENDLE & Co., Seed Merchants, Plymouth.

SUTTON'S LARGE YELLOW GLOBE MANGOLD WURZEL, FROM SELECTED ROOTS, QUITE HARDY.—Seed of this fine large Mangold Wurzel may be obtained genuine of Messrs. SUTTON, price 1s. per lb., or 5l. per cwt.; other sorts cheaper. Early orders are requested and recommended, as the stock is limited.—Address,
JOHN SUTTON & SONS, Seed Growers, Reading, Berks.

The Agricultural Gazette.

SATURDAY, APRIL 21, 1855.

MEETINGS FOR THE ENSUING WEEK.

WEDNESDAY, April 25 { —Agricultural Society of England—Professor Way's Lecture.

THE sales of short-horns next week will make it probably the most remarkable of the year in that respect. Mr. WETHERELL of Durham has two sales and Mr. STRAFFORD three. The Hendon sale on Tuesday to which we referred last week will be followed on Wednesday by a sale of 40 pure bred short-horns from Mr. AMBLER's herd at Watkinson Hall farm, near Halifax, Yorkshire, and on Friday by the auction at Springfield Hall, near Lancaster, when the whole of the herd of the late JOHN

Bolden, Esq., will be submitted without reserve to public competition. Mr. Bolden was a cotemporary of the Collings, and his cattle have been bred chiefly from the herds of Messrs. Bates and Booth. Mr. Ambler's stock is descended from the herds of the Earl of Carlisle, Earl Ducie, and Earl Spencer, and those of Messrs. Bates, Bolden, Booth, Fawkes, Maynard, Tanqueray, Towneley, and others. And we may mention in reference to Mr. Tanqueray's herd, what was omitted last week, that a good portion of the young stock are by the best bulls in the country, namely Duke of Glo'ster and 5th Duke of York.

The idea of a Steam-Rasp for grating down the soil into a fine seed-bed, first enunciated by Mr. Hoskyns in these columns, has been adopted by numerous inventors, so that something of the sort may be expected at Carlisle. Wishing to prepare the agricultural public for the novelties likely to compete for the 200*l.* prize, we would direct attention to the practical objections weighing against some of them.

The theory of the operation of minute and deep pulverisation we leave for future consideration; merely observing that it may be useful for preparing ground for certain kinds of cropping, and at some distant time, when the action of the atmosphere upon fine particles of earth is better understood than at present, may be proved profitable and effectual as a means of fertilisation. But as yet the crops raised from our land seem unable to repay any very costly operation; and it may, therefore, lead to future success if steam power shall first perform something more like present processes. And we believe that Mr. Hoskyns himself—taking into account the necessity for an exposure of the soil in rough clods at some seasons, the spontaneous crumbling of such clods which occurs at others, together with the frequent cleansings from root-weeds which must be provided for—is prepared to welcome any modification of the rotatory rasp capable of tilling heavy land more efficiently than the plough.

What is the general expectation with regard to a successful steam-cultivator? Why, that it will effect the ordinary tillage of our fields—in an improved manner it may be—with greater cheapness and expedition than at present. The earliest idea awakened by the advent of a steam-plough was the extravagant supposition that land would be now prepared in hours instead of days; and we still consider that no invention will answer which does not include economy of time among its advantages. Can a farmer be expected to sell off the most of his teams for the sake of substituting an engine, unless the latter will facilitate the breaking-up of his Turnip land or stubble for spring corn, proceed with unprecedented dispatch in autumn cleaning, and prepare a seed-bed for Wheat or any other crop in double quick time? No data exist by which we can foretell the amount of work due from a steam-rasp; but the very nature of the process of grating or scratching necessitates either an enormous expenditure of power, or a tediously slow rate of performance. One of the most carefully studied inventions of this kind is calculated (according to the specification) to till, with a powerful engine, about 200 square yards per hour, or only 1 acre a day. Mr. Mechi, after constructing and testing one of these mincing or powdering machines, has concluded that the process is altogether impracticable; and that the soil must be dealt with in masses larger than mere dust, and must be cut and raised by a slow, steady motion.

A steam digging machine has been invented in Germany; the power required for all its motions has been ascertained from experiments, and every detail corrected by calculation; and the patentee estimates that the strongest engine which can be efficiently employed in spite of its weight will dig to the depth of 1 foot not more than $1\frac{1}{4}$ acre per day on the average quality of cultivated land. Mr. Usher's steam plough in 1852, according to Professor Wilson, broke up no less than 7 acres per day, the cost of working being only 2*s.* 6*d.* an acre; and though the style and depth of its work may have been far inferior to that made by the German engine, this rapid rate of labour is far more likely to get the farmer's patronage. Our advice to inventors is: however ingeniously you may pulverise, dig, or plough; however perfectly you may accomplish any of the heavier labours of tillage; you must work *economically*, and promise *a saving* to the husbandman, before you can reap success.

I. A. C.

We lately saw the works at Belleisle, near King's Cross, where the Nitro-phosphate, or Blood Manure Company, at present manufacture their fertiliser until their works in Plaistow Marshes are completed. And as blood is used now by several companies advertising in our columns, such as the London Manure Company, the late Manchester Sewage Manure Company, and the Cyanic Manure Company, we may refer to the operation of the last as characteristic, if not of the process as employed by all, at least of the value now set upon a substance most of which used generally to be wasted.

The manner in which it is used at Belleisle is as follows:—Bone-dust and crushed coprolites are placed in a long tub, along the central axis of which is the shaft of a revolving agitator—so many casks full of blood are poured in over the bones and well mixed by the arms upon the working shaft. Sulphuric acid is added to the mixture, which boils and effervesces under the action of the vitriol on the bones and blood, and after thorough commixture for about 10 minutes the liquid mass is allowed to escape through the opened end of the vessel, and it runs in a heap upon the earthen floor, where, as it cools, it hardens and dries. Some 16 or 18 large vessels full of this mixture are thus poured out in the course of the day, forming at the end of it a large mass of probably 40 or 50 tons of manure. It soon hardens, and in a day or two is turned over with the spade and broken small, and is found already dry enough for drilling. This is the Turnip manure of the Nitro-phosphate Company. In their Wheat manure the same materials are used in different proportions, and a larger quantity of blood being used artificial heat is needed to dry the resulting compound. The Turnip manure contains about 2 or 3 per cent. of nitrogen along with 16 per cent. of soluble phosphate of lime; the Wheat manure contains about 7 per cent. of nitrogen and the phosphate is reduced to 10 per cent. The proportion of ingredients needed to produce these results we have, of course, no right to publish, as it is on the determination of these that the relative merits of the plans adopted by the different companies depend. Several thousand gallons of blood are daily using now at Belleisle, and at the works of the other companies which use it very large quantities are being also turned to agricultural uses; so that this may be considered one of the most prolific of the home sources from which the enormous agricultural demand for manure is now supplied.

How rapid the growth of this demand has been appears in the history of the London Manure Company, which sells about 10,000 tons annually of manures of all sorts, and which, from 3 tons of guano in the first year of its formation (sold at 26*l.* per ton), has risen in its transactions to the quantity of 3000 tons, sold last year.

The great room for extension of the manure trade appears also in the number of companies which have latterly engaged in it. To some of these companies we have referred in past numbers of this Paper. The substance manufactured by one of them—the British Economical Manure Company—was fully described in last year's volume from analyses by some of our best chemists, and readers of this Paper were warned both from the recorded experience of those who had used it, and from the recorded opinions of our best writers on the food of plants that the substance was neither worth the sum demanded for it, nor calculated to do the good which it pretended. We regret to find that a repetition of this warning is required, and that the sale of a substance little calculated to be useful is being pushed in Scotland as well as England in spite of the abundant evidence which exists of its low agricultural value.

FARM NEAR CHELMSFORD.

In giving the system of cultivation in detail as carried out upon this farm, we wish to be understood that it is not from any conceit we entertain upon our own management, but rather to convey to your readers at a distance the system pursued, the state of the weather, and the prospects of farming at the particular period at which we are writing, that they may be able to compare notes and ascertain what is our position relatively with their own.

Upon the 18th January we put in 12 acres of Barley upon a light soil, and had purposed upon the following days to have put in a still larger quantity. Upon the 19th, however, rain fell, and upon the succeeding night considerable frost followed, which continued with unusual severity until the 26th of February following, when a rapid thaw took place. During the period alluded to snow fell on two occasions to considerable depth, but which immediately was blown into drifts, filling the roads, and laying the fields bare. The unusual severity of the weather destroyed the white common Turnips entirely, as well as most of the green hardy varieties. The Swedes also exposed were so greatly injured as to become of little value, and the Mangold Wurzel, Potatoes, &c., not well secured by a more than ordinary covering of earth became frozen and spoiled, and to such an extent that the keeping of stock has been since attended with unusual difficulty and expense, and sheep and lambs, as well as hoggets, have fallen greatly in price, the best couples not producing more than 42*s.*, whilst the largest proportion have not realised more than 35*s.*

The frost upon several nights was so severe that the thermometer marked only 3° or 4° above zero, and upon one particular night, the 9th February, in some situations fell to that point, consequently much damage has ensued to crops upon the ground of every description, and most of our tender description of evergreens are destroyed. Even the common Furze is killed to a great extent, and Rye upon our driest description of land is also partially destroyed by the unusual severity of the weather upon portions of the field from whence the snow was blown away.

We had remarked upon the effect of the weather upon the young plants of Wheat before your observations appeared, but we have since made a particular examination, and find that great deficiency of plant is found upon all those pieces of a light gravelly character, or upon other descriptions of soil where not sufficiently consolidated. We feel assured that in most cases the loss of plant is attributable to the effect of frost, as upon this farm two instances occur proving it beyond all doubt; in one a field that had been sown down with Red Clover, and which failed in the spring of 1854, 7 acres upon one side, and 2 acres upon the other, were ploughed up, leaving about 12 acres in the middle in Clover, which was mown twice and a portion three times for foddering. The whole was manured and also drilled the same day in the same manner, and came up together a full plant; the two sides succeeding Oats and Potatoes are now an excellent plant, but much of the plant is destroyed upon the portion that had been Clover and upon which the land remains in a porous state. This proves that it was not to the mineral solution of vermin that was employed in dressing the Wheat that the deficiency is attributable; and if we may be allowed to venture an opinion we shall at once state that we believe the extraordinary dry season that attacked the Wheat sowing, succeeded as it was by a continuation of dry weather until the frost set in, did not produce the usual consolidation of the soil, except upon such portions as had been reduced by tillage to a depth of mould which readily closed round the grains of Wheat; and as the protection by the snow ceased, except upon such portions to which it was drifted and accumulated, those portions as well as the sheltered end of the field, remaining for the most part uninjured. In the early part of this notice we stated that a field of Barley was drilled in January—the field was much exposed, and was divested of the snow—but the severity of the weather led us to expect such a deficiency of plant that we were induced about three weeks since to drill an additional quantity of seed upon the field that the whole might become ripened together; this precaution became more necessary on account of the onslaught upon the field by flocks of rooks from all quarters, and more especially from a neighbouring rookery, where they are protected and encouraged to such an extent to become one of the greatest pests we have ever had to contend with, it having cost us upwards of 10*s.* per week from that period to the present time to protect our crops from their depredations. Rooks, it is true, may sometimes be beneficial in destroying grubs, but under the altered state of society their assistance would now be gladly dispensed with; these black-feathered gentry never feed upon insects if they can procure grain, and are always prone to reap that which they have not sown. The carrying on war against them also, if not so expensive as that before Sebastopol, is equally harassing to the farmer.

Upon the 1st and 2d days of the current month the Barley referred to began to make its appearance above ground, and is now about two-thirds of a full plant upon all those portions of the field protected from the depredations of the vermin referred to, proving that even Barley will stand considerable frost without injury, if the land is well pulverised and the weather succeeding its being sown remains dry. This is corroborated as regards Wheat. A portion of Turnip seed was put in early in January, and has come up since the frost plentifully, and remains excellent and vigorous in plant. Talavera Wheat, also sown in the last week in February, has also come up, and appears a full and healthy plant. Upon the whole we are quite satisfied with the appearance of the young Wheat, not only upon this farm, but also generally throughout this district, and upon the heavy land portion of this county we hear that it has planted unusually well.

A large portion of winter Beans were put in throughout this district, and the plant before the frost set in was excellent; those upon this farm, sown on the 16th October, were mostly killed by it, and the land is now ploughed in preparation for Turnips and Cabbages. We learn that most other persons have lost their plant not only of the winter variety, but also of those sown early in the spring, and a large breadth has necessarily been resown. Peas have, on the contrary, succeeded beyond expectation, where not sown too early in November as to have become advanced into leaf before the winter had set in.

As regards our spring sowing, consisting of Barley and Oats, that has been long completed, unless where Turnips and Rape have not been fed off sufficiently early; but we have had such continual frost at night and such drying winds by day, that it would not be now safe to sow until rain falls, the land at the present moment having become so dry that the land drainers are impeded in their progress; the consequence is, that our land (about 30 acres), prepared for Mangold Wurzel, is all manured, subsoiled, ploughed, and rolled.

ready to receive the seed which will be put in during the current week, and which will be the more important as some of the Cabbage seed sown has, owing to the cold dry state of the atmosphere, at present vegetated. We have within the last few days put in our Potatoes, and to secure them from disease have dressed the rills of the land copiously with an admixture of lime and salt; to this we add about 3 or 4 cwt. of fishery salt per acre, which, of all the various applications made by us last season for that purpose, succeeded better than any other, and such was the effect upon the haulm of the Potato plants when growing that it became several shades darker in colour, and remained untouched by disease throughout to the time of taking up the bulbs, which were also very clear and free from canker.

Our early description of Rye is progressing rapidly, and should rain succeed we shall commence mowing it by the 24th; this operation we have endeavoured to facilitate by sowing from 2 to 3 cwt. of guano per acre, but which the recent dry weather must have to a great extent evaporated.

We are now, in sailor's phrase, on our "beam ends" to know how to provide for our neat stock, horses, and sheep. Hay is purchased at 4*l.* 10*s.* per ton; Grain at 3*s.* per quarter; Turnips and Mangold at 17*s.* to 20*s.* per ton; Clover-hay, 100*s.* to 120*s.* per ton. Most of this has now to be purchased, and with the number to be supplied the expense is alarming, and we have long said good bye to profit for this season.

EFFECT OF TEMPERATURE ON DAIRY PRODUCE.

[Our correspondent "Y" has sent us a paper on this subject the first part of which he had contributed to the useful magazine published in connection with the Albert Training School, but additions to which have been made by him in the following article.]

The dairy practice in this locality is directed to the sale of new milk and of butter and skimmed milk. The price of new milk is nearly uniform, being 2*d.* per quart, that of butter is sometimes as low as 1*s.* per roll of 24 oz., and sometimes nearly double this. The price of skimmed milk is likewise steady, being generally 1*d.* per quart. The cause of the fluctuation in the price of butter, with steadiness of price in that of milk, will be found in the comparative ease of the transport of the one as compared with the other; the former is liable to damage by moving, whilst the latter is regularly brought to market by sea and land, hundreds of miles. Butter is brought from Mecklenburg and from the west of Ireland to London. It will then be obvious that the supply of new milk is limited to populous districts, or to such as have gained easy access to them by the introduction of railways. It is in some measure optional in what state my dairy produce is disposed of—in new milk, or in butter and skimmed milk. In giving attention to this branch of farm economy, I was led at an early period to inquire at what price the two processes afforded a like return. After several trials made during warm weather, my cows being on Grass, I found 16 quarts of milk yielded 26 ounces of butter; the quantity of cream varies with the skill or taste of the dairy-maid in skimming the milk, and in proportion as she mixes milk with the cream. I have frequently found a quart of cream to give 14 to 16 oz. of butter, and this is about the average from the cream used for the trial cheeses at the Royal Agricultural Shows. I have, however, latterly, since December, 1854, found my cream much richer, and am obtaining 22 to 24 ozs. of butter from each quart of cream. I can only attribute this to the quality of the food in which Rape-cake and Bran, materials rich in oil, are components; the production of butter is, however, little influenced, being about 26 to 27 ozs. from 16 quarts of milk. The comparison will be—

16 quarts of new milk, at 2*d.* per quart		2*s.* 8*d.*
16 quarts of milk give a roll of butter of 25* oz., at	1*s.* 6*d.*	2*s.* 8½*d.*
14½ quarts skimmed milk, at 1*d.*	1*s.* 2½*d.*	

(The butter milk covers cost of churning.)

Butter is sold here by the roll of 24 ounces; it is customary to make up the roll to weigh 25 ounces, the odd one being in favour of the purchaser. I thus find an equal gain from new milk sold at 2*d.* per quart, as from butter at 1*s.* 6*d.* per roll, and skimmed milk at 1*d.* per quart. It will scarcely be necessary to observe that with a rise in price above 1*s.* 6*d.* per roll, it is my interest to direct my dairy produce more to butter, whilst with a lower price new milk pays better. In the course of a season or two, and towards the close of a year (date in November), I remarked a considerable falling off in my receipts for the dairy; and as no change had occurred in the number or circumstances of my cows, nor in their food, I was led to inquire into its cause. I found an equal quantity of milk had been brought down to the dairy-maid, a like sum received for new milk, and that the deficiency arose solely from a less quantity of butter. With this change there had occurred a great change in the weather, it having become very cold and frosty. I again tested the quantity of milk, and found the yield of butter 16 ounces from 16 quarts, instead of 26 ounces, as on the former trials: up to this time I had used an under-ground cellar in summer, and a room on the ground floor in winter, during which time this deficiency in my butter occurred. This room is situated on the north side of the house, the in-door opening into my kitchen, where the culinary operations are carried on, and which door was usually kept close by day as well as by night; the room is lighted and ventilated by a trellis window, which gave free access to the frost and cold air. On trying the temperature I found it something below 40°; it then occurred to me that the deficiency of butter must arise from the too low temperature of my dairy, and an easy means of remedy at once suggested itself, namely:—to introduce with a supply of fresh or cold water a supply of hot water, by an apparatus for that purpose. It so happened that the pipes for both hot and cold water passed through my dairy, immediately under the trellis window, and over the stone table on which my milk bowls are placed. This table is about 2 feet in width, and occupies one side and the end of the dairy in which is the trellis window. I ordered a shallow open cistern to be made of wood, with a rim about 3 inches along each side, and lined with thin sheet lead; this cistern thus contained water of 3 inches in depth. At its extremity, and near the window, is a hollow plug, having perforated holes near 3 inches above the bottom, and through which the water escapes as it rises into the common sewer. At the same end of the table, and inside the rim, is a pipe which, being inserted into the one from the hot water apparatus, conducts this to a tap at the other extremity, and then returns along the other side of the table again to the hot water pipe; when the new milk is brought in it is set up warm, and immediately the hot water tap is turned, when the water flows from it and along the cistern, in which the full milk bowls are standing, till it rises to the height of the holes perforated in the tube, and then flows through the same. The tap is open so long as the supply of hot water lasts; when this is exhausted, and the water in the cistern has cooled, the plug is drawn, and the whole of the water escapes, leaving the cistern empty. At this season the trellis window is closed by a wooden shutter, and the in-door communicating with my kitchen is kept open. By these contrivances my dairy attains a temperature in winter of 53° to 55°. I superintended the experiment when first tried one evening. The next morning my dairy-maid thus accosted me:—"Master, it is quite wonderful this morning; I have more cream from standing one meal (12 hours) than before from three." When the churning day came the result was a yield of butter of 26 ounces from 16 quarts of new milk, being equal to what I had found in summer. Thus from a change of temperature solely, and without any change of cows, or in their food, my quantity of butter was increased 50 per cent. But this is not the only advantage of the plan: I have already remarked that along with the hot water pipe, one with cold water passed through my dairy. At the approach of summer a pipe inserted into this with a tap close by that of hot water is turned, allowing the cold water to circulate in the like manner among the bowls of milk, till the cistern is filled to near 3 inches deep, when it again escapes through the perforated tube. This operation is continued through the hot weeks of summer, the tap being regulated so as to discharge a constant trickling of cold water, which is of course escaping through the tube at the other extremity, the milk bowls standing in water of the depth of near three inches during the whole of the summer season. I am thus enabled to allow my milk to remain two or three meals (24 to 36 hours) without becoming sour, and can sell it at the price stated, 1*d.* per quart. The advantage I gain from this is even greater than what I derive from the increased temperature during winter. These arrangements have been in operation for several years, during which I have occasionally tested the yield of butter, and have always found it similar, varying only from 25 to 27 ounces from 16 quarts of milk, the greatest amount being observed in the month of December last, when it was found to be fully 27¼ oz. from 16 quarts. I may here remark that my milch cows are supplied in summer and in winter with food suited to their wants, and to the office they are performing—the production of wholesome and nutritive milk.

Since I adopted this mode of regulating the temperature of my dairy, I have read a lecture given before the Royal Society by Captain Carr, an English gentleman, who resides on an estate which he has acquired in Mecklenburg, in which country the attention of farmers is chiefly directed to the production of butter, which is their main source of money returns, and where, as appears from Captain Carr's description, the arrangements of the dairy, with regard to the production of butter, are carried out with the greatest perfection, and in which regulation of the temperature is one of the chief aims. Captain Carr states that by artificial heat they effect a temperature during winter of 60°. Now, with my present means, I am not able to attain more than 52° to 55°, but as I have not during summer, when the temperature of my dairy sometimes exceeds 60°, found a great proportionate yield of butter, I am led to conclude that the degree of temperature I have stated, 52° to 55°, enables me to acquire the whole of the butter which the milk contains.

Since the foregoing remarks were penned, I have had another opportunity of observing the effects of a lower temperature on the yield of butter. During the keen frost of February my main water-pipes, though laid more than two feet under ground, were reached by the frost, and my supply of water completely stopped. My mode of increasing the temperature by hot water was suspended. The thermometer in the dairy denoted 45°. My yield of butter was again tested, and found to be about 20 oz. from 16 quarts, or for every four rolls of butter, with a temperature of 55°, I had only three rolls from a like quantity of milk, with a temperature of 45°. I now noticed a current of cold air from the crevices along the side of the wooden shutter placed inside the trellis window, of sufficient force to extinguish a lighted candle when held near it; I therefore caused another shutter to be fastened to the outside of the trellis, with a space of 4 inches between, which space I packed closely with straw. From this simple inexpensive contrivance, aided by the fire from the adjoining kitchen, the temperature of my dairy rose to 50°; the amount of the outlay was more than compensated by the increase of butter from the first churning. My observations on dairy husbandry tend to the following conclusions:—

That on a range of dairy cows of similar breed in different stages, some with a full yield of milk, and others with a less quantity or longer after calving, supplied with suitable food and with no excess of watery element, the composition of the milk will be uniform, or nearly so, as far as regards the production of butter, and probably as regards that of casein and other components. That the quality of the cream varies considerably without influencing the comparative yield of butter from a like quantity of milk.

That the proper adjustment of the temperature is of the greatest importance on the comparative production of butter. By a series of carefully conducted experiments at varying temperatures, I am of opinion that a correct scale of the comparative yield of butter at different temperatures might be arrived at. The following may be taken as an approximate to what the result would be:—From a very low degree of temperature, little or no butter; from a temperature of about 38°, 16 oz. from 16 quarts of milk; ditto 45°, 21 oz. from 16 quarts of milk; ditto 55°, 26 to 27 oz. from 16 quarts. 18 quarts 1 gill of cream churned on the 12th of March yielded 450 oz. of butter, nearly 25 oz. per quart; temperature of dairy 50°, without appliance of hot water. On perusing several treatises on dairy produce I find the proportion to range from 12 oz. to 16 oz. of butter from a quart of cream; what I now state appears nearly double the ordinary proportion. *Y.*

* My experiments show 26 ounces.

Home Correspondence.

A North Country Farmer's Opinion of Italian Rye-grass.—In a report dated June 27, 1854, from Inverness-shire, published in the columns of your contemporary, *the North British Agriculturist*, appears the following testimony to the value of Italian Rye-grass, regarding which there seems to exist a wide difference of opinion at present:—"We have experience this year of the benefit to be derived from increasing the usual quantity of Clover seed, and decreasing the Rye grass seed—15 lbs. Red Clover and ¼ bushel of Italian Rye-grass seeds per imperial acre have given a most satisfactory result. The Italian Rye-grass seems to possess great capacity for shooting out when thin sown, for we plucked up a single root from which sprang 50 stems, each approaching to 4 ft. in length." The field, a clayey loam, was in Swedish Turnips in 1852, the manure being dissolved bones, the crop fair, say about 18 tons per acre; the crop of 1853 was Wheat, which turned out badly, nitrogen being apparently deficient for this ammonia-consuming crop. Top-dressed in May, 1854, with 1½ cwt. Peruvian Guano, it afforded 3 heavy cuttings by September, the Red Clover being thick, while the Italian Rye-grass each time rose above it at least 6 inches. *S.*

Steam Cultivation v. *Ploughing.*—We are waiting with eagerness to see what the prize offered for steam cultivators will bring forth, and our expectations waver between hope and fear. If it is successful, which we of course hardly expect at first, it will soon cause a change of no ordinary importance; but if it is far from successful, then we may have to wait for some time before we derive any advantage from it. My object in writing this is to call attention to what I think a mistake into which some of its warmest advocates have fallen—I mean those who go on the assumption that it must be applied only to circular or rotatory cultivation. Now it is true that steam must be first applied in producing revolution, but it does not by any means follow that that revolution may not be converted into a draught power. Do we not see it drawing the carriages on the railway? They run on wheels; but though they were as many sledges, could not the same power be applied to them? It is no doubt delightful to anticipate a field being operated on by a huge scratcher, which at one operation converts it into a vast flower bed; but this is easier said than done. I think it must be allowed that the form of our best ploughs being on the wedge principle require the lightest draught. What is more powerful than the wedge? what less likely to suffer damage from hard resisting substances? It will split stones and timber without being damaged; but what power and strength of materials will it not require to tear or scratch such substances apart. But apart from what I think the impossibility of any substances being strong enough to stand such wear and tear, I think there will be in employing it a great misdirection of power. Not only will the final resistance be great, but the motive power is at the wrong end of the lever, as the speed must be multiplied greatly, and then the chief resistance is at the point of the prongs, so that to carry any breadth to a proper depth, the power must be heavy; whereas the great desideratum seems to be a an efficient light engine. The steam engine has indeed become a giant, but even then it may be overworked. But suppose we can get all this done—though the hardest clays and most stubborn subsoils can be torn to pieces and the field converted into one vast mole heap—do we

want that? We are often told that farm practice must approach more and more to garden practice. But is it the gardener's wish to convert his beds into the finest possible tilth at once? Certainly not; his object is to turn it up as roughly as possible in the autumn; he must have it in ridges, so that the frost can get at it—all ploughing is ridging on a small scale—and it is only when he comes to sow that he wants the fine bed. And is not that what we want? Who would think of working his land allotted for Turnips into a fine tilth in autumn, and leaving it so all the winter? And who wishes to have their Wheat too finely pulverised? The only time that we could use such an implement with advantage would be for spring ploughing and sowing. I fear some of our inventors, if they do not consider the subject again, are likely to defeat their object by trying to give us what we do not want, and that too at a great sacrifice of power. I think they will do best to keep to the plough, however old it may be, and if they can, as "I. A. C." says, pull it well, by the same means we can pull any other field implement. And that we shall sooner or later see steam successfully applied to cultivation I have no doubt; but that it may be delayed by attempting too much with it I have some fear. However, a few months will now inform us whereabout we stand. *S.*

Sand Drainage.—An "Aged Practical Observer" asks, on April 7th, "Can you keep tree roots out of pipe drains, or any drains whatever?" That question, I think, can be satisfactorily answered. By observing and imitating nature, a drain can be formed cheaply to last for ever, that roots of any description shall not choke. Where natural drainage takes place it is by seams of sand or gravel; now, by cutting a drain in the usual fashion, and filling in six or eight inches of pure sand, river sand if possible, and covering in over this, you have a drain that is permanent—in fact, everlasting if undisturbed; for although tree or other roots may run through it, the sand can never be so displaced as to affect the drainage in any sensible degree. I have often wondered why sand drainage is never used, being so cheap and so permanent. *J. L., M. D., Newburgh, Fife.*

Societies.

ROYAL AGRICULTURAL OF ENGLAND.

Special Monthly Council (after the Easter recess), *April* 18. Mr. Miles, M.P., President, in the Chair.

Finances.—Mr. Raymond Barker, Chairman of the Finance Committee, laid before the Council the monthly report on the accounts of the Society, and the usual quarterly statements for the information of the members. He also reported the current cash-balance in the hands of the bankers as 3239*l.*

Prize-Essay.—The President reported from the Journal Committee the following awards already made by the Judges of Essays and Reports:

I. To Clare Sewell Read, of Plumstead, near Norwich: the Prize of Fifty Sovereigns, for the best Report on the Farming of Buckinghamshire.

II. To Henry Evershed, of Albury, near Guildford: the Prize of Fifty Sovereigns, for the best Report on the Farming of Warwickshire.

III. To John Coleman, of Deene, near Wansford, Northamptonshire: the Prize of Forty Sovereigns, for the best Essay on the causes of Fertility and Barrenness in Soils, so far as observation and science have hitherto enabled them to be ascertained.

IV. To Isaac Seaman, Veterinary Surgeon, Saffron Walden, Essex, for the best account of the Nature and Treatment of Lameness in Sheep and Lambs.

The President further reported that the judges had decided that none of the essays sent in to compete for the prize of 20*l.* for the best Essay on the Prevention of Mildew in Corn Crops, possessed sufficient merit for that prize; that one of the essays in the class of Lameness in Sheep and Lambs was excluded from competition on account of its not having been sent in until after the 1st of March; and that adjudications still remained to be made in five other classes of essays than those in which decisions had been announced.

Guano Supply.—The President reported from the Guano Supply Committee that several communications had been received from the Foreign Office, through Lord Wodehouse, since their previous meeting, containing further information of the discovery of new supplies of guano, and assurances that every means would be taken by the Earl of Clarendon to obtain for the farmers of this country as full a participation in the benefits of such discoveries as might be conceded by the respective states within whose territories the guano deposits occurred to the farmers of other countries.

Carlisle Meeting.—Mr. Fisher Hobbs, Vice-Chairman of the General Carlisle Committee, reported the gradual progress of the works for the Carlisle Meeting at the end of July next, and the favourable manner in which the railway companies had received the application of the Council for the concessions they had hitherto so liberally granted to the Society's exhibitions in the transit of their live stock and agricultural implements and machinery.

Steam-power Conditions.—Colonel Challoner, Chairman of the Implement Committee, reported the following results connected with inquiries relating to the conditions of the Implement Prize-sheet for the Carlisle Meeting:

1. Steam-engines worked on the expansive principle will be allowed an expansive valve, worked by a simple excentric, in addition to the ordinary slide-valve, so long as worked under one fixed rate of expansion, and divested of all complicated arrangements intended to vary the rate of expansion.
2. The *true* velocity which each exhibitor of a steam-engine considers best for his particular engine must be stated and adhered to by him in each case—no indefinite, varying, or average statement of velocity being allowed.
3. The attention of the Stewards and Judges will hereafter be particularly called to the clause—"That no force-pump must be fitted with more than two valves, which must be of easy access;" and a special note on the same point will be forwarded to the honorary director of the Show.
4. The Society will not undertake to find the *motive power* for working the Steam-cultivators competing for the Society's Prize of 200*l.* at the Carlisle Meeting.

Ages of Pigs.—Mr. Barnett, Chairman of the Age of Pigs' Committee, submitted to the Council the following report (which was also adopted and confirmed).

1. That all pigs exhibited at the Carlisle Meeting shall be subjected to their mouths being examined by the Veterinary Inspector of the Society.
2. That should the state of the dentition of any pig indicate that its age has not been correctly returned in the Certificate, the Stewards shall disqualify such pig, and shall report the circumstance to the next Monthly Council.
3. That Prof. Simonds shall be authorised to call in an assistant if required; but that the Professor shall be responsible for the correctness of the opinions given; and that the remuneration to be paid to such assistant shall this year not exceed 10 guineas.

Country Meeting of 1856.—A memorial was received, through Mr. Fisher Hobbs, from Mr. Parker, the chairman of a country meeting held at Chelmsford on the 16th inst., inviting the Society to hold its Country Meeting of 1856 in that town, the centre of a purely agricultural county, which comprises upwards of a million of acres of land and nearly half a million of inhabitants, and where every local circumstances would be found to be most favourable for the promotion of the objects of the Society.—Mr. Raymond Barker and Mr. Brandreth Gibbs were requested to form an Inspecting Committee for the purpose of visiting the proposed localities, and reporting to the next Council on their capabilities for the purposes of the country meeting.

Cattle Awards.—On the motion of Mr. Fisher Hobbs, the following resolution was adopted:—"That, in accordance with the resolution passed at the last Council, requiring the judges to give in a reserved number for each class of Live Stock, the judges be instructed to give in such number at the Carlisle Meeting, but only in those cases in which the animal would in their opinion possess sufficient merit for the prize awarded in each class, should the animal to which the prize was awarded become subsequently disqualified."

The Council then adjourned to their weekly meeting at 12 o'clock, on Wednesday, the 25th of April, when Prof. Way would deliver before the members of the Society a lecture on the Influence of the Atmosphere on Vegetation.

Reviews.

The Journal of Agriculture, and the Transactions of the Highland and Agricultural Society of Scotland. March, 1855. Blackwood & Son, Edinburgh and London.

This periodical consists, as our readers know, of two separate publications, paged differently, and though stitched together, intended to be bound in separate volumes. The Edinburgh Quarterly Journal of Agriculture has now for some years been in this way issued along with the Transactions of the Highland Society. Both parts of the work in this issue of it contain useful papers. The Journal commences with an article on Auxiliaries to Farm Dung, in which the merits of the several artificial manures, some of which have been exposed and others recommended in our columns, are discussed, and the real value of the so-called Economic Manure is ascertained. Another important paper is by Dr. Voelcker, of Cirencester, on the relative values of Linseed-cake and of Rape-cake; in this he calls attention to the points already referred to by Mr. Lawrence in this paper, and refers to the researches by which the experience of Mr. Lawrence has been so satisfactorily and carefully explained. We extract the following passage on the subject of the poisonous essential oil of Mustard.

"It is a matter of some practical interest to know the conditions under which the essential oil is developed in Mustard seed. Digested in cold or tepid water, Mustard seed or cake furnishes essential oil, provided it has not been heated in the oil-presses as high as 212° F. Digested in boiling water, or heated by itself to a temperature of 212°, it does not generate this oil. The substances contained in Mustard seed, which give rise to the formation of the volatile or essential oil, are called myron and myronic acid. The latter is peculiar to Mustard, but has no smell; the former (myron) resembles in its chemical characters albumen. In a moist state it readily is transformed into a ferment, which, acting upon the myronic acid, gives rise to the production of the essential oil of Mustard. Heated to 212° F., myron becomes coagulated, and in this state is incapable of effecting this change.

"It is for this reason that the Mustard we eat with our beef loses all strength, or rather has not its pungency developed, if it is made with perfectly boiling water.

"An analogous case we find in Horseradish, which does not contain the substance, which is the cause of its pungency ready formed.

"Bitter Almonds likewise do not contain any essential oil, nor prussic acid, ready formed, but two substances which, acting upon each other when bitter Almonds are digested with water, give rise to the formation of the essential oil of Almonds and of prussic acid. One of the two substances contained in Almonds is a beautifully crystallised compound, which is called by chemists amygdalin; the other resembles in its nature albumen, and is called emulsin. At a temperature of 212° F. emulsin loses all power to change amygdalin into the products just named, and hence boiling water prevents the development of the agreeable smell of bitter Almonds, whilst cold readily calls it into existence.

"Laurel leaves, the leaves of *Prunus padus*, Cherry stones, and the kernel of all drupaceous fruits, do not contain any prussic acid, but readily produce this poisonous acid if they are digested with cold water. Thrown into boiling water, the formation of prussic acid is entirely prevented.

"As Linseed-cake is so high in price at the present time, many persons have now recourse to the cheaper Rape-cake, which, I have pointed out, often contains Mustard seed. It appears to me hazardous to give Rape-cake to beasts, without submitting it to an examination. And as boiling water prevents the formation of the pungent oil of Mustard, it may, perhaps, be advisable to mix all Rape-cake with water at 212°. The recommendation of this practice was suggested to me by the following note of Mr. Lawrence, of Cirencester:—

"'Dear Sir,—We have accidentally discovered, in handling Rape-cake for feeding bullocks, that by putting it into water at 212°, for the purpose of making soup to mix with the chaff, an odour of a strong acrid nature, which renders it unpalatable, is destroyed; whereas when it was put in cold water, or merely heated to a certain extent, it sent forth a strong disagreeable odour, and we had great difficulty in getting the cattle to eat the mixture, except from hunger. Perhaps, from your knowledge of the analysis of Rape-cake, you can explain the *modus operandi*. It is a valuable discovery to those who do not like the present non-paying cost of Linseed-cake.—Yours very truly,

'Charles Lawrence.'

"I am not aware that Rape seed contains substances analagous to those which in Mustard give rise to the formation of volatile oil, and am inclined to think that the pungent smell which Mr. Lawrence observed on mixing his cake with cold water was due to the presence of Mustard in the cake; but whether this is the case or not, Mr. Lawrence's experience will be followed, I have no doubt, with much advantage by others. In conclusion, I would suggest the following easy plan of testing Rape-cake. Powder some of the cake, add cold water sufficient to make it into a thin paste, and preserve this paste until the next day. If Mustard seed is present in the cake, the unmistakeable smell and pungent taste of Mustard will have become developed during this time; whereas good Rape-cake, under these circumstances, will not produce a very strong smell, nor taste pungently."

The Transactions of the Highland Society contain papers on Manures, Fences, and Foods for Cattle, and on the last point we extract the following paper by Dr. Anderson:—

"*On Arachis or Earth-nut Cake.*—Some time since I had occasion to direct the attention of the agriculturist to the use of Cotton-seed cake, which, though received at first with some degree of doubt, has now been used with success by several farmers, and its employment is only limited by the deficiency of the supply. I have on several different occasions referred to the great importance of searching for new substances adapted for the food of cattle, and pointed out that the subject was one which ought to engage the attention of both the farmer and the merchant. It is with some satisfaction, therefore, that I point out another variety of cake, the value of which is likely to bring it very rapidly into use. The cake in question is manufactured in France from the seed of the Arachis Hypogæa or earth-nut. This plant, which is entirely different from the earth-nut of this country, has recently been grown pretty extensively in Algeria, from whence it has been imported into France for the manufacture of oil. It has also, as I am given to understand, been introduced into Spain and into the Cape of Good Hope. The first sample of this cake analysed was sent to this country by Messrs. Maxwell & Co., of Bordeaux. Its composition is—

Water	11.56
Oil	12.75
Albuminous compounds	26.71
Ash	3.29
Fibre, and other matters	45.69
	100.00
Nitrogen...	4.27
The ash contains— Phosphates	1.17
The ash contains— Phosphoric acid	0.08

"Compared with ordinary Linseed-cake we find but little difference between the two. In some cases no doubt the quantity of nitrogen in Linseed-cake reaches 4.8 per cent; but in this case the oil is generally less. In fact, cake produced from the same seed varies in composition according to the extent to which the expression of the oil has been carried; and that this modifies the composition of the earth-nut cake is obvious from the subjoined analysis of a sample imported into Leith:—

Water	10.00
Oil	6.78
Albuminous compounds	33.85
Ash	3.73
Fibre, and other matters	45.56
	100.00
Nitrogen	5.39
In ash— Phosphates	1.14
In ash— Phosphoric acid	0.53

"In this sample the quantity of albuminous compounds is very high. Messrs. Maxwell & Co. have communicated the following information regarding the price of this cake last autumn:—

Its price free on board at Bordeaux, per ton, is,	£4 12s. 6d.
Export duty	1 0 0
Freight per steamer to Liverpool, and insurance	1 5 0
Price in Liverpool ...	£7 1 0

If carried by sailing ship the price will be £6 12s. 6d.

"In addition to this there is the cost of landing, &c. at Liverpool; so that this cake could not be sold at a

profit for less than from 7*l.* 5*s.* to 7*l.* 15*s.* per ton; perhaps somewhat more. Of this price, it is worthy of observation that 1*l.* is the duty charged in France on all oilcake exported from that country, and but for that it might be sold at 6*l.* 5*s.* or 6*l.* 15*s.* per ton. This sum might be saved by importing the nut itself into this country; and as it is probable that freight to a British port would not exceed that to a French one, and the cost of expression would be quite as low, the substance deserves the attention of British oil-pressers. The farmer will at once recognise the importance to him of a cake which has so high a value as this, and which has none of the drawbacks of Rape-cake, the Earth-nut being perfectly palatable, and entirely devoid of purgative properties."

Miscellaneous.

Green Crops in the District of the Lockesley Farmers' Club:—

AVERAGE WEIGHT FOR CROP 1854.

Mangold Wurzel Leaves.—This experiment was instituted for the purpose of testing an opinion promulgated by some, viz., that by cutting off the tops of Mangold Wurzel in the latter part of summer, and planting a row of Cabbages in each alley or interval, the produce of the Mangold roots would be very little diminished, whilst, without trenching on the succeeding corn crop, a good crop of Cabbages would be obtained. The results of this trial were as follow, viz.:—

		Roots per statute acre. tons cwt. qrs. lbs.	Tops per statute acre. tons cwt. qrs. lbs.
Mixed Crop	Mangold Wurzel	11 15 2 24	4 15 0 26
	Cabbage	Worthless.	
General Crop of Mangold ...		19 15 0 24	4 18 0 10

The foregoing returns show very clearly that mixed culture of this kind is rather chimerical and cannot be recommended. *Mr. Donaghy's Report of Glasnevin to Dr. Kirkpatrick.*

Calendar of Operations.

APRIL.

INVERNESS.—We have heard a traveller in times gone by describe the want of forethought of the Irish peasantry as such that they might be seen at Christmas digging their Potatoes with a pickaxe. *That* was an instrument in general use in this quarter for collecting the cattle's food. Turnips contain about 90 per cent. of water; the odd 10 per cent. of nutritive matter was, therefore, set before them sealed up in a solid ball of ice. Cattle throve, therefore, ill: sheep not much better while the Turnips lasted: now, on the fields, the yellow Turnips are soft as pulp, the Swedes dry as corks. Experience is proverbially a good teacher; we venture, then, to prognosticate that Turnip heaps will be more generally seen in November next than has hitherto been customary. The Wheat plant looks very scorched like, but has not as yet thinned out much, and already a change of colour is beginning to show itself. Potatoes have kept well in the pits, where sufficient precautions were taken to keep out the frost, but they were from the beginning so few in number, that they formed but a supply for the upper and middle classes of the population, with a few cargoes for export, and a residue of small tubers for seed (not a good plan to use those exclusively), the working classes could not afford to use them, which was felt as a privation. We pass on to the staple of the county—sheep. For them the past three months have been of a very trying nature. Fortunately they were in fine condition when the severe weather set in, which has helped to carry them through better than could otherwise have been the case. The stock in the wintering grounds of the upland districts have not been worse off than the hogs on the frozen Turnip fields of the lower country. Deaths have not been excessive in number, but all kinds are sadly out of condition, and they have still a period of hard fare to pass through, for Turnips are exhausted or destroyed by frost, while in the hills snow still covers the herbage, and the heather has been of late years so much subjected to summer burning, that it does not afford the sweet and valuable pickings which it might do were it less interfered with. Wedders, with a good flush of Spring Grass may get into condition before the summer markets, but ewes will be much out of condition at the lambing time. Lowness of condition, besides telling on the future of the stocks, has, it is well known, a detrimental effect on both the quantity and quality of the clip of wool. *Received from the Reporter to the North British Agriculturist.*

Notices to Correspondents.

DOTCH AND COMB: *G P.* The common stable currycomb and brush will do for the byres as well, and may be used once a day with comfort to the animals.

CULTIVATOR, GRUBBER, AND SCARIFIER: *Francis.* The last is more superficial in its operation than the second. The first is a complete tiller of the ground.

FOR BOILING: *A Sub.* The green tops are not likely to poison the cows; but they are certainly not likely to do any good, and may be injurious.

LINSEED FOR CALVES: *Cambrensis.* A half pint of the jelly made by two pints of Linseed in one gallon of water is about half a good allowance. Cattle will take to oilcake perhaps more readily if the hay or hay chaff which they eat be dusted over with some of the oilcake dust, which might be wetted and made somewhat salt.

SUB-IRRIGATION: *R W.* Mr. Telfer informs us that the pipes used are 3 inches diameter, and their present price 1*s.* 10*d.* to 2*s.* per yard. The length of hose is 80 to 100 yards; the size of tanks depending entirely on the supply of water at command.

SCYTHES.

BOYD'S PATENT SELF-ADJUSTING SCYTHES may be had of the Manufacturers, WILLIAM DRAY & Co., Swan Lane, London; and of all Ironmongers and Seedsmen. A liberal allowance to the trade.

TREE TRANSPLANTING BY M'GLASHEN'S PATENT.

MR. M'GLASHEN is now prepared to supply Apparatus or give Estimates as to the rate at which he will safely and expeditiously transplant Trees or Shrubs of any dimensions in any part of the United Kingdom.
Canonmills Bridge, Edinburgh.

JOHN WARNER AND SONS, 8, Jewin Crescent, London, Manufacturers of FIRE ENGINES, PUMPS, GARDEN ENGINES, and SYRINGES.

Brass Syringes, 9s. to 18s.

All articles of JOHN WARNER & SONS' manufacture may be obtained of any Ironmonger or Plumber in town or country, at the advertised prices.

JOHN WARNER & SONS having been practical Horticulturists for many years, know exactly the requirements of both Amateurs and Gardeners. A gardener with a properly constructed pump will get through as much work in five minutes as he could with any Syringe in a quarter of an hour, and with half the labour to himself. Syringes are economical for small houses.

No establishment offers such a variety of effective machines for hydraulic purposes, whether to supply Gardens, Hothouses, Cottages, Farms, Mansions, or Boards of Health, with every requisite connected with the conveyance and distribution of liquids.
Fountains suitable for Conservatories, Lawns, &c.
Sheets of Engravings sent on application.

JOHN WARNER AND SONS,
Crescent, Jewin Street, London.
GALVANISED IRON TUB GARDEN ENGINE,
WITH WARNER'S REGISTERED SPREADER,

is strongly recommended, for durability and low price, viz., 2*l.* 19*s.*, to hold 10 gallons.

Larger sizes in wood or iron. May be obtained of any Ironmonger or Plumber in town or country, or of the Patentees and Manufacturers, as also Machinery of all kinds for raising Water from any depth to any height by Steam, Horse, or Manual Power. Prices sent on application. Syringes of various constructions and sizes from 9*s.* upwards. Metallic String from 5*d.* to 1*s.* 3*d.* per lb.

WARNER'S IMPROVED LIQUID MANURE, OR GENERAL PORTABLE PUMP.

The valve is a ball of imperishable material, and cannot clog in action. The barrel is of galvanised iron, not likely to corrode, and can be raised or lowered at pleasure. The legs will fold together, and the whole may be carried on shoulder to any pond or tank required.

Price of 4½ in. Pump, with legs, 8*l.* 3*s.* The barrel is 27½ in. long, and the legs are 5 ft. high.

1½ inch Gutta Percha Suction Pipe, 1*s.* 6*d.* per foot.

1½ inch Flexible Rubber and Canvas Suction Pipe, 3*s.* 6*d.* per foot.

May be obtained of any Ironmonger Plumber in town or country, at the above prices, or of the Patentees and Manufacturers, JOHN WARNER & SONS, 8, Crescent, Jewin Street, London.

Every description of Machinery for Raising Water, by means of Wheels, Rams, Deep Well Pumps, &c.; also Fire and Garden Engines, &c.—Engravings sent on application.

WARNER'S PATENT VIBRATING STANDARD PUMPS.

PATENT CAST-IRON PUMPS, for the use of Farms, Cottages, Manure Tanks, and Wells of a depth not exceeding 30 feet.

Diameter of Barrel	Length of Barrel, under nose.		£	s.	d.
2¼ in. short	1 ft. 7 in.	Fitted for lead, gutta percha, or cast iron flanged pipe, as required.	1	12	0
2½ „ long	3 „ 8 „		1	15	0
3 „ ditto	3 „ 6 „		2	12	0
3½ „ ditto	3 „ 6 „		2	18	0
4 „ ditto	3 „ 6 „		3	5	0
2½ „ short, with 15 feet of Lead Pipe attached, and Bolts and Nuts ready for fixing			2	12	0
2½ in. long	ditto	ditto ditto	2	15	0

The short barrel Pump is very convenient for fixing in situations of limited height and space, for the supply of coppers and sinks in Wash-houses with soft water from underground tanks, or in Hot, Forcing, and Plant Houses; they may be fixed, when desired, under the stage.

May be obtained of any Ironmonger or Plumber in Town or Country, at the above prices, or of the Patentees and Manufacturers, JOHN WARNER AND SONS, 8, Crescent, Jewin Street, London.

Every description of Machinery for Raising Water, by means of Wheels, Rams, Deep Well Pumps, &c.; also Fire and Garden Engines, &c. &c.—Engravings sent on application.

TO HORTICULTURISTS, GARDENERS, FLORISTS, ETC.

METALLIC WIRE suitable for Training and Fastening Fruit Trees, Shrubs, Flowering Plants, &c., of all sizes (wire guage) is manufactured at our Lead Works in this city at reduced prices.—Samples and prices will be forwarded on application to DAVIDSON and ARMSTRONG, City Lead Works, Manchester.

TANNED NETTING, for the protection of Fruit Trees from frost, blight, and birds, and for the security of fresh sown seeds, either in Gardens or Fields, at 1*d.* per square yard; 200 yards, 14*s.*; 500 yards, 30*s.*; 1000 yards, 50*s.* Scrim Canvas, for Wall Fruit.—At EDGINGTON and Co.'s, Rick Cloth, Tent, and Waterproof Cloth Manufacturers, 17, Smithfield Bars, City, and Old Kent Road, Southwark; Emigrant Outfitters, Ship Chandlers, and Export Merchants, Brunswick Street, near the East India Export Dock, Blackwall.

FRUIT TREES, POULTRY, RABBIT, SHEEP, AND LAMB FENCING.—Worsted Netting, to protect the Bloom of Peach, Nectarine, and other Trees, Flower or Seed Beds, from frost, blight and birds, 2 yards wide, 5*d.* per yard. New Twine Netting (tanned if required): 1 yard wide, 2*d* per yard; 2 yards wide, 4*d.* per yard; 4 yards wide, 8*d*; half inch Mesh do., 2 yards wide, 8*d.* per yard. Tanned Netting, 2 or 3 yards wide, 1½*d.* per yard; 4 or 6 yards wide, 3*d.* per yard. Elastic Hexagon Garden Net, or Scrim Canvas, 4½*d.* per square yard. Cocoa-nut Fibre, or Hemp Sheepfolding Net, of superior quality, 4 feet high, 4*d.* to 6*d.* per yard. Rabbit Net, 4 feet wide, 2*d.*, 6 feet wide, 3*d*, 8 feet, 4*d.* per yard. Each edge corded, ½*d.* per yard extra, suitable for Poultry Fencing. Square Mesh Cricketing Net, fix its full width and length, made of stout cord, 3*d* to 4*d.* per square yard; this is the best article for Fencing against Fowls, Cats, &c.—W. CULLINGFORD'S, 1, Edmund Terrace, Ball's Pond, Kingsland, London.

A 20-yard Drag Net, with purse complete, 2*l.* 10*s*; a Single Walled Drag Net, any length and depth, 1*s.* per square yard; Casting Nets, complete, 1*s.* per yard, measured round the lead line; Flue Nets, any size, 1*s.* per square yard complete. Minnow Nets, Eel Nets, and Landing Nets equally cheap, all warranted first rate quality and workmanship.

GALVANISED WIRE NETTING FOR GAME AND SHEEP FENCING, AVIARIES, PHEASANTRIES, &c.

2 inch Mesh, light, 6*d.* per lineal yard, 2 feet wide.
" " strong, 8*d.* " " "
Netting of any size or quantity, and Fencing of all kinds, supplied on the shortest notice.—WILLIAM DRAY & Co., Manufacturers, Swan Lane, Upper Thames Street, near London Bridge.

IMPROVED MOWING AND ROLLING MACHINE.

ALEXANDER SHANKS AND SON, Arbroath, Forfarshire, Inventors and Sole Manufacturers, respectfully solicit the attention of the Nobility, Gentry, and Gardeners to this Improved Machine for Mowing and Rolling Lawns. The Machine is in operation in the Royal Gardens at Windsor Palace, Buckingham Palace, and at Osborne, in the Botanical Gardens at Kew, Regent's Park, Manchester, Sheffield, &c.; at Blenheim Palace, Trentham, Cleveden, Elvaston, Broadlands, Woburn Abbey, Clumber, Lilleshall, Castle Howard, Shrubland, Eridge Castle, Enville Hall, Tiptree Hall, Chatsworth, and in many other of the principal gardens in the kingdom as well as in the United States, British America, and on the Continent, where its merits have been fully proved, and its success established.

The machine is made to cut the breadth of 42, 30, 26, and 15 inches respectively, is exceedingly durable, easily managed, and adjusted to cut to the length required. The execution of the work is far superior to what may be attained by the most skilful mower, while at the same time a great saving of labour is effected, and the turf much improved. By the largest machine a Scotch acre may be mowed, rolled, and the Grass collected in one hour.

A. S. and SON have much pleasure in stating that they have made considerable improvements in their 15-inch or hand machine this year, by which the draught is considerably lessened. This machine combines all the merits and advantages of the larger machines with firm and secure construction, and is admirably adapted for borders and for lawns of no great extent.

ALEXANDER SHANKS and SON also respectfully solicit notice to "Fleming's Weeding or Salting Machine" for destroying weeds in gravel walks, court-yards, drives, &c. This machine is now in operation in many parts of England, where it has given ample satisfaction as the best and most economical means of thoroughly keeping down weeds or Moss

Further particulars with testimonials and prices, may be had on application.

CLAYTON, SHUTTLEWORTH, AND CO.'S PRIZE PORTABLE STEAM ENGINES, AND COMBINED THRESHING, STRAW SHAKING, RIDDLING AND WINNOWING MACHINE may be seen at their London Establishment, 6, Fitzroy Terrace, New Road, where all information relative thereto can be obtained. These Machines are constructed to horn Barley, and make a perfect separation of the chaff from the pulse. They are fitted with Elevators, which deposit the grain into bags, and beyond the feeder of Machine require no hands except to take away the Corn, &c., as threshed, the whole of the operations being performed by self-acting machinery, whereby the Corn, Straw, Chaff, and Pulse are delivered in the places assigned for them.

C. S. & Co. have paid special attention to this class of Machinery, and Fixed Barn Machinery, and from the position they have taken at the Royal and all the leading Agricultural Shows of England, flatter themselves that for efficiency, durability, and simplicity, their Engines and Machines are not surpassed by any other maker in England. All letters forwarded to the Works at Lincoln will have immediate attention; and Illustrated Catalogues forwarded to all parts of the kingdom postage free.

STEPHENSON AND PEILL, 61, Gracechurch Street, London, and 17, New Park Street, Southwark, Manufacturers of Copper Cylindrical and Improved Conical Iron BOILERS, and Conservatory and Hothouse Builders, either in Wood or Iron, respectfully call the attention of the Nobility, Gentry, and Nurserymen to their simple but efficacious method of warming Horticultural and other Buildings by Hot Water.

From the extensive works they have executed, references of the highest respectability can be given, and full particular furnished on application.

SAMUELSON'S REGISTERED LAWN MOWING MACHINES. To cut 16, 19, 22, and 25 inches wide. The Registered Improvement renders unnecessary the great care requisite in the handling of these Machines on the old plan. All that is now required can be done *by any unskilled labourer*, who has only to push the Machine before him, the Registered Adjustment insuring a clean cut of uniform height, and preventing the knives from cutting into the soil, however uneven the ground may be. Illustrated Price Lists, with copies of Testimonials, and a Catalogue of his other Agricultural Implements, may be procured, post-paid, on application to the Manufacturer,

B. Samuelson, Britannia Works, Banbury, Oxon.

The above may also be procured at the principal Agricultural Implement Depôts in London, and of all respectable Ironmongers and Seedsmen in the country.

IMPROVED LAWN MOWING MACHINES,

Manufactured and sold by **Budding's Patent.**

J. and H. FERRABEE, Phœnix Iron Works, near Stroud, Gloucestershire.

These are the only MOWING MACHINES that can be used by unskilled labourers with equal facility on Lawns, Verges, between Flower beds on Bowling Greens, Cricket and Pleasure Grounds; 4500 of them have been sold.

A large assortment of every description of Garden Syringes, Pail Engines, Conservatory Pumps, &c., kept in Stock.

Full size Syringe, on Read's principle, of the very best quality and workmanship, with two roses and one jet, 21s.; Plain Syringes from 10s. 6d. upwards.

J. Tylor & Son's Horticultural Apparatus may be obtained at these prices from any respectable Ironmonger or Seedsman in town or country, through whom alone they will be supplied, and of whom Drawings and Prices may be had.

N.B. Cost of carriage, &c., not included in these prices.

J. Tylor & Son's Manufactory, Warwick Lane, Newgate Street, London.

J. TYLOR and SON'S REGISTERED GARDEN SYRINGE.—Small size, for Amateur use, **21s.** each. Large size, for Gardeners' use, **25s.** each.

By a simple arrangement this Syringe is rendered more effective than any portable Conservatory or Garden Pump ever offered to the public. It is equally adapted for Garden or Conservatory use, and is capable of discharging twice as much water in a given time as any other Syringe now in use. The arrangement consists in attaching a small flexible suction tube to the barrel of the Syringe, through which it is filled with water at every discharge of the previous contents. By this means the Syringe is always charged, and the pull up stroke of the piston rendered perfectly easy, it having, indeed, no work to do, the barrel being previously full of water. Being thus made self-supplying, a great saving of labour is effected; and the necessity of stooping to fill the syringe at every discharge being done away with, the direction of the water can be maintained for any length of time. It is perfectly cleanly in its action, as it is not possible for any water to get on the outside of the barrel, which is a well-known inconvenience attendant on the use of every other Syringe. Its construction is perfectly simple, and cannot get out of order; the ground in ball valves and fittings used for all other patent Syringes being entirely superseded. To be had of any respectable Ironmonger or Seedsman in town or country.

J. Tylor & Sons, Manufacturers of Horticultural Apparatus, Warwick Lane, Newgate Street, London.

N.B. These prices do not include carriage, package, or expense of delivery in the country.

JAMES PHILLIPS AND CO., Horticultural Glass Warehouse, 116, Bishopsgate Street Without, London.

Extract from *Gardeners' Chronicle*, April 21, 1854.

"The garden also supplied some Neapolitan Cabbage Lettuces, a portion of which had been grown under bell-glasses which differ from the French cloche in having a ventilator at the top in the shape of a neck or chimney, which can be left open or kept close as may be desired, by covering it over or not with another small bell glass, made for the purpose. **The result of this trial** has been very satisfactory."

GARDEN VASES, FOUNTAINS, ETC.

THOMAS SOMMERVILLE, LANDSCAPE GARDENER, NURSERYMAN, SEEDSMAN, and FLORIST, Garden Road, St. John's Wood, London, begs respectfully to inform the nobility, gentry, and his patrons generally, that he has entered into arrangements with an eminent company in Scotland for the sole disposal in London of their highly ornamental and very durable Vases, Fountains, &c., samples of which may be seen at his grounds in the Garden Road, as above.

T. S. has much pleasure in being the first to introduce to the notice of the public a highly ornamental Vase, capable of resisting the most severe weather, and at little more than half the cost of any other possessing the same qualities; and he has no hesitation in stating that a more suitable Vase for the growth of plants cannot be manufactured.

NOTICE.—TO GENTLEMEN WISHING TO DECORATE THEIR GARDENS, TERRACES, OR GROUNDS.—A large and splendid Collection of FOUNTAINS, FIGURES, VASES, &c., selling at nearly half the usual price, at 74, Borough Road, near Blackman Street, Southwark. Packages forwarded to any part of the United Kingdom or Ireland.

SLATE WORKS, ISLEWORTH, MIDDLESEX.

EDWARD BECK MANUFACTURES in SLATE a variety of articles for Horticultural purposes, all of which may be seen in use at Worton Cottage, on application to the Gardener, Sundays excepted.

Price Lists of Plant Tubs and Boxes forwarded on application.

TRELOAR'S COCOA-NUT FIBRE MANUFACTURES, consisting of MATTING, MATS, MATTRESSES, BRUSHES, NETTING, HORSE-HAIR, and BRISTLE SUBSTITUTE, are distinguished for superiority and excellency of workmanship, combined with moderate prices. Prize Medal both of England and America at the Exhibition of all Nations.

T. TRELOAR, Cocoa-nut Fibre Manufacturer, 42, Ludgate Hill, London.

"FRIGI DOMO."—Patronised by her Majesty the Queen, the Duke of Northumberland for Syon House, His Grace the Duke of Devonshire for Chiswick Gardens, Professor Lindley, at the Horticultural Society, Sir Joseph Paxton for the Crystal Palace, Royal Zoological Society, Mrs. Lawrence, of Ealing Park, and — Collier, Esq., of Hartford.

PROTECTION FROM MORNING FROST.

"FRIGI DOMO," a Canvas made of patent prepared Hair and Wool, a perfect non-conductor of Heat and Cold, keeping, whenever it is applied, a true temperature. It is adapted for all horticultural and floricultural purposes, for preserving Fruits and Flowers from the scorching rays of the sun, from wind, from attacks of insects and from morning frosts. To be had in any required length, 2 yards wide, at 1*s.* 6*d.* per yard run, of ELISHA TRUMAN, sole and sole manufacturer, 7, Trinity Lane, London Street, City, and the Royal Mills, Wandsworth, Surrey; and of all Nurserymen and Seedsmen throughout the kingdom.

It is more durable than mats as a covering."

HORTICULTURE IN ALL ITS BRANCHES.

JOHN WEEKS & Co., King's Road, Chelsea,

HOTHOUSE BUILDERS.

THE NOBILITY AND GENTRY about to erect Horticultural Buildings, or fix Hot-water Apparatus, will find at our Horticultural Establishment and Hothouse Works, King's Road, Chelsea, an extensive variety of Hothouses, Greenhouses, Conservatories, Pits, &c., erected, and in full operation, combining all modern improvements, so that a lady or gentleman can select the description of House best adapted for every required purpose.

The HOT-WATER APPARATUS, which passes through all the Houses and Pits, affording both top and bottom heat, is in constant operation and particularly worthy of attention.

Many of the Houses and Pits are of wide and lofty dimensions and together equal in length 1000 feet. They are all effectually heated by *one boiler*, which, during the severe winter months does not cost in labour and fuel more than 3*s.* 8*d.* per day, and the apparatus is so arranged that each House or Pit may be heated separately and to the required temperature. The splendid collections of Stove and Greenhouse Plants are also in the highest state of cultivation, and for sale at very low prices. Also a fine collection of strong Grape Vines in pots, from eyes, all the best sorts.

Plans, Models, and Estimates of Horticultural Buildings, also Catalogues of Plants, Vines, Seeds, &c., forwarded on application to JOHN WEEKS & Co., King's Road, Chelsea, London.

DEANE'S WARRANTED GARDEN TOOLS.—Horticulturists and all interested in Gardening pursuits are invited to examine DEANE, DRAY, AND CO.'S extensive Stock of GARDENING and PRUNING IMPLEMENTS, best London-made Garden Engines and Syringes, Colebrook Dale Garden Seats and Chairs.

DEANE, DRAY, AND CO. are sole Agents for LINGHAM'S PERMANENT LABELS, samples of which, with their Illustrated List of Horticultural Tools, can be sent, post paid, to any part of the United Kingdom. Also, Wholesale and Retail Agents for SAYNOR'S celebrated PRUNING KNIVES, used exclusively by the first Gardeners in the United Kingdom.

DEANE, DRAY, & CO. (Opening to the Monument), London Bridge.

A RECEIPT FOR THE MILLION.

TO SET CAMELLIAS, with or without artificial heat, by a most simple means. Price 1*s.* 6*d.* by stamps.—Direct, post paid, to R. KEALE, Practical Gardener, 46, Wellington Street, Woolwich.

FARM WITH RESIDENCE.

WANTED TO RENT, upon an improving lease, an ARABLE FARM of not less than 500 acres, with house and garden suited to a gentleman's residence. The situation must be easily accessible from London, and near a first-class railway station south of the Thames will be preferred. The occupation will be very beneficial to the property: most satisfactory references both as to means and agricultural skill will be readily afforded.—Address, with full particulars, to Messrs. DAVIS & VIGERS, 3, Frederick's Place, Old Jewry, London.

CONNEMARA, IRELAND.

TO BE LET, for a term of years and entered upon the 1st of May next, the FARM OF SHANBOOLARD, in the parish of Ballinakill and county of Galway. It consists of about 264 statute acres of Arable, Pasture, and Bog Land, on which a considerable sum has already been spent in permanent improvements. The Farm would be let at a Corn Rent, and, if required, on a long Lease—the rent in proportion. The Farm is bounded on the north by Ballinakill Harbour, affording good sea-bathing; and on the south by Ballinakill Lough, noted for its Brown Trout, and commands extensive views of the Achill and Connemara Mountains. It is within eight English miles of the market-town of Clifden.—For particulars apply to Mr. EDWARD WHITWELL, Letterfrack, Galway.

HIGHLANDS OF PERTHSHIRE.

TO BE LET, CASTLE MENZIES and SHOOTINGS; the House, as furnished, affording ample accommodation for a numerous family and establishment, along with 10,000 acres of Muir and Low Ground Shootings. The stock of Game, which has been strictly protected and well preserved, will be found good, healthy, and of all the usual descriptions; and Salmon Fishing is to be had along the banks of the Tay and Lyon, which bound the property for six miles. The post passes the gate, and from Aberfeldy (two miles distant) coaches proceed in all directions. Supplies are easily procured. The climate is exceedingly good; and the place would be equally suitable as a permanent residence or as a shooting quarter.—Apply to ARCHIBALD CAMPBELL, Camserney Cottage, by Aberfeldy.

HOUSE AND SHOOTING—ISLAND OF MULL.

TO BE LET, CARSAIG HOUSE, beautifully situated on the South Coast of Mull. It contains three public rooms, seven bed-rooms, three dressing-closets, and a bath, ample accommodation for servants, and is well supplied with water. The tenant may have accommodation for two or three horses, and may have a pasture for two cows, or be supplied with dairy produce. There is a good Vegetable Garden. The Shooting extends over about 5000 acres, which have been very little shot over for many years. Other 4000 or 5000 acres adjacent may be obtained. The Game consists of grouse, black game, partridge, hare, and rabbits, and occasionally red deer. The Sea Fishing is excellent, and there are two small Trouting Streams on the Estate. There is a commodious Quay and Landing-place, and Steam-boats pass the house in the summer three times a-week.

TO SPORTSMEN, STOCK FARMERS, ETC.

TO BE SOLD, a range of nearly 6000 acres of easily-travelled GROUSING GROUND, not surpassed in the Lowlands of Scotland for its sporting qualifications, and watered by several small Trouting Streams, having also a comfortable Small Lodge, all situated in the midst of several strictly preserved estates, in one of the most southerly counties, and of easy access from England or elsewhere, from being within five miles of a seaport, as well as forming a very improving and easily-managed investment as a Stock Farm for a moderate capital. The proprietor is ready to treat for a Sale of the same.—Apply, free, to No. 639, N.B.A.O., Edinburgh.

TO BE SOLD CHEAP, by private sale, a GARDEN CHAIR, with back, and scroll elbows, 5 feet 6 inches long, 16 inches seat; a portable foot rest.—Apply to J. P., 2, Churton Place, Pimlico.

TO BE SOLD, BUFF COCHIN CHICKENS, from first class Prize Birds, Brahma Pootra Chickens, from imported American Prize Birds, and Spanish Chickens. Also some very good one-year-old Birds of the above descriptions. Wire, Game, and Poultry Netting, Poultry Hurdles, Hen-houses, Chicken Coops, Flower Stands, and Trainers, Garden Arches, and every kind of Wire Work, useful and ornamental.—T. M. FOX'S, City of London Wire Works, 44, Skinner Street, and 6 & 8, Snow Hill.

Illustrated Catalogues forwarded post free.

DORKING BLUE MOTTLED FOWLS' EGGS, 12*s.* per dozen. Took first Prize at Brighton Exhibition of three counties, 1854.—Address Mr. ED. HENDER, Beehive Inn, Dorking, Surrey.

EGGS FOR SETTING may be had from the Yard of Mr. H. D. Davies, whose stock has been carefully bred and selected from all the best strains, and has already taken upwards of 250 prizes.

Spanish, Dorking, Brahma, and Rangoon Eggs, 2*l.* 2*s.*, and White Cochin and Aylesbury Ducks, 1*l.* 11*s.* 6*d.*, the dozen, to include basket, &c.

Spanish and Dorking Fowls of all ages may be selected from that portion of the stock not required for breeding or exhibition this season.

For Cock and 1 Pullet	... ...	...	£5 5 0
For Cock and 2 Pullets	... ...	...	7 7 0
For Cock and 4 Pullets	... ...	...	10 10 0

Remittances, by Post-office Order, payable to GEORGE KEEBLE, the Bailiff, Spring Grove House, Hounslow, to accompany all orders.

Mr. Davies will feel obliged if persons who wish to see the Poultry will make it convenient to do so between the hours of 10 and 4 on any Wednesday or Saturday.

Sales by Auction.

ORCHIDS FROM INDIA.

MR. J. C. STEVENS will Sell by Auction, at his Great Room, 38, King Street, Covent Garden, on TUESDAY, 24th April, at 12 o'clock, an importation of 11 cases of ORCHIDS just received per Overland Route; they have arrived in the best possible state, and contain the finest parcel of Saccolabium retusum that has ever reached this country; also large masses of Dendrobium Devonianum, formosum, Cambridgeanum, clavatum, transparens, Falconerianum, and a new yellow species—Coelogyne Walliciana, a new Cymbidium, Vanda Jenkinsoniana, &c. &c.—May be viewed on the morning of sale, and Catalogues had of Mr. J. C. STEVENS, 38, King Street, Covent Garden.

TO GENTLEMEN, FLORISTS, AND OTHER.

MESSRS. PROTHEROE AND MORRIS will Sell by Auction, at the Mart, Bartholomew Lane, on FRIDAY, April 27th, at 12 o'clock, a first-class collection of CARNATIONS, PICOTEES, and PINKS, a fine assortment of AMERICAN PLANTS, choice HOLLYHOCKS from a celebrated grower, DAHLIAS in dry roots, PÆONIES, VERBENAS, FUCHSIAS, CAMELLIAS, AZALEA INDICA, GERANIUMS, &c.—On view the morning of Sale. Catalogues had at the Mart, and of the Auctioneers, American Nursery, Leytonstone, Essex.

MR. J. WILLMER will sell by Auction, at the Mart, Bartholomew Lane, on THURSDAY, April 26, at 12 o'clock, a choice collection of CARNATIONS, PICOTEES, PINKS, AURICULAS, ROSES, YELLOW PICOTEES, &c.—On view the morning of sale, and Catalogues at the Mart, and of the Auctioneer, Sunbury, Middlesex.

TO MARKET GARDENERS, FLORISTS, AND OTHERS.

MR. J. WILLMER is instructed by Mr. Thorp to Sell by Auction, on the premises, near the Railway Station, Feltham, on TUESDAY, April 24th, at 3 o'clock, 120 PIT LIGHTS and two GREENHOUSES, the whole quite new. On view till the time of sale, and Catalogues had on the premises, and of the Auctioneer, Sunbury, Middlesex.

IMPORTANT SALE OF HURDLES, GATES, CONSERVATORIES, HAND-GLASSES, IRON BUILDINGS, ETC.

TO BE SOLD BY AUCTION, on MONDAY, the 30th of April, on the premises of Boydell and Glasier, Camden Works, Hawley Crescent, near the Canal Bridge, Camden Town, London, about 200 Patent Twisted IRON HURDLES, 14 CONSERVATORIES, 200 Patent HAND-GLASSES, 30 IRON HOUSES, suitable for labourers' Cottages, out-buildings, &c. Arrangements will be made to erect the Conservatories and Houses within a given distance of London.—May be seen, and Catalogues had on the premises, one week prior to the sale.

SEEDS CARRIAGE FREE.

AGRICULTURAL SEEDS.—*Landed Proprietors and Farmers who require* LARGE QUANTITIES *of Turnip, Mangold Wurzel, Carrot, or any other kinds of Agricultural Seeds, will be supplied on the most liberal terms.*—Apply to

WILLIAM E. RENDLE & Co., Seed Merchants, Plymouth.

PRICES FOR THE MONTH OF APRIL.—*The prices quoted in* MESSRS. SUTTON'S *Advertisement of last week, page 237, will not be considered binding for articles ordered after the expiration of the present month.*

ITALIAN RYE-GRASS.—INSTRUCTIONS ON THE CULTIVATION of this useful plant are sent with all parcels of "Sutton's Improved Italian Rye-grass," and "Dickenson's Italian Rye-grass" Seed, supplied by Messrs. SUTTON, who will also be happy to forward a copy of the same to any of their friends on receipt of one penny stamp for postage.—Address,

SUTTON & SONS, Seed Growers, Reading, Berks.

SKIRVING'S IMPROVED TURNIP SEEDS.

W. SKIRVING, Queen Square, Liverpool, begs to acquaint his friends and the public that he has fixed the price of his TURNIP SEEDS for the season, as follows:—

SKIRVING'S IMPROVED SWEDE TURNIP, at 1*s.* 9*d.* per lb.

IMPROVED PURPLE-TOP YELLOW BULLOCK TURNIP, at 1*s.* 3*d.* per lb.

All other kinds of Turnip and Agricultural seeds in general, of the most select description, at moderate prices. A remittance, or reference from unknown correspondents, is respectfully requested to accompany orders. W. S. has no agent in town or country.

Liverpool, April, 1855.

SEED POTATOES.

ALSTONE KIDNEY.—*This is perfectly distinct from any other Potato. It is an astonishing cropper, and the tubers are of a large size. It keeps well, and is good flavoured, and is altogether an excellent and profitable variety. 2s. 6d. per peck, or 9s. per bushel.*

PRINCE OF WALES.—*This is an early round white Potato, which, for a general crop, can be highly recommended. It is a sort that gives the most complete satisfaction to every one who sows it. 2s. 6d. per peck, or 9s. per bushel.*

J. C. WHEELER & SON, Gloucester, Seedsmen to the Gloucestershire Agricultural Society.

ESTABLISHED IN THE EARLY PART OF THE 18TH CENTURY.

RHODODENDRON CAMPANULATUM (TRUE).

WILLIAM JACKSON AND CO., Bedale, Yorkshire, having a large stock of this most distinct and beautiful species, will supply fine bushy plants, perfect Shrubs on their own roots, 9 inches high, 40*s.* per 100, or 1*s.* 6*d.* each; 12 to 15 inches high, 60*s.* per 100, or 2*s.* 6*d.* each, during the present planting season: afterwards no more will be offered at the prices. Not a leaf is injured by the late severe winter.

BEDDING AND OTHER PLANTS.

F. AND A. SMITH'S Descriptive LIST of the undermentioned is now ready, and may be had, post free, on application:—Antirrhinums, Verbenas, Fuchsias, Scarlet Geraniums, Calceolarias, Petunias, Heliotropes, Pentstemons, Chrysanthemums, Mimulus, Salvias, Lobelias, &c. Climbers in variety, also a miscellaneous Collection of Greenhouse Plants. They have now in bloom Cytisus racemosus, Roses, Verbenas, Fuchsias, spotted Calceolarias, Erica Hybrida, Cactus, Geraniums, &c. The Trade supplied.—Dulwich, Surrey. April 21.

J. COLE begs to inform the admirers of Calceolarias that he is now prepared to supply a few more orders from his Choice Stock of Unblooomed SEEDLINGS; the seed was saved from the choicest spotted and striped varieties, carefully impregnated, at 3*s.* and 4*s.* per dozen, 20*s.* and 25*s.* per 100. Also strong plants of his Fine Bedding Calceolaria Prince of Orange, for habit and profusion of bloom unequalled. Strong Plants without pots, 6*s.* per dozen; well established, 9*s.* per dozen

The Trade liberally supplied. A Remittance solicited from unknown correspondents. Post-office Orders payable at St. Alban's.

Keyfield Nursery.

EUONYMUS; OR, THE "BURNING BUSH" OF NORTH AMERICA.—The advertiser has just returned from America, and brought with him a few Seeds of the above new and beautiful hardy ornamental small tree. It grows from 6 to 10 feet high, and of an uniform bushy, compact habit, quite unlike any of the varieties known in English gardens. For four months in the autumn it is densely studded with its beautiful scarlet seeds, which makes it an object of the most striking and admirable character, and hence the name "BURNING BUSH" has been given to it by the natives. The advertiser's knowledge of plants and their worth enables him to say that hundreds of trees have been sent out as being hardy and ornamental, whose claims to notice were far, very far inferior to those of the "BURNING BUSH." 50 perfect seeds will be forwarded post free, on the receipt of 50 postage stamps, addressed to A. B., 12, Great Pulteney Street, Golden Square.

N.B. Specimens of this charming plant will be shown at the next Monthly Meeting of the Horticultural Society, 21, Regent Street, London.

FARM SEEDS.

W. DRUMMOND AND SONS have implicit confidence in recommending the following Seeds:—

PERENNIAL RYE-GRASS, from the most select growths, and perfectly clean.

ITALIAN RYE-GRASS, direct from Lombardy, and through the same gentleman in that country who has for several years been employed by us in collecting those fine parcels which have hitherto given so much satisfaction to our customers.

GRASSES FOR PERMANENT PASTURE.—*Having been among the first to recommend the use of the* NATURAL GRASSES *in the formation of* PERMANENT PASTURE, *the subject has occupied a large share of our attention. We have carefully noted the species composing the best Natural Pastures, and the results of combinations in culture under varied circumstances of soil and situation; and, as the result of our observations, as well as from the great satisfaction our selections have given, we feel warranted in recommending, in addition to the Grasses usually sown, a variety of such species as are known, not only to yield the greatest bulk of herbage, but the largest amount of milking and feeding properties, varying those species, and the proportions of each, according to the nature of the land to be laid down.* From the increased demand, we are enabled to charge a lower price than formerly. An excellent assortment, and allowing a *liberal supply* of Seeds, may be had at from 24*s.* to 26*s.* per statute acre.

TURNIP, in all the leading varieties, saved by ourselves from full-formed Bulbs.

VETCHES (or TARES), large broad-leaved, a very superior sort.

Priced Lists of the above, with every other description of Farm Seeds, may be had post free on application.

FREE DELIVERY.—All Parcels of Seeds above 2*l.* value (with the exception of Grain and Vetches), delivered free in London, Liverpool, Hull, Newcastle, Belfast, Londonderry, Aberdeen, Inverness, and to all the Stations along the Lines of the Caledonian and North British Railways, &c.

W. DRUMMOND & SONS, Seed and Implement Warehouse, Stirling, N.B.

Paradise Nursery, Hornsey Road, Holloway, London.

GREAT NOVELTIES FOR THE ENSUING SEASON.

FUCHSIAS WITH WHITE COROLLAS.

LUCOMBE, PINCE, AND Co. beg leave to announce that they shall be prepared to send out two splendid and entirely novel Seedling Fuchsias, early in May next, viz.:—

FLORENCE NIGHTINGALE.

Pure white corolla, with brilliant scarlet sepals, finely reflexed; an extremely lovely and novel variety.

GALANTHIFLORA-PLENA.

(The DOUBLE Snowdrop Corolla'd Fuchsia.)

Pure double white corolla, resembling a fine large double Snowdrop, with rich scarlet sepals; altogether distinct from anything of the kind ever yet produced. Price 10*s.* 6*d.* each.

Together with a very beautiful new double Purple variety,

VIOLÆFLORA-PLENA,

Rich double blue corolla, resembling a fine double violet, 7*s.* 6*d.* each.

L., P., & Co. have also fine plants of the following choice kinds of Fuchsias at 18*s.* to 42*s.* per dozen.:—

Aspasia	Glory	Purple Perfection
Apollo	Lucretia	Sir Harry Smith
Brilliant	Orion	Sidonia
Duchess of Lancaster	Prime Minister	Sir Jno. Falstaff
Duke of Wellington	Princess	Telegraph
Dominiana	Kossuth	Resplendent.

They are also now prepared to send out their beautiful new

VERONICA KERMESINA,

Raised by that eminent horticulturist J. Luscombe, Esq., of Coombe Royal, who sent specimens to Dr. Lindley, at the time of its first flowering, who thus pronounces his first opinion of it:—"The variety sent with this was charming, a decided rose colour having mingled with the violet." See also notice of Dr. Lindley in the *Chronicle* for Dec. 2, 1854, as follows:—"L., P., & Co. Your V. Kermesina is a handsome dark variety of V. speciosa; its beautiful large spikes of deep purplish crimson blossoms cannot fail to make it a favourite." Price 7*s.* 6*d.* each. A few extra-sized specimens may be had.

The usual discount to the Trade when three or more are taken.

Exeter Nursery, Exeter.—ESTABLISHED IN 1720.

NEW AZALEA—"ALBA MELIOR."

THIS is the one exhibited by us under the name of "ALBA MAGNA" among our collection to which the First Prize was awarded at the Regent's Park Show; very large pure white, and quite first-rate. Price 7*s.* 6*d.*, 10*s.* 6*d.* & 21*s.* Also a superior stock of Azaleas, for which see Catalogue.

The Spring Catalogue, consisting of Greenhouse and Stove Plants, and the Herbaceous one can be had by enclosing a postage stamp.

H. LANE & SON, The Nurseries, Great Berkhamsted.

CHOICE GERANIUMS.

WILLIAM HUSSEY begs to offer the undernamed collection for 30*s.*, fine healthy plants, package included, viz.:—Alonzo, Ariadne, Belle of the Village, Beauty, Colonel of the Buffs, Conspicuum, Christine, Constance, Cora, Chloe, Diana, Elise, Enchantress, Eurydice, Ganymede, Generalissimo, Gulielma, Lavinia, Lord Mayor, Little Nell, Magnificent, Magnet, Major Domo, May Queen, Mechanna, Nonpareil, Nectar Cup, Narcissus, Ocellatum, Optimum, Old Story, Prince of Orange, Prince Arthur, Pearl, Pulchra, Rosa, Rubens, Roweana, Rosamond, Rachael, Silk Mercer, Virgin Queen.

A remittance or reference to accompany all orders from unknown correspondents.—Horticultural Gardens, Norwich.

PHLOX BEAUTY OF MILRIG.

DREGHORN AND AITKIN, NURSERY and SEEDSMEN, Kilmarnock, N.B., beg to acquaint the Public that they have still a small stock of the above PHLOX, which is considered by all good judges who have seen it in flower to be the best white Phlox in cultivation, both as to size and form of flower. Price 2*s.* 6*d.* each, with one added to every three ordered by the Trade.

D. & A. beg to acknowledge thankfully the large share of patronage they have received for this flower.

Kilmarnock, April 21.

CHEAP NEW FUCHSIAS AND VERBENAS.

JOHN HOADE, Addlestone, near Chertsey, offers the following:—Autocrat, Clio, Charles Palmer, Cyrus, Hero, Duchess of Lancaster, Duke of Wellington, Lucretia, Glory, King Charming, Macbeth, Nil Desperandum, Orion, Omega, Perfection (Standish's), Queen of Hanover, Vesuvius. Post free 8*s.* the dozen; single plants, 1*s.*

VERBENAS.—Avalanche, Fair Rosamond, Iver Rival, Incomparable, King of Scarlets, Hon. Mrs. Gerard Leigh, Prince of Wales, Prince of Orange, Queen of Purples, Rouge et Noir, Sarah, Standard. Post free at 5*s.* per dozen; older sorts, 3*s.* per dozen.

SPRING FLOWERS.—CINERARIAS, good flowering Seedling Plants, 4*s.* to 6*s.* per doz.; fine named varieties, 6*s.* to 9*s.*

HYACINTHS in pots, various colours, just showing flower, 4*s.* per doz.; also a few very fine named flowers, many of which are catalogued at 1*s.* to 1*s.* 6*d.* each, in the same state as the above, 9*s.* per doz.

FINE HERBACEOUS CALCEOLARIAS, from Mason's seed, in large and small 60 pots, 4*s.* to 6*s.* per doz.

WOOD and INGRAM, Nurseries, Huntingdon.

ORCHIDS.

WILLIAM MAULE AND SONS have received their annual importations of ORCHIDS from their collectors in the East, which they beg to offer on the following terms, many of which are one and two years established:—Vanda teres, 1*s.* 6*d.*; Vanda cærulea, 21*s.*, 42*s.*, 63*s.*, 105*s.*; Vanda teres, 1*s.* 6*d.*; Aerides odoratum, 10*s.* 6*d.*; Aerides affine, 42*s.*; Foxbrush, 10*s.* 6*d.*; Dendrobium Devonianum, 10*s.* 6*d.*; Cambridgeanum, 10*s.* 6*d.*; Gibsoni, 10*s.* 6*d.*; densiflorum, 10*s.* 6*d.*; Farmeri, 10*s.* 6*d.*; Pierardi, chrysanthum major, 7*s.* 6*d.*; nobile, mixed with Wallichianum, 7*s.* 6*d.*; Pierardi, mixed with latifolia, 7*s.* 6*d.*; clavatum, 15*s.*; moschatum, 10*s.* 6*d.*; Camarotus purpurea, 10*s.* 6*d.*; Cœlogyne cristata, or Pleome, Wallichi and maculata, in pots, with four or five plants or bulbs, 10*s.* 6*d.* each; Saccolabium ampullaceum (very scarce), small plants, 63*s.* each.—The Nurseries, Bristol.

MR. J. LINDEN, of Brussels, has much pleasure in announcing that his CATALOGUE of NEW and RARE EXOTIC PLANTS is now ready, and may be had on application to his Agents, Messrs. BETHAM and BLACKITH, Cox and Raymond's Quays, Lower Thames Street, London, and at the Office of this Paper.

WHEELER AND SON'S SHORT SELECT SEED LIST.—Our Priced List of Seeds for this season, containing Descriptions and Prices of the best GARDEN and FLOWER SEEDS, will be forwarded free by post. It is our earnest endeavour to send out all Seeds, whether for the Garden or Farm, of the very best quality and true to name; and as many of them are our own growing, and are proved before sending out, we generally succeed in giving entire satisfaction to our customers.

We are in daily receipt of most gratifying letters and repeated orders from those we had the honour of serving last year. In as we deliver our Seeds CARRIAGE FREE, we very respectfully solicit the honour of an order from those who have not yet given us a trial.—J. C. WHEELER & SON, Gloucester, Seedsmen to the Gloucestershire Agricultural Society.

QUEEN'S GRAPERIES AND NURSERY GROUND.

PARK STREET, AND AT 176, WESTERN ROAD, BRIXTON.

ESPARY, NURSERYMAN, FLORIST, and SEEDSMAN, begs respectfully to return thanks to his numerous patrons and friends for the increasing patronage received, and would direct attention to his extensive collection of Plants, Vines, Seeds, &c., &c., at the above establishments. His new Catalogue of select Dahlias, Plants, &c., for 1855 is now ready and can be had on application.

LANDSCAPE GARDENING, GARDEN ARCHITECTURE AND GENERAL IMPROVEMENT OF DOMAINS, WOODS, PLANTATIONS, ETC.

CHARLES M'INTOSH, F.R.P.S., A.L.S., &c. Author of the "Book of the Garden," and other works on Horticulture, &c., late Curator of the Gardens of his Majesty the King of the Belgians at Claremont and Brussels, and latterly to those of his Grace the Duke of Buccleuch at Dalkeith Palace, begs to inform the nobility, and the proprietors of estates generally, that, in consequence of the numerous applications he has been honoured with for Plans and superintendence of all kinds of Garden Erections, Laying-out Grounds, the Management of Woods and Plantations, and other matters connected with Rural Economy, he has made arrangements which will enable him to dedicate his whole time and attention to these objects.

The practical experience of upwards of 40 years, both in Great Britain and on the Continent, and in a field of operation he believes more extensive and varied than has fallen to the lot of most individuals in his profession, will, he hopes, be sufficient guarantee to those who may honour him with their commands that they will be executed efficiently.

C. M. would particularly direct the attention of the public to his new and important improvements in Hothouse and Conservatory Building, which he flatters himself will in all cases secure economy, elegance, and fitness for the purpose, and of which examples can be referred to.

Address, Lugton, Dalkeith, N.B. After 1st of May, address Newcome Villa, Murryfield, Edinburgh.

Printed by WILLIAM BRADBURY, of No. 13, Upper Woburn Place in the Parish of St. Pancras, and FREDERICK MULLETT EVANS, of No. 37, Lower Street, in the Parish of St. Margaret and St. John, Westminster, in the County of Middlesex, Printers, at their Office in Lombard Street, in the Precinct of Whitefriars, in the City of London; and published at the Office, No. 5, Charles Street, in the Parish of St. Paul, Covent Garden, in the said County, where all Advertisements and Communications are to be ADDRESSED TO THE EDITOR.—SATURDAY, April 21, 1855.

HORTICULTURAL SOCIETY OF LONDON.—The FIRST SUMMER MEETING will take place at the Society's House, 21, Regent Street, on TUESDAY, May 8, from 12 to 5 P.M.

HORTICULTURAL SOCIETY OF LONDON.—GARDEN EXHIBITIONS.

The last day on which Privileged Tickets can be obtained at 21, Regent Street, upon the orders of Fellows, at 3*s*. 6*d*. each, is [illegible] Inst.

The FIRST EXHIBITION of the Season will take place, by permission of her Majesty's Commissioners for the Great Exhibition of 1851, in the GROUNDS of GORE HOUSE, on WEDNESDAY, May 16.

ROYAL BOTANIC SOCIETY, REGENT'S PARK.—The EXHIBITIONS of PLANTS, FLOWERS, and FRUIT this season will take place on WEDNESDAYS, May 9, June 13, and July 4, and of AMERICAN PLANTS, MONDAY, June 18.

Tickets of admission may be obtained at the Gardens only, by gift from Fellows or Members of the Society—price on or before May 5th, 4*s*.; after that day 5*s*. each.

CRYSTAL PALACE.—HORTICULTURAL FETE.—It is intended to hold a grand Horticultural Exhibition at the Palace on SATURDAY, the 2d of June next. The Rules and Schedules of Prizes are now ready, and can be obtained on application to the Secretary.

April 28. (By Order.) G. GROVE, Secretary.

ROYAL SOUTH LONDON FLORICULTURAL SOCIETY.—In the Advertisement of this Society, in the last Number of this Journal, for THURSDAY, May 2d, read WEDNESDAY, May the 2d.

CHICHESTER HORTICULTURAL SOCIETY.—The Summer Exhibition will take place on THURSDAY, June 21st, in the Gardens of the Episcopal Palace. Schedules may be had by application to the Secretary,

H. SILVERLOCK, Jun.

COUNTY OF GLOUCESTER AND CHELTENHAM ROYAL HORTICULTURAL SOCIETY.—The First Exhibition of the season will take place on WEDNESDAY, May 2d, at the Royal Old Wells, Cheltenham.

HENRY J. COCHRANE, Secretary.

11, Colonnade, Cheltenham.

GREAT NATIONAL EXHIBITION OF FLORAL AND HORTICULTURAL PRODUCE.

THE CUMBERLAND FLORAL AND HORTICULTURAL SOCIETY OF CARLISLE will hold a GREAT EXHIBITION of FLOWERS, FRUITS, VEGETABLES, &c., in spacious marquees and tents (engaged for the purpose), on the 24th, 25th, and 26th of July (open to the United Kingdom), adjoining to, and during the week of the Royal Agricultural Society's Exhibition, when 200*l*. will be awarded in Prizes.

Schedules of Prizes and every information may be obtained by applying to the Secretary, either personally or by letter. By order of the Council, JOHN PATTERSON, Secretary.

42, English Street, Carlisle.

WILLIAM MASTERS AND SON, LANDSCAPE GARDENERS, Exotic Nursery, Canterbury.

WILLIAM BARRATT, LANDSCAPE GARDENER, Wakefield.

*** Plans and Estimates furnished.

ROGERS'S AGRICULTURAL CULINARY AND FLOWER SEED DEPOT, GARDENERS' REGISTRY OFFICE, &c., &c., Clock House, Chelsea.—All the new Flower Seeds and everything rare and good supplied at reasonable prices.

BEDDING PLANTS.

JOHN HAYES, FLORIST, Farnham, Surrey, begs to offer the above from 1*s*. to 4*s*., per doz., the latter end of May, when the weather will permit. Catalogues sent on the receipt of the postage stamp.

BEDDING PLANTS.

WOOD AND INGRAM are prepared to send out the following, in fair proportions of each, strong and WELL established Plants of the best standard varieties, at 3*s*. per dozen, package included:—

Verbenas	Senecio	Cineraria amelloides
Pelargoniums	Nierembergia	Scarlet Geraniums
Ageratums	Chrysanthemum porto luteo	Salvias, &c. &c.

W. & I.'s Spring Catalogue is now ready, and may be had on application.—Nurseries, Huntingdon.

SPECIAL CONTRACTS.

SUTTON AND SONS are prepared to make Contracts on very liberal terms to Farmers or others requiring Seeds in considerable quantities.

THE PERENNIAL WHITE CLOVER.—This Clover is included in all Messrs. Sutton's mixtures for Permanent Pasture, and is very superior to the common White Clover; it may be purchased separately, price 1*s*. 6*d*. per pound.

Address—SUTTON & SONS, Seed Growers, Reading.

ALSIKE CLOVER TRIFOLIUM HYBRIDUM.

SUTTON AND SONS have some pure genuine Seed of this superior new CLOVER, which will be found an invaluable Perennial Plant.

MANGOLD WURZEL SEED.

PURCHASERS OF LARGE QUANTITIES will be treated liberally.—For prices apply (stating the quantity required) to SUTTON & SONS, Seed Growers, Reading.

SUTTON'S LARGE YELLOW GLOBE MANGOLD WURZEL, FROM SELECTED ROOTS, QUITE HARDY.—Seed of this fine large Mangold Wurzel may be obtained genuine of Messrs. SUTTON, price 1*s*. per lb., or 5*l*. per cwt.; other sorts cheaper. Early orders are requested and recommended, as the stock is limited.—Address,

JOHN SUTTON & SONS, Seed Growers, Reading, Berks.

SPECIAL CONTRACTS FOR SEEDS.—*Noblemen, Clergymen, or Yeomen requiring large quantities, special contracts will be made, at a great reduction in price, on application to*

WILLIAM E. RENDLE & Co., Seed Merchants, Plymouth.

CLOVER SEEDS.

GENUINE NEW CLOVER SEEDS *can be had at the lowest market prices of* JOHN SUTTON & SONS, SEED GROWERS, READING, BERKS.

MORTON'S YELLOW GLOBE MANGOLD.—*From Seed grown from the original stock of J. C. Morton, Esq., the Editor of the* AGRICULTURAL GAZETTE. 1*s*. 6*d*. *per lb.*

WILLIAM E. RENDLE & Co., SEED MERCHANTS, Plymouth.

WHITE BELGIAN CARROT, 2*s*. *per lb., or much cheaper by the cwt.*

WILLIAM E. RENDLE & Co., SEED MERCHANTS, Plymouth.

TRUE GUERNSEY PARSNIP.—*This is a large and superior sort, and can be strongly recommended. The Subscribers have just imported a choice lot of Seed from Guernsey, and can supply it at 2s. per lb.*

WILLIAM E. RENDLE & Co., SEED MERCHANTS, Plymouth.

BOSSOM'S CHAMPION OF ENGLAND CELERY.

THE finest Celery yet introduced, beautifully white, very crisp and solid, and withstands a greater amount of frost than any other known variety; it has been blanched in the ground 3 feet.—To be obtained of T. F. WINSTANLEY, Seedsman, 28, Market Place, Manchester, price 2*s*. 6*d*. per packet; prices to the trade on application.

MAY'S MAGNUM BONUM LETTUCE is by far the largest, sweetest, and crispest Lettuce known, in proof of which we possess numerous letters received from parties who had it last season. The addresses of the writers can be had on application. Only a few packets remaining at 1*s*. each.—HENRY MAY, the Hope Nurseries, near Bedale, Yorkshire.

DWARF FRENCH BEANS can be had in any quantity.—Apply to J. G. WAITE, Seed Merchant, 181, High Holborn, London.

ORANGE TREES.—A large number of different sizes—amongst them are perhaps the finest young specimens ever offered for sale in this country. The larger sizes are particularly well shaped, with fine stems, and in perfect health, and are well adapted for producing immediate effect in conservatories.

Height of stem, 1½ feet; diameter of head, 1½ feet.
" " 2 " " " 1½ "
" " 3 " " " 2 "
" " 4 " " " 2½ "

Prices vary from 7*s*. 6*d*. to 105*s*. each.

HUGH LOW & Co., Clapton Nursery, London.

500,000 FLAT-POLE OR DRUM-HEAD CABBAGE PLANTS.

THOMAS MOORE, NURSERY AND SEEDSMAN, Fore Street, Kingsbridge, Devon, begs to call attention to his large Stock of CABBAGE PLANTS, which will be ready in May and June. They are a superior late sort, and raised from seed of his own saving.

SEED POTATOES.

WOOD AND INGRAM, NURSERIES, Huntingdon, having a few more than they want for their own planting, offer the following varieties at the prices annexed for cash.

	Per bushel.		Per bushel.
Mitchell's Albion ...	5*s*. 0*d*.	Lapstone Kidney ...	5*s*. 0*d*.
Forty Fold	5 0	Chapman's ditto ...	5 0
Allen's Early Kidney, extra early	6 0	Martin's Globe ...	5 0
Jackson's Improved do.	6 0	British Queen, extra ...	6 0

THE FLUKE KIDNEY POTATO.—This excellent variety is now planted here as the principal crop, being more free from disease and more prolific than any other in cultivation. It was raised in Middleton, and may be had genuine in any quantity at 5*s*. per bushel of 56 lbs.—Apply to JOHN HOLLAND, Bradshaw Gardens, Middleton, near Manchester.

Post-office Orders to be made payable at Middleton, Lancashire.

THE LANCASHIRE FLUKE POTATO.—Fine medium-sized SEED of this celebrated variety, warranted true, to be disposed of, at 5*s*. per bushel of 60 lbs., bags included. A reduction will be made when a quantity is ordered.

Post-office orders to be made payable to ROBERT DAVENPORT, Gardener and Seedsman, Union Street, Bury, Lancashire.

SEEDS FOR THE FARM, CARRIAGE FREE.—SEE RENDLE'S "FARMING PRICE CURRENT AND AGRICULTURAL DIRECTORY."

WILLIAM E. RENDLE & Co., Seed Merchants, Plymouth.

GRASS SEEDS.

J. C. WHEELER AND SON'S DESCRIPTIVE PRICED LIST OF GRASSES FOR PERMANENT PASTURE will be forwarded free by post on application.

J. C. WHEELER & SON, Gloucester, Seedsmen to the Gloucestershire Agricultural Society.

A GENERAL CATALOGUE OF PLANTS, TREES, AND SHRUBS offered for sale by HUGH LOW & Co., Clapton Nursery, London, is now ready to be sent free by post to any person applying for the same.

PELARGONIUMS, ETC.

HENRY GROOM, Clapham Rise, near London, by Appointment FLORIST TO HER MAJESTY, begs to say that his Spring CATALOGUE OF PELARGONIUMS, &c., is ready, and will be forwarded on application.

T. F. WINSTANLEY'S BEDDING PLANT LIST is now ready, and can be had on application, or free by post.—28, Market Place, Manchester.

NEW AND RARE PLANTS.

MESSRS. VEITCH AND SON respectfully announce that their DESCRIPTIVE LIST OF NOVELTIES for this season is now ready for distribution, and will be forwarded on application.—Nurseries, Exeter and Chelsea, April 28.

PINUS BENTHAMIANA—(TRUE).

MESSRS. VEITCH AND SON having succeeded in raising from Seed a number of this beautiful Pine, which is, doubtless, the finest of the long-leaved Californian kinds, and has proved to be perfectly hardy, are now enabled to offer good established plants on the following terms:—A single plant, 10*s*. 6*d*.; six plants, 50*s*.; twelve plants, 84*s*. Prices to the trade in proportion to the quantity taken, given on application.

Exotic Nurseries, Chelsea and Exeter.—April 28.

NEW ROSES.

H. LANE AND SON, The Nurseries, Great Berkhamsted, beg to inform their Patrons and Customers in general that they possess all the NEW ROSES of the Season, but cannot confidently recommend them until they have bloomed in the autumn. The Rose Catalogue may be had on application.

CHEAP DAHLIAS AND VERBENAS.

H. LEGGE is sending out all the leading Sorts of last Season, 9*s*. to 12*s*. per dozen; Older Varieties, 3*s*. to 4*s*. do. Catalogues can be had on application.

Marsh Side, Edmonton.

OSAGE ORANGE (MACLURA AURANTIACA).

CHARLWOOD AND CUMMINS can supply SEED of the above-named Hedge Plant at 6*s*. per lb., with full directions for treatment. The month of May is the best time for sowing.—14, Tavistock Row, Covent Garden, London.

RHODODENDRON CAMPANULATUM (TRUE).

WILLIAM JACKSON AND CO., Bedale, Yorkshire, having a large stock of this most distinct and beautiful species, will supply fine bushy plants, perfect Shrubs on their own roots, 9 inches high, 40*s*. per 100, or 1*s*. 6*d*. each; 12 to 15 inches high, 60*s*. per 100, or 2*s*. 6*d*. each, during the present planting season; afterwards no more will be offered at the prices. Not a leaf is injured by the late severe winter.

CHOICE PANSIES.

HART AND NICKLIN, FLORISTS, &c., Guildford, offer the following, the set for 12*s*.: Beadle'a, Elegantissima, France Cycole, Sir J. Paxton, Constance, National, Criterion, Alfred the Great, Caroline, Sylvia, Sultan, Marchioness of Bath, Eva, Ophir, Mr. Beck, Duke of Perth, British Queen, Euphemia, Adela, Blanche, Royal Purple, Pompey, Lady Carrington, and Lord Jeffrey.—Choice varieties, 4*s*. per dozen.

SUPERB HOLLYHOCKS, SEEDS, ETC.

WILLIAM CHATER begs to offer packets of seed, consisting of 20 varieties, from his best Show Hollyhocks, at 5*s*.; 12 varieties, 2*s*. 6*d*.; and from good double sorts, 1*s*.

Superior Quilled German and French Asters, in 12 varieties, mixed, 1*s*. per packet; separate, 2*s*. Fine Quilled African Marigolds, 6*d*. per packet.—Saffron Walden Nurseries.

BANKS' SEEDLING FUCHSIAS.—1855.

(FOR FULL DESCRIPTION SEE FORMER ADVERTISEMENTS, AND ON APPLICATION).

W. J. EPPS has much pleasure in stating that the above Fuchsias have been proved to be the finest that have been raised by that celebrated grower E. Banks, Esq., Deal. Early orders are solicited. The set of six, 2*l*. 2*s*. The usual discount to the trade.—Bower Nurseries, Maidstone.

NEW SCARLET VERBENA—MRS. WOODROFFE.

ARTHUR HENDERSON AND CO. are now sending out this fine new VERBENA; particulars of which may be seen in their advertisement in the *Gardeners' Chronicle* of March 31. The usual discount to the Trade.

☞ This Verbena is the same as "Conqueror," one offered by another firm.—Pine-apple Place, Edgware Road, London.

LUCOMBE, PINCE AND CO. beg respectfully to announce that they will be prepared to commence sending out their new White Corolla'd Fuchsias Florence Nightingale and Galanthiflora-plena; also their new Double Purple variety Violaeflora-plena, on MONDAY, the 14th May next, when all orders intrusted to their care will receive their best attention.

Exeter Nursery, Exeter.—Established 1729.

BRITISH FERNS.—Good plants of British Ferns including some of the rarer sorts can be supplied, on moderate terms, on application to Mr. SMITH, Post Office, Matlock, Bath.

IPOMŒA RUBRO CŒRULEA.—Seed of this exceedingly beautiful Climbing Annual being now obtainable at a moderate price, all cultivators of flowers having a greenhouse or wall with warm aspect are advised to include it in their spring selection.—Seed supplied to Seedsmen and Nurserymen only, by GEORGE ROBERTS, 32, Moorgate Street, London.

AGRICULTURAL SEEDS, MEADOW & PASTURE GRASSES, &c.

PETER LAWSON AND SON, of Edinburgh and London, the Queen's Seedsmen, Nurserymen, and Wood Foresters; and to the Highland and Agricultural Society of Scotland, beg to intimate to their English Customers and the Public that they are now sending out FARM SEEDS of every description, saved from genuine stocks, and for which they respectfully solicit orders.

Also Garden Seeds, Flower Seeds, Garden Implements, Draining Tools, and everything connected with their trade. Catalogues will be sent on application.

London Branch, 27, Great George Street, Westminster.

P. L. & S. are always able to recommend experienced Bailiffs, Gardeners, and Foresters.

SUTTON'S LAWN GRASS SEEDS,

At the Crystal Palace, Sydenham.

SUTTON AND SONS *have had the honour of supplying to the Crystal Palace Company the Grass Seeds by which so many acres of Arable Land have been converted into the beautiful Park and Lawns, now so much admired at Sydenham.*

The following letter has been received, besides many others:—

From Professor Lindley, Horticultural Society, 21, Regent Street, London.—"We have already made trial of your Lawn Grass Seeds, and it is only justice to say that they have proved the best we have sown for many years."

Price 1*s.* per lb.; 2*s.* 6*d.* per gallon; or 20*s.* per bushel. Quantity required for forming new Garden Lawns, 2½ bushels, or 50 lbs.

Address John Sutton & Sons, Seed Growers, Reading, Berks.

EVERGREEN GRASSES FOR CHURCHYARDS, ETC.

SUTTON AND SONS have had the honour of supplying many clergymen and others with Grass Seeds for Churchyards and Cemeteries, which have given great satisfaction. Price of Seed, 1*s.* per lb., or 18*s.* per bushel.

From many similar letters we present the following:—

From Mr. C. Judd, Gardener to his Grace the Archbishop of Canterbury.

"The Grass Seeds received from you succeeded admirably, and, although sown late, the growth was such that we were enabled to mow the churchyard in the autumn, and it has now the appearance of an established lawn of some years standing; my employer, the Archbishop of Canterbury, is quite satisfied with its appearance.—Addington Park, Jan. 7."

Address, John Sutton & Sons, Seed Growers, Reading, Berks.

IMPROVEMENT OF GRASS LANDS.

SUTTON'S RENOVATING GRASS SEEDS FOR IMPROVING OLD PASTURES.—Many old upland pastures, parks, and meadows are nearly destitute of Clovers, and the finer and more nutritious sorts of Grasses: in which case these seeds should be sown early in the season, when the improvement in the pasture will be very great, and at a small expense.

The following is similar to many other letters received from former purchasers, showing the benefit derived from sowing these seeds.

From Sir David Cunyngham, Bart., Wellesbourne, Warwick.

"*The meadows that were renovated with your seeds are looking very well. I cut nearly two tons of hay to the acre, and three years ago the same land hardly produced half a ton per acre.*"

Quantity of seed required, 8 to 12 lb. per acre. Price, 9*d.* per pound, carriage free.

Address John Sutton & Sons, Seed Growers, Reading, Berks.

THE PAMPAS GRASS "GYNERIUM ARGENTEUM."

LUCOMBE, PINCE, AND CO. have a fine healthy stock of this highly Ornamental Plant, well established in pots, and fit to send out immediately. It is universally admitted that few plants produce a more beautiful effect than this gigantic Grass. See Woodcut and description of it in the *Gardeners' Chronicle* of November 4th, 1854. Sizes, prices, and all particulars may be had on application to Lucombe, Pince, & Co., Exeter Nursery, Exeter.—Established 1720.

GRASS SEEDS FOR PERMANENT PASTURE,

24*s.* to 30*s.* per acre.

IMPORTED ITALIAN RYE-GRASS.
PACEY'S PERENNIAL RYE-GRASS.
LAWN GRASS SEED, 1*s.* per lb.
TRUE PERENNIAL RED CLOVER, or COW GRASS, 10*d.* per lb.—Delivered carriage free.

J. C. Wheeler & Son, Seed Growers, Gloucester, Seedsmen to the Gloucestershire Agricultural Society.

Established in the early part of the 18th century.

MEADOW AND PASTURE GRASS SEEDS.

GEORGE GIBBS AND Co., 26, Down Street, Piccadilly, beg to announce that their Mixtures of Grass Seeds are now ready for delivery at the following prices:—

Mixtures for laying Land down to permanent Grass, for light, heavy, and other soils (allowing 2 bushels and 12 lbs. to the acre) ... ... 30*s.* per acre.
Mixtures for Park or Field Lawns (allowing 2 bushels and 12 lbs. to the acre) ... ... 32*s.* per acre.
Mixtures for improving and renovating old Grass Land, 1*s.* per lb.
Mixtures (finest sorts) for forming Lawns... ... 1*s.* 3*d.* per lb.

These Seeds are all new, and have all been properly cleaned and their growing properties fully tested. Directions for sowing accompany the seed.

G. G. and Co.'s New Priced AGRICULTURAL CATALOGUE is now ready, and will be forwarded free on application.

GEORGE GIBBS & CO., Seedsmen,
26, Down Street, Piccadilly, London.

GRASS AND AGRICULTURAL SEEDS.

THOMAS GIBBS AND CO., the Seedsmen to the Royal Agricultural Society of England, beg to inform their friends and agriculturists generally that they are now prepared to supply the undermentioned in any quantities required.

Mixtures of Grass Seeds for laying down land to permanent Pasture and Meadow; Irrigation or Water Meadow Mixtures; Upland Sheep Walk Mixtures; Park and Field Lawn Mixtures; Renovating Mixtures for old Swards; Garden, Lawn, or Grass-plot Mixtures; various Permanent Grass Seeds supplied separately to order; Mixtures for one year's lay, do. for two or three years' lay (commonly called "seeds").

CLOVERS.—Red or broad leaved, white or Dutch, Red Suckling, Alsike or Hybrid, Trefoil, Cow Grass or Perennial.
RYE-GRASSES.—Italian (very fine), Annual, improved Perennial, and other kinds.
CARROTS.—Large White Belgian, large field Altringham, Yellow Belgian, long Orange or Surrey.
PARSNIPS.—Gibbs' large Guernsey Cattle, common large.
MANGOLD WURZELS.—Long Red, Orange or Yellow Globe, Red Globe, long Yellow.
CABBAGES.—Large Drumhead Cattle, Thousand headed.
TURNIPS.—Purple-top Swedes, Green-top Swedes, Skirving's Swedes, Green-top Yellow Hybrid, Red-top Yellow Hybrid, Globes or Rounds, Tankard's sorts, Kohl Rabi.
Lucerne, Broom, Furze or Gorse, Field Parsley, Rape, Seed Barley sorts, Wheat sorts, Rye, Sainfoin, Tares, White Mustard, White Silesian Beet, Peas, Potatoes, and all other seeds for the farm.

KITCHEN GARDEN AND FLOWER SEEDS, including all the new and most improved varieties. Assortments made up to suit different sized gardens, or to any given amount.

Priced Lists of Agricultural and Garden Seeds sent free by post on application to Thomas Gibbs & Co., Corner of Half-Moon Street, Piccadilly, London.

THE FORWARDEST TURNIP KNOWN.

SUTTON'S EARLY SIX WEEKS' TURNIP should now be sown for feeding off early. Excellent new seed 1*s.* 2*d.* per lb., 6*s.* per gallon, or 42*s.* per bushel. Mr T. Hickman, of Brimpton House, near Newbury, in a letter dated February 1, says:—

"*I must mention the Six Weeks' Turnip as the best sort I have ever seen for earliest and latest sowings. I have grown them several years, and have invariably found them to produce more seed in less time than any other Turnip. I have had them after Wheat of a good size, within six weeks from the time of sowing.*"

N.B. Carriage free, except parcels under 20*s.* value.

Address, J. Sutton & Sons, Seed Growers, Reading, Berks.

NEW EARLY SWEDE.

THE YELLOW TANKARD SWEDISH TURNIP is valuable for early sowing instead of the common White Tankard, the root being equal in quality to the best Yellow Swede, although the leaf is similar to a common Turnip. It is of rapid growth, consequently adapted for the earliest and latest sowings. Price 2*s.* per lb. Carriage Free, except very small parcels. 2 lbs. of seed per acre is sufficient.

Address, SUTTON & SONS, Seed Growers, Reading.

MANGOLD WURZEL AND SWEDE SEED.

JOHN SUTTON AND SONS, Reading, Berks, have a fine stock of the best kinds of SWEDES, MANGOLD WURZEL, and CARROT SEED, similar to those supplied last season, the produce of which gained Prizes at all the principal Root Shows throughout the kingdom.

At the Annual Root Show held at Basingstoke, Hants, in December, at which 16 prizes were awarded for root crops, 13 were gained with the produce of our seeds.

SMITHFIELD CLUB.—CHRISTMAS SHOW.

We had the honour of exhibiting at the above show a stand containing some of the finest Roots in the Bazaar, all grown from our own seeds. The Editor of *Bell's Weekly Messenger* in his report of the show says:—

"At Messrs. Sutton's Stand the principal articles exhibited were Sutton's Lincolnshire Red Globe Turnip, Sutton's Green Topt Hybrid Turnip, Yellow Globe Mangold, and Ashcroft Swedes, all of which were particularly fine."

A Priced List, with Hints on Cultivation, may be had post free, in return for two penny stamps.

RENDLE'S IMPROVED SWEDE TURNIP.—*This is the most hardy variety in cultivation, and has stood the late severe winter, in the most exposed situations, without the least injury. The Subscribers have received scores of letters during the past month to confirm this statement.*

It is handsome in form. Small tap roots, will keep longer than any other sort, and is altogether a most valuable variety.

It has been selected with much care for the last seven years, and the present stock has been saved by growers of the first respectability. Price 2s. per lb., or 1s. 9d. per lb. if taken by the cwt. Wholesale Dealers can be supplied with a few bushels.

For Description, Testimonials, and Engraving, see RENDLE'S "FARMING PRICE CURRENT AND AGRICULTURAL DIRECTORY."—Apply to William E. Rendle & Co., Seed Merchants, Plymouth.

TO THE SEED TRADE.—TURNIP SEEDS, &c.

Skirving's or Liverpool Swede	Orange Globe Wurzel
Laing's	Broccoli, of sorts
White Globe Turnip	Fairbeard's Nonpareil Peas
Green	Cole's Crystal White Celery.
Red Tankard	

W. J. Epps can with confidence offer the above (not large quantities), having been grown from the best selected stocks possible.—Prices sent on application.

Seed Establishment, High Street, Maidstone, April 28.

SKIRVING'S IMPROVED TURNIP SEEDS.

W. SKIRVING, Queen Square, Liverpool, begs to acquaint his friends and the public that he has fixed the price of his TURNIP SEEDS for the season, as follows:—

SKIRVING'S IMPROVED SWEDE TURNIP, at 1*s.* 9*d.* per lb.
" IMPROVED PURPLE-TOP YELLOW BULLOCK TURNIP, at 1*s.* 3*d.* per lb.

All other kinds of Turnip and Agricultural seeds in general, of the most select description, at moderate prices. A remittance, or reference from unknown correspondents, is respectfully requested to accompany orders. W. S. has no agent in town or country.

Liverpool, April, 1855.

SUPERB SHOW PANSIES.

JOHN HOLLAND, Bradshaw Gardens, Middleton, near Manchester, will supply the following set of 20 extra fine varieties, in strong, well rooted, autumn struck Plants, at 10*s.* the set, hamper, package, &c., included.

Argo (Paton & Small)	Lady Carrington (Hunt)
Adela (Turner)	Lord Jeffrey (Lightbody)
Alfred the Great (Turner)	Mesmerist (Veitch)
Boadicea (Fellowes)	Miss Talbot (Dickson & Co.)

Great Western (Hooper)	Thisbe (Hooper)
Lady Emily (Downie & Laird)	Victory (Schofield)

Older varieties, such as Fair Flora, France Cycole, Queen of England, Duke of Perth, Rubens, Caroline, Ophir, Blue Perfection, Euphemia, &c. &c., 4*s.* per dozen, strong plants.

A few packets of very select Pansy Seed at 1*s.* and 2*s.* per packet. Priced and descriptive Catalogues now ready, and will be forwarded on application. Post-office orders payable at Middleton, Lancashire.

BEDDING AND OTHER PLANTS.

F. AND A. SMITH'S Descriptive LIST of the undermentioned is now ready, and may be had, post free, on application:—Antirrhinums, Verbenas, Fuchsias, Scarlet Geraniums, Calceolarias, Petunias, Heliotropes, Pentstemons, Chrysanthemums, Mimulus, Salvias, Lobelias, &c. Climbers in variety, also a miscellaneous Collection of Greenhouse Plants. They have now in bloom Cytisus racemosus, Roses, Verbenas, Fuchsias, spotted Calceolarias, Erica Hybrida, Cactus, Geraniums, &c. The Trade supplied.—Dulwich, Surrey, April 28.

SEED POTATOES.

ALSTONE KIDNEY.—*This is perfectly distinct from any other Potato. It is an astonishing cropper, and the tubers are of a large size. It keeps well, and is good flavoured, and is altogether an excellent and profitable variety. 2s. 6d. per peck, or 9s. per bushel.*

PRINCE OF WALES.—*This is an early round white Potato, which, for a general crop, can be highly recommended. It is a sort that gives the most complete satisfaction to every one who sows it. 2s. 6d. per peck, or 9s. per bushel.*

J. C. Wheeler & Son, Gloucester, Seedsmen to the Gloucestershire Agricultural Society.

Established in the early part of the 18th Century.

SEEDS CARRIAGE FREE.

AGRICULTURAL SEEDS.—*Landed Proprietors and Farmers who require* large quantities of *Turnip, Mangold Wurzel, Carrot, or any other kinds of Agricultural Seeds, will be supplied on the most liberal terms*—Apply to

William E. Rendle & Co., Seed Merchants, Plymouth.

ESTABLISHED ABOUT HALF A CENTURY.

AGRICULTURAL SEEDS OF THE FINEST SELECTED STOCKS.—*As the quantity of Mangold, some of the Turnips, &c., are found to be scarce on the market as was expected at the close of harvest, we submit our present prices, in which some will be found lower than quoted in our Spring Catalogue.*

PERMANENT PASTURE AND OTHER GRASSES.—Our Mixtures for Permanent Pastures will be found equal to any which are supplied. Prices per acre, according to the nature of the soil, 24*s.* to 34*s.* Wholesale Prices of Grasses and other Seeds to the trade on application.

Finest Mixed Lawn Grasses, per lb. 1*s.*, or 4*s.* 6*d.* per peck.

☞ Goods Carriage Free (not under 20*s.*) to all the London termini, or any station on the Colchester and Norwich line.

BASS AND BROWN, Seed Establishment, Sudbury, Suffolk.

AGRICULTURAL SEEDS.

JOHN SHARPE (late of Sleaford), Seed Grower and Merchant, Bardney, embraces the earliest opportunity of tendering thanks for the extended patronage conferred upon him at Sleaford, in the branches of Nursery Seedsman and Merchant; he trusts the same assiduity will meet a continuance of those favours. He intends connecting with the Seed Trade the Growing, thereby dispensing with all doubt as to genuineness of article.

J. S. is now sending out, of the purest and best selected stocks, Permanent Grass Mixtures, 20*s.* per acre; Upland Sheep Walk, 20*s.* per acre; Field or Lawn Mixtures, 9*d.* per lb.; Improving Mixtures for old Swards.

CLOVERS.—Red, English, Dutch, German, French, 6*s.* to 8*s.* per stone; White, 8*s.* to 10*s.* per stone; Italian Rye-grass, fine imported, 6*s.* to 7*s.* per bushel; Perennial Rye-grass, 25*s.* to 30*s.* per quarter; Mangold Wurzel, 8*d.* per lb., or 7*s.* per stone.

TURNIPS.—Skirving's and Purple-top Swedes, transplanted and of the purest characters, 1*s.* 3*d.* per lb., or 60*s.* per bushel; 50 lbs.; White Globe or Round, 8*d.* per lb., or 30*s.* per bushel; 50 lbs.; Green Globe or Barrel, 8*d.* per lb.; White and Red Tankards, Lincolnshire Red Globe or Round, Early Sixweeks, Yellow Aberdeen, Orange Jelly, and other yellow-fleshed kinds.

Rape Seed or Cabbage Cole, 3*s.* 6*d.* per peck, or 12*s.* per bushel.

White Mustard, Spring Tares, &c.

For quantities, Purchasers treated with liberality.

Bardney Hall, near Lincoln, April, 1855.

FARM SEEDS.

W. DRUMMOND AND SONS have implicit confidence in recommending the following Seeds:—

PERENNIAL RYE-GRASS, from the most select growths, and perfectly clean

ITALIAN RYE-GRASS, direct from Lombardy, and through the same gentleman in that country who has for several years been employed by us in collecting those fine parcels which have hitherto given so much satisfaction to our customers.

GRASSES FOR PERMANENT PASTURE.—*Having been among the first to recommend the use of the* Natural Grasses *in the formation of* Permanent Pasture, *the subject has occupied a large share of our attention. We have carefully noted the species composing the best Natural Pastures, and the results of combinations in culture under varied circumstances of soil and situation; and, as the result of our observations, as well as from the satisfaction our selections have given, we feel warranted in recommending, in addition to the Grasses usually sown, a variety of species as are known, not only to yield the greatest bulk of herbage but the largest amount of milking and feeding properties, mixed those species, and the proportions of each, according to the nature of the land to be laid down.* From the increased demand, we are enabled to charge a lower price than formerly. An excellent assortment, and allowing a *liberal supply* of Seeds, may be had at from 24*s.* to 26*s.* per statute acre.

TURNIP, in all the leading varieties, saved by ourselves from full-formed Bulbs.

VETCHES (or TARES), large broad-leaved, a very superior sort.

Priced Lists of the above, with every other description of Farm Seeds, may be had post free on application.

Free Delivery.—All Parcels of Seeds above 2*l.* value (with the exception of Grain and Vetches), delivered free in London, Liverpool, Hull, Newcastle, Belfast, Londonderry, Aberdeen, Inverness, and to all the Stations along the Lines of the Caledonian and North British Railways, &c.

W. Drummond & Sons, Seed and Implement Warehouse, Stirling, N.B.

A. STANSFIELD AND SON beg to offer the following:—

1000 species and varieties of Herbaceous and Alpine Plants, 4*s.* per dozen, or 30*s.* per 100.

500 species and varieties adapted for Rockwork at 4*s.* per dozen.

200 species and varieties of Hardy Greenhouse and Store Ferns and Lycopods, at from 6*s.* per dozen, and upwards.

Verbenas, Fuchsias, Geraniums, and other Bedding Plants at from 3*s.* 6*d.* per dozen. Catalogues on application.

*** 100 bushels of selected Fluke Potatoes at 4*s.* 6*d.* per bushel of 56 lbs. Dean's Seedling Fluke at 3*s.* 6*d.* per stone of 14 lbs.

Vale Gardens, Todmorden, Lancashire.—April 28.

FLOWER SEEDS.—We have selected out of our large collection of Flower Seeds the most beautiful and showy varieties, each sort distinct in colour, and calculated to produce a fine effect when planted out in beds or groups in the flower border. We have had each variety distinctly marked with the Botanical and English name, height, time of flowering, colour of the flower, manner of growing, whether annual or perennial, &c., the time it should be sown, and other valuable hints as to its cultivation. In selecting these varieties we have taken care to exclude all which are shy bloomers or have an inelegant appearance, so that the collections will comprise only those which are really showy and handsome, and which we believe will prove to the entire satisfaction of any lady or gentleman who might be disposed to order them. The German Stocks and Asters especially are most superb. The Collections will be sent free by post to any part of the kingdom at the following prices:—

20 extra fine varieties, all distinct and beautiful	...	5*s.*
50 do. do.	...	10*s.* 6*d.*
100 do. do.	...	20*s.*

J. C. Wheeler & Son, Nurserymen and Seed Growers, Gloucester, Seedsmen to the Gloucestershire Agricultural Society.

Established in the early part of the 18th Century.

MESSRS. WILLIAM ROLLISSON AND SONS embrace this medium of announcing that they will commence sending out the first week in May the annexed three new ERICAS which they can with the greatest confidence recommend, and which will doubtless be as universally admired as the sorts previously introduced by them, among which may be named Cavendishii, semiinstilera, Hartnelli, Ventricosa superba, mutabilis, [illegible], Tricolor elegans, Sprengelii.

ERICA AEMULA.—This is a very beautiful hybrid in the Erica Massoni section, of a fine bright crimson colour, after the style of Erica aristata, but very much higher in colour; altogether this is a very distinct variety. 21s.

ERICA EXIMIA SUPERBA.—This variety may really be said to be three times as fine as the parent whose name it bears; it is a very compact grower and excellent habit, with tubular blossoms of a fiery scarlet colour. This charming variety obtained the First Seedling Prize at the Royal Botanic Gardens, 1852 31s. 6d.

ERICA PAXTONI.—A very distinct variety, obtained by hybridising Erica Hartnelli with Erica Massoni. It blossoms in very large whorls, of a soft red colour. This variety will be very useful for autumnal exhibition purposes, as it blossoms from July to October 21.

The Set of the above named Ericas three guineas.

The following choice and new Plants can be seen in blossom at the Nurseries:—

Brassia cinnamomeum (new).	Cypripedium Lowi (rare).
Cattleya Aclandiæ (rare).	Odontoglossum pescatoris (new).
" iantha (new).	" hastilabium (rare).

With several Orchids equally rare.

The Nurseries, Tooting, London.

GERANIUMS.

BASS AND BROWN have the following to offer, strong and healthy plants, well established for a fine and abundant bloom. For descriptive list see their autumn Catalogue.

The following 12 Superb New Show Varieties of last season for 40s., or separately as priced.

Dobson's Eliza ...	... 3s. 6d.	Turner's Duchess of Wellington ...	... 5s. 0d.

GLOXINIAS.

The following set of 11 new varieties of last season are very fine, and may be had for 33s., or separately 3s. 6d. each:—

Duke of Wellington, rich velvety scarlet of stout substance, throat shaded with violet, and slightly spotted with white.
Eleanor, pure white, blotched with rose, and purple shade.
Elegantissima, French white of great substance, pale lavender centre, spotted with buff.
Erecta Magnifica, fine white, with blue throat, habit of Fyfiana.
Eugenie, rosy pink, centre creamy white, spotted with rose.
Exquisite (Henderson's), pure white, with broad belt of puce, throat creamy white, spotted with puce.
Grand Sultan, a fine Continental variety.
Lady Franklin, extra large rose, stout and robust, shading off to pink, slightly spotted white in the throat.
Magnet, clear rose, with blotch of purple in the throat, large and fine form.
Prince of Wales, white, shading off to lavender.
Sir C. Napier, deep rosy crimson, throat blotched with intense rose, dwarf habit.

The following 12 superb vars. for 20s.:—Belle Clymene, Duchess de Brabant, Dr. Plancheon, Grandis, Hogoveen, Imperialis, Leonie Van Houtte, Petoiana, Princesse de Lamballe, Victoria Regia, Wilsonia, and Wortleyana.

ACHIMENES.

The following three very beautiful new varieties may be had for 17s. 6d.:—

Madame Rendatler, a fine large purplish lilac, with yellowish white throat ... ... 5s. 0d.
Picturata, brilliant rose colour, flowers of the form of multiflora, with darker spots, exceedingly handsome ... 5 0
Gigantea, a novelty beyond comparison, resembling Picta, but twice as large and brighter colours, very free and keeping in flower several months 10 6

Twelve Superb Varieties for 10s., including Louis Van Houtte, Mr. Aparpart, Cerito, &c.; 12 fine older vars. for 6s.

TWO VERY USEFUL NEW DWARF NASTURTIUMS.

JOHN CATTELL has much pleasure in bringing into notice these two very showy hardy ANNUALS, viz.:—

NASTURTIUM DWARF CRIMSON.—The colour of the common dark crimson.

Ditto DWARF SCARLET.—The colour very rich orange scarlet, with a fiery shade on the upper part of the throat.

They are both of the dwarf compact habit of minimus, and admirably adapted for forming large buds, particularly in any poor soils; the flowers are the size of the common Nasturtium, and thrown well above the foliage, and are a mass of bloom throughout the summer and autumn. Packets, containing 12 seeds, 1s. each, post free.

J. C. has also the following choice Seeds for present sowing, at the prices annexed per packet, post free:—

NEW BEDDING PLANTS.

CHARLES TURNER has much pleasure in introducing the following New Plants:—

CALCEOLARIA "PURITY," a new and beautiful shrubby variety, pure paper white, dwarf free habit, and a most desirable bedding plant. Very highly recommended. 7s. 6d. each.

NEW VERBENAS.

*WONDERFUL (Edmonds), rich plum purple, with very large white centre. This is without exception the finest and most distinct variety yet introduced, and is especially recommended for bedding purposes, continuing fully in bloom until very late in the season. It obtained a Certificate of Merit at National Floricultural Society.

*BLUE BEARD (Edmonds), a decided blue, good shape, large truss, and an excellent bedding variety. Highly recommended.

*LADY LACON (Edmonds), bright rose, with large pale yellow centre, good shape and habit. This also is a first-rate bedding variety. Obtained a First-class Certificate at National Floricultural Society for form.

COMMANDER-IN CHIEF (Edmonds), bright cerise, with yellow eye, free bloomer, and good habit. Very fine.

EMPRESS OF FRANCE (Edmonds), large pale rose, fine truss.

FLORENCE NIGHTINGALE (Edmonds), pink, yellow eye, good shape.

ROSE OF ENGLAND (Edmonds), bright rosy pink, with yellow eye, good form, free and distinct, fine.

TYRIAN PRINCE (Edmonds), deep blue purple, fine and distinct. Received a Certificate at Norwich.

EVA (Turner), pure white, fine truss, and free bloomer.

The above 5s. each, or the Set for 2l. The three varieties marked thus * were figured in the "Florist" for April, 1855.

NEW DAHLIAS.

Cossack (Fellowes) ...	10 6		
Agincourt (Fellowes) ...	10 6		

For Descriptions of these varieties see Catalogue, which can be had on application.—Royal Nursery, Slough.

NEW STRAWBERRY—CAROLINA SUPERBA.

JAMES KITLEY begs to inform his friends and the public that he has succeeded in raising from Seed a New Strawberry, the qualities of which have long been a desideratum. It possesses the excellent flavour of the old Carolina, the fruit as large as the British Queen, with all the combined good qualities of productiveness, hardiness of plant, dwarf habit, &c., which tend to make it a general favourite. It was exhibited at the Chiswick Horticultural Exhibition, and obtained a First-class Certificate.—See *Gardeners' Chronicle*, July 15, 1854.

Dr. Lindley's Opinion.

"J. K., the Strawberry which you have named Carolina Superba partakes of the flavour of the old Carolina, but the fruit was bruised by carriage, so that the paper which accompanied the Strawberries was saturated with juice, and this juice dried on the paper like syrup — sweet, adhesive, glossy, and brownish coloured. Strawberry juice does not usually possess these properties."—See *Gardeners' Chronicle*, July 1, 1854.

The undermentioned gentlemen having had opportunities of seeing it growing, and also tasting the fruit, have kindly permitted their Testimonals to be placed before the public:—

"Your Carolina Superba Strawberry, which I saw last summer in bearing, appeared a very hardy and productive kind, with the flavour of the old Carolina, and will prove an acquisition to this class of fruit.

"JOHN SPENCER, Marquis of Lansdowne's, Bowood."

"I feel much pleasure in giving my opinion of your Seedling Strawberry, Carolina Superba. Having had frequent opportunities of seeing it growing and tasting the fruit, I consider it hardy, of good habit, short foliage and fruit-stem. In flavour and crop, I know none that will surpass it: and feel assured it will do you credit, and give satisfaction to all who may purchase it.

"JAMES POND, Devonshire Cottage, Bath."

"The Seedling Strawberry, named Carolina Superba, that I saw in fruit in your nursery last season, appeared to me to be a first-class variety of dwarf foliage, a profuse bearer, and flavour excellent. I have no doubt it will give the greatest satisfaction to all who may possess it.

"D. BUTLER, Widcombe Nursery, Bath."

Strong well-rooted PLANTS are now ready, at 3l. per 100, 10s. per dozen, or 12s. free by Post.

Lyncombe Vale Nursery, Bath.

To Farmers, Potato Growers, and Others.

JACKSON'S PATENT PREPARATION

FOR

PRESERVING POTATOES, WHEAT, AND OTHER SEEDS

FROM DISEASE, the RAVAGES of the SLUG, GRUB, and WIREWORM, in addition to which the CROPS are brought forward in HEALTH AND VIGOUR, and the yield is greatly increased, in proof of which the following extracts are given from numerous letters received by Mr. JACKSON.

EXTRACTS:—

"One of the fields of this farm, the property of MRS. STANBURY, was planted with Regents Potatoes in April last, some of which were prepared by you. The result now is, that the whole of the crop from the unprepared sets is thoroughly diseased, and hardly worth the trouble of taking up: while those raised by the side of them from the prepared sets are not only in a beautiful state of preservation from the disease, but the produce is much greater,—the Potatoes are more numerous than the others; indeed, if there were no such thing as the disease to be feared, it would be worth the trouble and expense of preparing the sets by your process, even for the sake of the improved crops. I shall certainly, for the future, prepare all my Potatoes for seed by your process; and I intend to adopt it for preserving my Wheat from the Smut.

"G. B. BAXTER.

"Pelmont Farm, Eltham, Kent, August 28, 1854."

"Admiral Sir J. A. GORDON, K.C.B., Marlee House, Blairgowrie.

"SIR,—I have received your note of the 16th. The Potatoes that came here from England, prepared by Mr. JACKSON, were planted in a piece of new ground, and according to the directions sent by him along with them as to distance between the plants, &c. They came up well, with strong healthy stems; we have now taken the whole crop up, and there is not the slightest appearance of any disease amongst them. They are of large equal size and very prolific. There were long black unprepared Kidneys planted in the same patch, and a great deal of them are not fit for use, at least a third part are diseased. I hope Mr. JACKSON's process may be widely known, as it is a great boon.—I am, &c.,

JOHN SHANKS,

"Forester, Kildrummy Castle.

"Kildrummy Castle, Aberdeenshire, November 17, 1854."

"I am very much pleased with the result of the experiments have made with your Prepared Potatoes; for I planted them, without any manure, in ground where for several years I have hardly had a sound Potato, and I now find the crop perfectly free from disease, and in a very fine condition: while those of the same sort, unprepared, which were planted at the same time, and next to them, are diseased and eaten by worms.

"The Potatoes from the Prepared Seed were so remarkably good that I was induced to weigh them, and I found, to my great astonishment, that they were as 200 to 150 of the others, or about 25 per cent. in favour of your preparation.

"T. AUSTEN, Nurseryman and Seedsman.

"Blackheath, Kent, 24th August, 1854."

Sold by Messrs. CHARLWOOD & CUMMINS, Seedsmen, Covent Garden; and JOHN KERNAN, Seedsman, 4, Great Russell Street, Covent Garden; all Seedsmen and Chemists; and at the Patentee's, 18, Cannon Street, London Bridge, in Packets of One, Two, Three or Four Pounds, or in Bulk for the use of Farmers and Potato Growers.

NEW AND FIRST-RATE PLANTS.

MITCHELL AND CO., having an extensive stock of the following plants, beg most respectfully to inform the Florticultural public that they are now prepared to supply on and after the 1st of May good healthy bushy plants, which cannot fail to give satisfaction to any purchaser.

GERANIUMS sent out last season in 48-sized pots, good blooming plants, 25s. per dozen, or the whole Collection 45s., consisting of Foster's Attraction, Cloth of Gold, Carlos, Rosa, Lucy, Rhoda, Purple Perfection, Sunrise, Lady Bird, Duchess of Wellington, Pilot, Lord Hardinge, Mogul, Splendidum, Hoyle's Regalia, Carlos, Virginia, Governor-General, Zeno, Mary, Rival Queen, Malcolm, Indian Chief, Tamberlik, Sans pareil, Eugenie; or smaller well established plants, in 60 pots, 18s. per dozen; or the whole Collection for 35s. All the best varieties of the previous season, good blooming plants, 12s. per dozen, or two dozen for 20s.

FANCY VARIETIES of last Season, strongly recommended as being very superior; the whole Collection for 30s., or any 12 for 21s.; good strong plants: Loveliness, Bonnie Lassie, Formosiana, Lady Hume Campbell, Ramosa, Lady Mary Labouchere, Argus, Ocean Queen, Odoratissima punctata, Constance, Madame Sontag, Lady Alice Peel, Bartlett's Dandy, Figaro, and Eminent.

FUCHSIAS.—The best Show Flowers, consisting of Clio, Duke of Wellington, Duchess of Lancaster, Queen of Hanover, Elegans, Fanny Webb, Splendens, Macbeth, Monteith, Omega, Magnifica, Monarch, Telegraph, Vanguard; good established plants, 6s. per dozen.

TREE OR WINTER FLOWERING CARNATION.—Our immense stock of this beautiful flower stands unrivalled in the Trade; good strong plants, our own selection, 6s. and 9s. per dozen.

PENTSTEMONS.—The following new and distinct varieties, 9s. per dozen, strong plants:—Magnifica, Campanulatus, Purpureus, Hybrida, Superbum, Grandis, Formosa, Azureum, Atrocæruleus, Speciosum.

BOUVARDIAS.—The following six distinct varieties are offered at 9s. per dozen:—Jaquini, Levigata, Aurantiaca, Splendens, Angustifolia, Hartelli.

BOUVARDIA LONGIFLORA.—The true white flowering sweet-scented variety, 2s. 6d. each.

PETUNIAS.—The 12 new and distinct varieties for 6s. per dozen:—Napoleon III., Elizabeth, Lady Tournor, Camoens, Pourpre, Royale, Queen of Roses, Crœsia, La Reine, Rotundia, Souvenir de Majestin, Rachen von Thuringen.

PINKS, consisting of Turner's Bragg's best Show Flowers, 4s. and 6s. per dozen; True Crimson Cloves, 6s. per dozen, good plants in pots; Prince of Denmark, fine scarlet Clove, 6s. per doz.

Geranium Flower of the Day, 6s. and 9s. per dozen.

Lysimachia Leschenaultia, 2s. 6d. each, or 18s. per dozen.

Hydrangea japonica variegata, 2s. each, or 18s. per dozen.

Alonso Warcsewiczii, first-rate new plant for bedding, 9s. p. doz.

Heliotrope Beauty of the Boudoir, very fine, 1s. 6d. each, 12s. doz.

GLOXINIAS.—The following 12 first-rate varieties for 21s., viz.:—Amabilis, Duke of Wellington, Repandens, Franki, Jushti, Imperalis, Black Prince, Josephine Beauharnais, La plus Belle, Pulcherrima, Leonie Van Houtte, and Marie Van Houtte.

DAHLIAS.—The new varieties of last season, our own selection, 9s. per dozen; good show varieties of older date, 4s. to 6s. per dozen.

VERBENAS.—The new varieties of 1854, 4s. per dozen, or six dozen for 21s.

The following collection are first-rate bedding varieties of Scarlets, 6s. per dozen—Boule de Neige, Bishopstowe, Commander-in-Chief, Kingsbury Pet, Miss Emily Field, Skeltoni, Trentham Rose, &c.

Shrubby Calceolarias, superior collection, 4s. per dozen, strong plants.

Phlox, General Radetsky, beautifully shaped variety, 6s. per dozen.

Phlox, herbaceous, consisting of the best varieties, 6s. per doz.

Delphiniums grandiflorum and Barlowi, 4s. per dozen.

Post Office Orders are most respectfully solicited from unknown correspondents, made payable to J. FAIRBROTHER.

*** Carriage paid to London, or any Station on the London and South Coast Railway, on all parcels of 20s. and upwards, with plants gratis to compensate for longer distances.

Bristol Nurseries, Kemp Town, Brighton.

GEORGE SMITH has much pleasure in offering the undermentioned strong Plants, which he is now sending out, and feels great confidence in recommending them as possessing first-rate qualities:—

VERBENAS.

BOULE DE FEU (Young), bright orange scarlet, with conspicuous lemon eye; pip large, of fine form, compact truss, of good size, the habit excellent, a most profuse bloomer, the finest scarlet ever offered. First class certificates at the National, Royal South London and North London Floricultural Societies.

LORD RAGLAN (Banks), crimson scarlet, large lemon eye, pip and truss large, of fine form. This will be found a noble variety.

EMPRESS (Smith), pure white, with conspicuous rosy purple centre, pip and truss large, smooth and compact. One of the very finest of the light varieties.

MRS. M'NIEL (Smith), brilliant rose with large lemon eye, truss and pip large, of exquisite form, and very beautiful. In the style of Beauty of Hornsey.

VIOLACEA (Smith), intense violet, with a very conspicuous large white eye, pip and truss large, of good form. This flower will be found most remarkable and beautiful, either for bedding or exhibition. It is something in the way of M. Paquin, with the colour much more intense, and a fine free grower.

SILISTRIA (Smith), pale lilac, shaded with rose, very large and compact. First class at the Royal South London Horticultural Society. The set of six for 24s., or 5s. per plant.

FUCHSIAS.

The following four Fuchsias are fine show flowers, plants of good growth, and very free blooming kinds that must be grown in all good collections:—

OMER PASHA (Smith), tube short and stout, sepals well reflexed, of bright waxy crimson scarlet, corolla deep violet purple, large, of good shape, fine habit, free in growth and profuse bloomer. A fine plant for exhibition. 7s. 6d.

ORLANDO (Smith), dark tube and sepals reflexed, with an intense dark corolla. 3s. 6d.

CORONET (Smith), white tube and sepals, corolla violet, good shape, very free. 3s. 6d.

NIMROD (Smith), white tube and sepals, corolla light purple, good form. Plant of strong growth, and a very free bloomer. 3s. 6d.

SCARLET GERANIUMS.

BEAUTY OF COMB BANK, intense scarlet, eye white, pips large and circular, truss very large, dwarf habit, with horseshoe foliage. A first class bedding variety. 5s.

CHEPSTEAD BEAUTY, fiery crimson scarlet, extra large and fine, foliage very beautiful, habit dwarf, and free bloomer. One of the finest scarlet Geraniums ever offered. 5s.

CERITO, salmon rose, truss and pip large. A novel and pleasing variety. Was exhibited at the National Floricultural Society, where the judges would have awarded it a first class certificate had the plant been exhibited. 5s.

PETUNIA.

SINGULARITY (Smith), a novel and striking variety, corolla two-thirds downward bright green, throat rose, flower extra large, the habit of Prince Albert, a pleasing variety. 5s.

Choice Verbena Seed, 2s. 6d. per packet.

A Priced and Descriptive Catalogue of first-class Verbenas, Geraniums, Fuchsias, Hollyhocks, Dahlias, Chrysanthemums, and Petunias, will be forwarded in exchange for one stamp

Tollington Nursery, Hornsey Road, Islington, London.

SUPERB SHOW CARNATIONS, PICOTEES, PINKS, PANSIES, ETC.

25 pairs of Show CARNATIONS in 25 different vars.		£1	0 0
25 pairs of PICOTEES	do. do. ...	1	0 0
25 pairs of PINKS	do. do. ...	0	10 0
25 fine show PANSIES, in 25 distinct varieties	...	0	12 0

AURICULAS, ALPINES, POLYANTHUSES, &c. Extra fine selected PANSY SEED, 1s. and 2s. per packet. Priced and Descriptive Catalogues are now ready, and may be had for one postage stamp. Post office orders to be made payable at Middleton, Lancashire.

The FLUKE KIDNEY POTATO, TRUE, 5s. per bushel of 56 lbs.

NORTH AMERICAN HERBACEOUS PLANTS.

HUGH LOW AND CO. have to offer the undernamed, which are all in a very healthy condition. The Trilliums are now in flower, and several others will flower during spring—the Cypripedium and Viola palmata now showing flower buds. Amongst the plants now offered will be found many varieties, and attention is particularly called to the Sarracenias, which are strong and vigorous, imported during the past winter direct from their native localities.

Clapton Nursery, London, April 28.

ROBERT PARKER begs to inform his friends and the public that his New Spring Catalogue containing Descriptive and Priced Lists of the following:—

Exotic Orchids
Ferns—stove, greenhouse, and hardy
Geraniums—show, fancy, scarlet, variegated, and hybrid bedding varieties
Chrysanthemums—large flowered, and Pompone varieties
Petunias
Antirrhinums
Roses in pots
Dahlias—show and fancy varieties
Fuchsias
Selaginillas or Lycopodiums
Gloxinias
Cinerarias
Calceolarias—bedding varieties
Verbenas
Miscellaneous bedding plants &c., &c.

Is now ready and can be had Post-free on application.

Paradise Nursery, Hornsey Road, Holloway, London.

MESSRS. E. G. HENDERSON AND SON beg to announce that in consequence of their inability to supply plants of sufficient strength so early in the season, two of the new Fuchsias will not be sent out this year, consequently the set will now only be 3l. 3s.

Empress Eugenie.	Lady of the Lake.
Mrs. Story.	Queen Victoria.
Prince Albert.	Raffaelle.
Snowdrop.	Water Nymph.

Orders for the above can only be booked and executed in rotation after the earlier orders are despatched.

THE NEW SPRING CATALOGUE

Will shortly be published and forwarded post free on application. Parties wishing for the same will have their names booked.

A COLOURED PLATE,

Composed of a group of Nine new Flowers belonging to the Stove, Greenhouse, and Garden. It will be sufficient to say that Mr. Andrews, the eminent floricultural artist, has them in course of preparation, and under his superintendence full reliance may be placed on their accuracy; any one wishing for the same will have their names booked for it, to be sent them when finished, by forwarding 12 postage stamps; and if ordered in time will be stitched-in and sent with their new Spring Catalogue. This notice also applies to any nurseryman that may wish to have the Plate.—Wellington Nursery, St. John's Wood, April 28.

NEW AND CHEAP PLANTS.

THE CHEAPEST ESTABLISHMENT IN THE KINGDOM FOR PLANTS IS AT

HENRY WALTON'S, Edge End, Marsden, near Burnley, Lancashire, where there are propagated annually from 20,000 to 30,000 plants for sale, which for cheapness and quality are not to be equalled. Parties desirous of possessing a choice collection of good plants would do well to select from the following:—

GERANIUMS, new varieties, strong autumn-rooted plants, purchasers selection, 30s. per dozen; H. W.'s selection, 25s. per dozen, viz.—Attraction, Carlos, Duchess of Wellington, Empress, Eliza, Glowworm, Helen, Indian Chief, Leah, Lucy, Mrs. Hoyle, Marginata, Mary, Neatness, Picta, Rebecca, Regalia, Rosa (Foster's), Rhoda, Tamberlik, Virginia, and Zeno. Extra strong choice older varieties, 9s., 12s., and 15s. per dozen; 25 for 20s.; 50 for 35s.

FUCHSIAS, new varieties of last season, spring struck, 7s. 6d. per dozen; autumn struck, 9s. per dozen, post free, viz.—Admiral, Autocrat, Clio, Duke of Wellington, Elegans, Fanny Webb, Grandissima, Globosa Splendens, Henry Monteith, Macbeth, Magnifica, Monarch, Mr. Charles Palmer, Omega, Queen of Hanover, Telegraph, Trentham, and Vanguard.

CINERARIAS, choice new varieties, 12s. per dozen, or 6 for 8s., viz.—Advancer, Etoile de Vaise, Estelle, Empress Eugenie, Exquisite, Garland, Lady Camoys, Lord Stamford, Lablache, Mrs. Seagrave, Mrs. Beecher Stowe, Novelty, National, and Polyanthiflora. Choice varieties of previous years, 6s. and 9s. per dozen.

PANSIES, the following choice select varieties, 12s. per dozen, or the set of 22 for 18s.—Duke of Perth, Eldorado, Flower of the Day, Golden Eagle, Kate, St. Andrew, Sovereign, Emperor, Fearless, Lord Walsingham, Ajax, Owen Glendower, Prince Albert, Rubens, Rising Sun, Sir William Wallace, Lady Bute, Miss Jane, Mrs. Oswald, Marchioness of Bath, Yellow Climax, and Charles Turner. Good older show varieties for 4s. 6d. and 6s. per dozen.

VERBENAS, new varieties of last season, 7s. 6d. per dozen.

New PETUNIAS of last season, 9s. per dozen.

CARNATIONS and PICOTEES, 50 superior sorts, named, one pair of each, 2l.; 25 do., one pair of each, 1l.; or 9s., 12s., and 18s. per dozen pairs.

PINKS, 4s. 6d., 6s., 9s., 12s., and 18s. per dozen pairs.

HOLLYHOCKS, a choice selection of strong healthy plants, 12s., 18s., 24s., and 30s. per dozen, H. W.'s selection.

DAHLIAS, in May, new varieties of last season, 9s. and 12s. per dozen; older varieties 4s. 6d. to 6s.

A choice selection of Bedding Plants, including Scarlet and other Geraniums, Heliotropes, Pentstemons, Cupheas, Salvias, &c., equally cheap.

H. W.'s Spring List is now ready, and may be had for one postage stamp.

It is respectfully requested that all Post Office Orders be made payable at Marsden, Lancashire; and a remittance or satisfactory reference expected with all orders from unknown correspondents. All orders to the amount of 25s., carriage free to Liverpool, Manchester, Leeds, and Preston; 2l. and upwards, carriage free to Birmingham and Carlisle; for more distant carriage, extra plants will be given gratis.

PATTERSON'S SCARLET NONPAREIL STRAWBERRY

JAMES VEITCH, JUN., begs to inform the public that he has still on sale a limited number of strong well-rooted plants of the above fine Strawberry. It was exhibited at Chiswick on Saturday, June 3, 1854, and received the Silver Knightian Medal; it has also been submitted to Dr. Lindley, Mr. Marnock, and Mr. Thompson, all of whom report most favourably of its merits. It is a *first-class forcing* Strawberry in character, intermediate between *its parents—Keen's Seedling* and *Pentagon*, of the vigorous habit of the *former*, and fully one week earlier in ripening; and in the quality of its fruit *fully equal* in flavour to, if not superior, to the latter. The fruit is of a large size and handsome shape, of a *bright red colour*, and with a remarkably fine perfume. 100 Plants, 3l.; 50 Plants, 2l.; 12 Plants, 12s.

Exotic Nursery, Chelsea, April 28.

J. CATTELL has much pleasure in informing the admirers of the Heliotrope that he will send out after the 12th of May a superb Seedling, named "HELIOTROPIUM JOHN CATTELL." The colour is a beautiful lively bluish purple, with a light lavender towards the bottom of the cup, the heads of flower stand erect, and are very large: the leaves are broad, and a good green, having none of the objectionable black colour of Voltaireanum and kindred varieties, while the habit is superior to any other. From the size of the flowers, the bold manner in which the head is produced, together with the pleasing colour and excellent habit of the plant, J. C. is quite confident that this variety, when it becomes known, will supersede every other for general purposes. Strong Plants, post free 7s. 6d. each. A liberal discount to the trade.

A remittance or reference in London must accompany orders from unknown correspondents.—Nurseries, Westerham, Kent.

CHOICE BEDDING PLANTS,

AND

TO THOSE ABOUT PERMANENTLY REPLENISHING THE FLOWER GARDEN.

YOUELL AND CO. beg to submit the following List of desirable PLANTS, suitable for the above purpose. Carriage paid on all Orders of 2l. and upwards to any distance within 150 miles of the Nursery, and good Plants added to compensate for this charge on packages of less value:—

Dandy ...	... 9s. "	Mountain of Light	18s. "
Golden Chain	... 18s. "		

GERANIUM—Boule de Neige, a unique white-flowering, horseshoe leaf variety, producing large trusses of well formed flowers, 9s. per dozen.
" Kingsbury Pet, a striking variety, bearing a fine truss of bright salmon-coloured flowers, 9s. per dozen.
" Manglesi Floribunda, a free blooming light variety, 9s. per dozen.
" Crimson Unique, for bedding purposes, a fine strong growing variety, 9s. per dozen.

LOBELIA Cacemoides, the best dark blue variety, 4s. per dozen.
" lucida do. light do. 4s. "
" compacta alba do. white do. 4s. "
" Lindleyana, a decided lilac do. 6s. "

VERBENAS.—In this class particular attention has been given to introduce only those of the more striking colours and best habits for bedding purposes; these include all the handsomest of the new continental varieties, and we offer them at 4s. per dozen, or 30s. per 100.

PHLOX NELSONI.—An extremely pretty and hardy variety, originated through the zeal of an amateur in this country, whose name it well bears. It is of dwarf trailing habit, producing a dense mass of large pure white flowers with puce-coloured eye, 1s. 6d. each.

TROPÆOLUM—Triomphe de Gand—a handsome variety for trellis work, producing large and brilliant scarlet flowers, 12s. per dozen.

CLEMATIS TUBULOSA MANGLESI, a handsome herbaceous plant bearing numerous heads of blue star-shaped flowers, very hardy, 9s. per dozen.

ROCKETS, new double crimson, 9s. per dozen; old double white, 3s. per dozen.

PRIMROSES, double white, 4s. per dozen; double crimson, maroon, 12s. do.; double yellow, 5s. do.; double purple, 4s. do.

PHLOXES.—The following choice varieties 9s. per dozen: Maria Boulanger, Striata superba, Roi Leopold, Villaret [illegible], Bois Rose, Imbricata, Macrantha, Deuil de la Comtesse de Morny, Anais, Eliza, Mrs. Thompson, Madame Courcelles, Madame Frobel, Madame Lanier, Madame de Pruines, Gen. Lamoricière, Princesse de Cleres, Princesse Marianne, and other fine kinds.

HOLLYHOCKS, extra fine, first-class show varieties by name, 12s. to 18s. per dozen.

BELGIAN DAISIES in 36 best kinds, by name, 4s. per dozen.

PÆONIAS in 20 new and very choice Continental varieties for 1l.

Dielytra spectabilis; this universal favourite, strong flowering plants, 9s. per dozen.

Delphinium Barlowi, 9s. per dozen.
" Mooreanum, an extremely beautiful variety, 12s. per doz.
" grandiflorum maximum, 9s. per dozen.

Saponaria ocymoides, 6s. per dozen.

Statice maritima rosea, a very pretty, hardy herbaceous plant of dwarf habit, producing numerous heads of bright rose-coloured flowers, 6s. per dozen.

MIMULUS in 6 new and choice varieties, 6s. per dozen.

POTENTILLAS in fine variety, 6s. per dozen.

Lilium lancifolium album, 9s. per dozen; rubrum, 20s. per dozen.

Lobelia Feu du Roi, St. Clair, and Aurora, 9s. per dozen.

Herbaceous Plants in very choice variety, 30s. per 100; 4s. per dozen.

YOUELL & Co., Royal Nursery, Great Yarmouth.

AMERICAN NURSERY.

GEORGE BAKER'S DESCRIPTIVE CATALOGUE OF AMERICAN PLANTS, &c., as exhibited by him in the Royal Botanic Gardens, Regent's Park, may be had on enclosing two postage stamps.

G. B. begs to call attention to his fine stock of Weeping Conifers, Coniferous Plants, Ornamental Shrubs, &c.—American Nursery, Windlesham, near Bagshot, Surrey, near Staines Station, South-Western Railway, where conveyances may be obtained.

J. COLE begs to inform the admirers of Calceolarias that he is now prepared to supply a few more orders from his Choice Stock of Unblooned SEEDLINGS—the seed was saved from the choicest spotted and striped varieties, carefully impregnated—at 3s. and 4s. per dozen, 20s. and 25s. per 100. Also strong plants of his Fine Bedding Calceolaria Prince of Orange, for habit and profusion of bloom unequalled. Strong Plants without pots, 6s. per dozen; well established, 9s. per dozen. The Trade liberally supplied. A Remittance solicited from unknown correspondents. Post-office Orders payable at St. Alban's.
Keyfield Nursery.

NEW DAHLIAS AND OTHER PLANTS.

THOMAS BARNES begs to announce that he will commence sending out (from a very fine healthy stock) on the 1st of May, his new superb Dahlia Warrior, and Ablitt's incomparable, both of which are very fine crimson, though perfectly distinct, 10s. 6d. each, with all the leading Dahlias of last and former years at moderate prices. His Catalogue, with descriptions and prices, may be had on application, which includes Dahlias, Fuchsia, Verbenas, Phloxes, Chrysanthemums, Roses, Pansies, Daisies, Petunias, and Miscellaneous Plants. Also his new Scarlet Pelargonium, Dawn of Day, which T. B. is now sending out.—Dane Croft Nurseries, Stowmarket.

SPLENDID NEW HOLLYHOCKS.

G. SMITH respectfully informs the admirers of the HOLLYHOCK that the following are Seedlings of great merit, and cannot fail to give entire satisfaction. They were raised by Mr. Parsons, the grower of Joan of Arc, and other fine varieties. To be sent out about the middle of April, 1855, in strong healthy plants.

	s.	d.
Zelat, yellow and buff, a nice full flower	3	6
King of Yellows, large, of fine form, flower full, extra fine yellow	7	6

VERY SUPERIOR FIMBRIATA PRIMULA SINENSIS SEED, saved from six distinct varieties of the largest and most beautiful plants ever grown, 2s. 6d. per packet.

PANSY SEED, a few packets from selected varieties, 1s. per packet.

CALYANTHUS SEED, fine mixed, 1s. per packet.

BROWN GOURD, or CUSTARD MARROW; this variety is the most delicious of all the Marrows grown, 1s. per packet.

AQUILEGIA, or COLUMBINE, of 12 distinct varieties, 1s. per packet.

Any three packets of the above (except the Primula) sent post-free on receipt of 2s. 6d., or the Primula included with two other packets for 3s. 6d., in cash or penny postage stamps by
EDWARD TILEY, NURSERYMAN, SEEDSMAN, AND FLORIST,
14, Abbey Church Yard, Bath, Somerset.

EUONYMUS; OR, THE "BURNING BUSH" OF NORTH AMERICA.—The advertiser has just returned from America, and brought with him a few Seeds of the above rare and beautiful hardy ornamental small tree. It grows from [illegible] feet high, and of an uniform bushy, compact habit, quite unlike any of the varieties known in English gardens. For four months in the autumn it is densely studded with its beautiful scarlet seeds, which makes it an object of the most striking and remarkable character, and hence the name "BURNING BUSH" has been given to it by the natives. The advertiser's knowledge of plants and their worth enables him to say that hundreds of plants have been sent out as being hardy and ornamental, whose value to the "Burning Bush" 50 perfect seeds will be forwarded post free, on receipt of 50 postage stamps, addressed to A. B., 12, Great Pulteney Street, Golden Square.

A Specimen of this charming plant will be shown at the Monthly Meeting of the Horticultural Society, 21, Regent Street, London.

NEW AND RARE CONIFERÆ.

PETER LAWSON AND SON, the QUEEN'S SEEDSMEN, Edinburgh and London, have still on hand a small quantity of the Seeds of the following RARE CONIFERÆ, &c.:

	£ s. d.		£ s. d.
Pinus Lambertiana, 50 Seeds	1 5 0	Taxus Lindleyana (quite new) 50 Seeds ...	2 2 0
P. tuberculata, entire cones	2 2 0	Club-headed Wheat (cultivated by the old Californians) 200 grains	1 0 0
P. monticola, 50 Seeds ...	2 2 0	Wheat (a variety of Triticum durum) do.	15 0
P. Jeffreyi do. ...	2 2 0		
P. Beardsleyi do. ...	2 2 0		
Libocedrus decurrens, do.	1 5 0		

Full descriptions will be found in the last page of the *Gardeners' Chronicle*, for Feb. 3.—Orders may be addressed to PETER LAWSON & SON, in Edinburgh; or to their London House, 27, Great George Street, Westminster.

GERANIUMS—CHEAP AND GOOD.

W. H. WHEELER, FLORIST, Hendon, Middlesex, offers a choice of the following at 21s. per doz.:—Medora, Enchantress, Sunrise, Governor-General, Pilot, Carlos, Colonel of Buffs, Hero, Supreme, Optimum, Magnet, Mochanna, May Queen, Virgin Queen, Magnificent, Forget-Me-Not, and Village Maid. Older varieties at 6s. per doz.; Scarlet Geraniums, 3s. per doz.; Miss Emily Field (White) 12s. per doz.; Skeltoni and Kingsbury Pet, 9s. per doz.; Verbenas out of pots now, 2s. per doz. All other Bedding Plants equally cheap.

NEW PLANTS IN FLOWER.

MESSRS. E. G. HENDERSON AND SON, of the Wellington Nursery, St. John's Wood, London, beg to announce that the following plants are now in flower, and may be seen in their winter garden:—

Camellia Marie Antoinette	Azalea Juliana
" Ariosto	" alba illustrata
" Mathotiana	" admiration
" alba pleno of Casoretti	" narcissiflora
" alba illustra	Rhododendron campylocarpum
" Catherine Longhi	" Dalhousieanum
" Comte de Paris	" Edgworthi
" Don Michel	" ponticum coccineum
" Innocenza	Cyclamen persicum, new collection
" Madonna	Rhododendron, new seedling
" Ristori	Camellia de la Reine
" Verschaffeltiana	Genetyllis macrostegia (Fuchsioides).
" Sarah Frost	Bouvardia longiflora.
" General Drouot	
Azalea Criterion	

Wellington Nursery, St. John's Wood, London.—April 28.

HUGH LOW AND CO. have now ready for Sale young Plants of the undernamed new VERBENAS, which are the cream of the Continental Collections of the present season. Price 1s. 6d. each:—

Arago, violet bronze	Gloire de France, vermilion, large truss [white eye
Adrienne, pink, purple eye	Jerome, crimson, black centre,
Coleman, velvety crimson	Laurentine, pink, cream eye
Duc d'Almeida, crimson, centre very dark	Mariette, violet, white eye
Eulalie, violet pink, cream eye	Menschikoff, crimson red, white
Flore, rose, red eye [white eye	Paul de Kock, very dark [eye
Florian, crimson, brown centre,	Savenay, lilac, purple centre

Heliotrope climax; this variety, now offered for the first time, is of great merit, and will prove to be the best for bedding out in the Flower-garden. Price 3s. 6d.

H. Low & Co. have now ready a very large stock of Soft-wooded Plants of all kinds suitable for decorating the Flower-garden during summer, at prices which cannot fail to suit purchasers. All the Plants are grown singly in small pots, which can be packed securely in a very small compass.

Parties requiring large quantities will be liberally treated.

Clapton Nursery, London, April 28.

NEW ROSES IN POTS.

WILLIAM WOOD AND SON have to offer fine Dwarf Plants of the following:—

HYBRID PERPETUALS.—	s. d.	HYBRID PERPETUALS.—	s. d.
Baron Laray	7 6	Monsieur Pigeron... ...	10 6
Cicero	5 0	Panaché d'Orléans ...	10 6
Comtesse d'Orléans ...	7 6	President Menoux ...	7 6
" Vaillant ...	7 6	Prince de la Moskowa ...	5 0
Deuil de François Willermoz	7 6	Souvenir de Leveson Gower	5 0
Duchess of Norfolk ...	10 6	" des Braves ...	3 6
Empereur Napoleon (SEMI DOUBLE)	7 6	Triomphe en Beauté ...	2 6
Evêque de Meaux... ...	10 6		
General Bréa	2 0	Bourbon, Ferdinand Deppe	7 6
Jules Margottin, 2s. 6d. to	3 6	" François Henrique	5 0
Julie Guinoisseau ...	10 6	" Omer Pacha ...	7 6
Lafontaine	7 6	Tea, Auguste Vacher ...	3 6
La Ville de St. Denis ...	3 6	" Barillet Deschamps	5 0
Léon Haimann	7 6	" Gloire de Dijon, 3s. 6d. to	5 0
Lord Raglan	10 6	" Laurette (Belle Laure)	3 6
Madame de Cambacères (splendid)	10 6	" Madame Maurin ...	3 6
Madame de Trottaire ...	5 0	China, Lucullus	7 6
" Domage, 2s. 6d. to	3 6	Perpetual Moss, Salét ...	7 6
" Hector Jacquin .	5 0	Noisette, Augusta, 7s. 6d. to	10 6

" Rendatler ...	3 6		

N.B. The new Hybrid Perpetual Rose Emperor Napoleon will not be sent out before June; by that time I shall have proved it. If not more than semi-double, I much question if it is worth 7s. 6d. I, however, received a very high character of it, which induces me to offer it to the public, *but not to let it out before proving its worth.*

Carriage paid to any Station on the Eastern Counties Railway.
St. John's Street Nursery, Colchester.

FLOWERING PLANTS.

F. AND A. SMITH beg to offer FLOWERING PLANTS of the following (in quantities to the trade):—Geraniums, Fuchsias, Verbenas, Heliotropes, Calceolarias, Hydrangeas, Roses, Cactus, Ericas, Burchellia, Kalosanthus, Neriums, Scarlet Geraniums, &c. Prices on application. The Plants are stocky and in good condition: an inspection solicited.—Dulwich, Surrey.

NEW AZALEA—"ALBA MELIOR."

THIS is the one exhibited by us under the name of "ALBA MAGNA" among our collection to which the First Prize was awarded at the Regent's Park Show; very large pure white, and quite first-rate. Price 7s. 6d., 10s. 6d. to 21s. each. Also a superior stock of Azaleas, for which see Catalogue.

The Spring Catalogue, consisting of Greenhouse and Stove Plants, and the Herbaceous one can be had by enclosing one postage stamp.

H. LANE & SON, The Nurseries, Great Berkhamsted.

ORCHIDS.

WILLIAM MAULE AND SONS have received their annual importations of ORCHIDS from their collectors in the East, which they beg to offer on the following terms, many of which are one and two years established:—Vanda cærulea, 21s., 42s., 63s., 105s.; Vanda teres, 10s. 6d.; Aerides odoratum, 10s. 6d.; Aerides affine, 42s.; Foxbrush, 105s.; Dendrobium Devonianum, 10s. 6d.; Cambridgeanum, 10s 6d.; Gibsoni, 10s. 6d.; densiflorum, 10s. 6d.; Farmeri, 10s. 6d., 15s.; Chrysanthum majus, 7s. 6d.; nobile, mixed with Wallichi, 7s. 6d.; Pierardi, mixed with latifolium, 7s. 6d.; clavatum, 15s., 21s.; mosohatum, 10s. 6d.; Camarotis purpurea, 10s. 6d.; Cœlogyne or Pleone, Wallichi, and maculata, in pots, with four or five plants or bulbs, 10s. 6d. each; Saccolabium ampullaceum (VERY scarce), small plants, 63s. each. The Nurseries, Bristol.

WHEELER AND SON'S SHORT SELECT SEED LIST.—Our Priced List of Seeds for this season, containing Descriptions and Prices of the best GARDEN and FLOWER SEEDS, will be forwarded free by post. It is our earnest endeavour to send out all Seeds, whether for the Garden or Farm, of the very best quality and true to name; and as many of the Seeds are our own growing, and are proved before sending out, we generally succeed in giving entire satisfaction to our customers.

We are in daily receipt of most gratifying letters and renewed orders from those we had the honour of serving last year; and as we deliver our Seeds CARRIAGE FREE, we very respectfully solicit the honour of an order from those who have not yet given us a trial.—J. C. WHEELER & SON, Gloucester, Seedsmen to the Gloucestershire Agricultural Society.

WELLINGTONIA GIGANTEA.—Ample description of this noble tree having appeared in former advertisements or circulars, it is only necessary now to say that it is a Coniferous Tree, of immense dimensions and great beauty. It having withstood the severity of the past winter, without injury, both at Chelsea, Exeter, and various other localities, there can be no doubt of its being a perfectly hardy tree, thus rendering it the most remarkable of recent introductions.

MESSRS. VEITCH & SON can supply healthy well established plants at the following prices:—

A few of the first raised, extra sized plants ...	42s.	0d.
Second size	31	6
Third size	21	0

A reduction will be made on the above prices in proportion to the quantity taken.—Prices to the Trade on application.

Nurseries, Exeter and Chelsea.—April 28.

TO BE SOLD CHEAP, price 60*l.*, a small private Collection of ORCHIDS (180 Plants).—Apply to Messrs. FRASERS' Nurserymen, Lea Bridge Road, Leyton, Essex

---

JOHN KERNAN begs to offer the following list of AGRICULTURAL SEEDS:

Agricultural Carrots, Red and White, 1s. per lb.

Mangold Wurzel, of sorts.	Italian Rye-grass (imported).
Skirving's Swedish Turnip.	Mixed Permanent Grasses.
Laing's Purple-topped do.	Parsley for Sheep-walks.
Ashcroft Purple-topped do.	Cattle Cabbage.
Green-topped do.	Thousand-headed do.
Yellow Bullock do.	Clover, Red and White.
White and Red Globe do.	Trefoil and Lucerne.
Dale's Hybrid do.	

The Trade supplied. Seeds carefully packed for all climates. Catalogues may be had on application.

4, Great Russell Street, Covent Garden.

SUPERIOR WHITE BELGIAN CARROT SEED.

SUTTON AND SONS have some remarkably fine seed of this useful root. Whereas much of the Carrot Seed selling this season is acknowledged to be of inferior quality, Messrs. SUTTON & SONS having tested theirs, find it to germinate as well or better than any they have ever sold. Price according to quantity required.—Address SUTTON & SONS, Seed Growers, Reading, Berks.

The Gardeners' Chronicle.

SATURDAY, APRIL 28, 1855.

MEETINGS FOR THE ENSUING WEEK.
TUESDAY, May 1—Horticultural (Anniversary)..... 1 P.M.

WE are authorised to state that Mr. COLE, in charge of the British section of the Paris Universal Exhibition, has prepared cards to admit the correspondents of the *Gardeners' Chronicle* to the opening on the 1st May, and that these cards will be ready for delivery on Monday, the 30th April, at the English Office, No. 14, Rue du Cirque, Paris.

SOME inquiries addressed to us by a correspondent upon the subject of GARDEN WALLS lead us to believe that many besides himself will be glad to have some practical information concerning them, which, if not novel, may be relied upon as being sound.

Various heights have been proposed as the best for garden walls. Some have suggested that they should be as low as 8 feet above the surface of the ground; others that they should be as high as 16 or even 18 feet. For general purposes, however, 12 feet may be considered a good height; it corresponds with that of the fruit walls in the Royal Gardens at Frogmore, and with most of those devoted to fruit trees in the garden of the Horticultural Society. Some are of opinion, however, that a height of 10 feet is sufficient, and for the following reasons, viz., that a wall of that height can be sooner covered by trees than one can possibly be that is as high, or higher, than is above recommended; that

10 feet is a convenient height for training and other operations connected with the management of wall trees; that against a long and comparatively low wall more trees could be planted against a certain amount of brickwork, with the certainty of the whole being covered, some years before this would be the case with the upper portion of a high wall; and certainly all these allegations favour the conclusion that it is better and more economical to have any given amount of brickwork in the form of a long and low wall than the contrary.

In determining the best height for garden walls, however, other considerations must be taken into account besides those just mentioned. For instance, there would be little or no use in building garden walls higher than would constitute a good fence, were it not for the necessity of affording a better climate for fruit trees than that of the open ground. This is the all important point which should be kept in view in the construction of garden walls; and the question may be asked how is this affected by the greater or less height of a wall?

We are not aware that experiments have been made to ascertain by means of thermometers the exact difference of temperature in front of high and low walls in the same locality. It is, however, well known that fruit ripens better against the former than against the latter. In a locality where the Orange tree would die in Britain, planted out against a rock-work terrace of only a few feet in height, it has lived many winters on a rocky steep, in the shape of terrace above terrace to the height of 30 feet or more, surmounted by the mansion, which also reflects heat from a frontage 300 feet in length. In short, the higher the wall, the greater the warmth in front of it, all other circumstances being equal. To produce the desired effect, garden walls should therefore be higher in a cold climate than in the naturally warmer southern counties. A high wall best fulfils the object for which fruit walls are built, and it is therefore to be preferred to a low one; in point of efficiency it is infinitely superior to the latter. A wall 12 or 14 feet high may certainly be naked near the top for a few years longer than one 8 or 10 feet high, but the additional height is not lost whilst it contributes to the perfect ripening of the fruit below. It is, in fact, better to insure perfectly ripened fruit on a wall, say 12 feet high, than to reduce the height one-fourth or one-sixth, and add it to the length, at the same time rendering the whole inadequate to ripen fruit in perfection. Where the means are ample and the climate indifferent, south-aspect walls more especially may be advantageously built higher than 12 feet; but as much as this at least should be generally aimed at. There are many old walls, on good foundations, considerably lower than this, which might have some additional courses of bricks put on them before next winter, in the full assurance that by so doing a permanent improvement would be effected.

With regard to thickness, we should prefer a 14-inch hollow wall built of good bricks and mortar to any other. It is about $\frac{1}{4}$ or $\frac{1}{5}$ cheaper than a solid wall of the same thickness, and it is drier, and consequently warmer than a solid wall. It may be heated by hot-water pipes; but if so, care should be taken to have ready means of access to the joints in case of leakage; and precaution should also be taken to empty the water out of the pipes before winter, otherwise frost might burst them, unless that is guarded against by covering them or by applying a little fire-heat. Hollow bricks do not appear to be either applicable or necessary for garden walls, especially where the latter are built hollow, for in this case the two sides, being only 4½ inches thick, require to be of solid materials.

Contact with any metallic substance is more or less injurious to vegetation, and therefore training to galvanised wire, or to any other kind of wire, should in all cases be avoided as much as possible. In dispensing with these, however, there is no necessity for battering down walls with hammer and nails: the mortar should be good enough to hold the latter, of which as few should be used as possible; most nails are required for the smaller shoots, and to hold wood of that description the nails need only be driven in a very little way, so that the joints may require fresh pointing not oftener than once in 50 years, and then the face of the bricks having been preserved, the wall will be as good as new. If nail-holes are made in the bricks themselves, insects are very apt to choose such cavities for their habitations, from which they cannot easily be dislodged without washing over with cement, and this renders the wall unsightly; but such holes in the mortar joints can be occasionally sealed hermetically by some fine lime-cement without producing any bad appearance.

Excellent concrete for foundations of walls is formed of materials consisting only of lime, gravel, or sand, and water. On such a composition cottages and palaces are founded, and nothing better can be employed for a wall against which trees are to be planted; roots like it, and creep along it with safety. This being the case, there is certainly no necessity for introducing into foundations gas-tar, a pernicious substance which some have thought of using.

As to protection, those who have woollen netting may employ it with advantage; it forms excellent material for the purpose—perhaps the best of any. The coping should project 2 inches, and should have a groove or throating on the under side, so that the drip may fall clear of the face of the wall.

Peaches, Nectarines, Apricots, Cherries, and Plums may be planted against walls, from 15 to 18 feet apart. Pears should stand 20 feet.

Some years ago a discussion arose at the Cambridge Philosophical Society about the transport of certain seeds from island to island. As is usual on such occasions many theories were broached, in the midst of which it was suggested that it would be as well to try first whether the seeds were capable of floating. In a similar spirit of good sound practical sense, Mr Darwin, who is engaged in many interesting matters relative to the distribution of vegetables over the world, both in modern and more distant geological times, has through the medium of our journal requested information as to the capability of germination in seeds after immersion in sea-water, and the nature and affinities of those which are able to endure such immersion. A mass of valuable information might easily be obtained if some ten or more of our readers would comply with Mr. Darwin's request. It is scarcely probable that they will have information on the subject which is at once available; but nothing would be easier than to obtain it if some such plan as the following were adopted—a plan which we have ourselves put in execution.

Sixty bags of strong muslin about 1½ inch square were prepared, with seams sufficiently large to insure the preservation of the seeds. These were divided into three sets, one for Monocotyledons, a second for Dicotyledons, and a third for corn and miscellaneous vegetables. Each bag was accurately numbered and its contents registered, but as the numbers might be washed out by the salt water, the bags were regularly arranged in order, each set of 20 being kept separate, and a button sowed to number one to prevent any possibility of mistake. The seeds were such as would most probably come up in the garden, and in one case consisted of flower and vegetable seeds from the Horticultural Society and of Monocotyledons from Kew. All these have been sown and accurately labelled, with a view to ascertain the fact that they are capable of germination under ordinary circumstances, and the bags are now sent off to the sea, with a request that they may be immersed in some safe place, where they can constantly have a fresh supply of water, without the chance of being injured by the waves. On their return, the whole will be sown, and the result accurately noted, all cases being rejected as useless in which the seeds have not germinated in the garden. It would have been desirable to have experimented with tropical seeds, especially of some of the Leguminous plants, whose fruit is often wafted across the ocean, but materials were not at hand. The experiment, however, will still be useful as regards the distribution of plants in temperate climates.

A similar set of experiments, conducted with care and accuracy, could scarcely fail of leading to some positive results, and we strongly press the matter upon the attention of our more scientific readers. *M. J. B.*

VEGETABLE PATHOLOGY.—No. LXIX.

303. Chlorosis (*Constitutional and Functional*).*—1. Chlorosis of Cacti.—One of the most striking examples which can be adduced under this head is a disease which has been recorded by Meyen as extremely common amongst the Cereus division of the Cacti in Germany. I have had no opportunity of inspecting this personally, and therefore must be content to borrow the account of Meyen, for a somewhat similar affection which is common in England amongst the Phyllanthoid Cacti does not seem to be identical, but appears rather to accord with ordinary cases of chlorosis arising from bad and inattentive cultivation.

304. In Meyen's disease the whole plant seems to have acquired an inveterate condition, which renders it utterly unfit to perform its proper functions. Not only do particular parts assume a yellow tint, and that not by any change of chlorophyll from green to yellow, for parts of every new shoot are equally colourless, and though it increases in dimensions, the constituent cells never attain perfection. Pruning, consequently, does not remedy the mischief, and if an attempt is made to propagate it, the cuttings will not throw out roots, whereas in the Phyllanthoid Cacti mentioned above, aerial roots are thrown out in abundance. Meanwhile the disease is slow in its progress, and it is only after a lapse of some years, after the fashion of those large Cacti imported from South America which refuse to throw out any fresh roots after being placed in our stoves, that the plant has ceased to live, unless indeed it has been subjected to a low temperature, of which these chlorotised plants are peculiarly impatient. The most careful treatment is wholly unavailing; stimulating manures or liquids however judiciously applied are without result, and death seems surely but invariably to ensue. Indeed, as a general rule, all propagation from chlorotic individuals should, if possible, be avoided. Where propagation is possible, which is far from being generally the case, there is little hope of favourable results, at least in all those cases where the evil does not arise from the depravation of existing chlorophyll, but from the inaptitude of the tissues to generate that essential element. The evil, from whatever cause it may originally be induced, seems to be as inveterate as a strumous habit in man, which is almost sure, sooner or later, to develop itself into some external or internal form of scrofula; or even should it by favourable or accidental circumstances be arrested during the life of an individual, it will break out unmistakably in the second or even in the third generation.

305. 2. Chlorosis of Hyacinths.—This disease is reported by Bouché in the "Allgemeine Gartenzeitung" for 1837, but I have in vain attempted to obtain the volume or to get a sight of Bouché's paper, nor had Meyen an opportunity of personally inspecting the disease. I have now, however, before me a Hyacinth which is evidently affected with a modification of the disease, but in too early a stage and imperfect a form to afford any additional information. The disease in an aggravated form is indicated by crumpled, deformed, yellow-striped leaves, which never attain their full development, and gradually communicate their unhealthy condition to the bulb, which eventually perishes. Nothing is said in Meyen's short report as to the condition of the roots or base of the bulb, nor indeed in what manner the plant is affected so as to induce death; the probability, however, is that the original fault was in the reduced stem, for in the majority of instances where death ensues in bulbous plants after the leaves and flowers have made a certain degree of progress, the fault has been originally more deeply seated; and either no roots, or only a few weak ones, and these confined to some isolated part of the plant, have been produced. Should any thing occur worthy of notice in the plant which I have now under observation, I shall have some future opportunity of recording it; but as the disease is evidently present in a very modified form, and the patches which are deficient in chlorophyll are assuming a reddish tint, as if there were a tendency to isolation from those parts which are still in a healthy state, a curative process seems to be going on, and the bulb may ultimately recover. *M. J. B.*

* The last paragraph of No. 299 is too broadly stated. Icterus is only a synonym of chlorosis, so far as icterus albus is concerned. Icterus used without any specific name implies jaundice.

ON THE EFFECTS PRODUCED BY THE FROSTS OF FEBRUARY, 1855, IN THE ROYAL DUBLIN SOCIETY'S GARDEN, GLASNEVIN.

BEING A PAPER READ BY D. MOORE, ESQ., AT THE EVENING MEETING OF THE ROYAL DUBLIN SOCIETY, ON FRIDAY, MARCH 30, 1855.

(*Concluded from p. 261.*)

I shall now detail the principal casualties which have happened, in so far as they are yet observable. During the time the intense coldness prevailed, the wind was mostly from the north-east, which has injured plants more on the side exposed to its influence than on that which is partially sheltered, and the appearance many of them now present is as if they had been subjected for a time to the influence of a flame of fire. The evergreen shrubs, which are usually covered with beautiful foliage at this period of the year, and some even in flower, are brown and scorched, where not completely killed; besides, the number of losses which will yet take place among them can hardly be estimated until after the active-growing season commences, that being the most trying period, when every organ is required to perform the function it is destined for. The following data must, therefore, be considered only the principal results as they have appeared up to the present time, and I shall notice them *seriatim*, as they occur in their natural orders, stating the countries they are natives of:—

Ranunculaceæ.—Pæonia Moutan (native of China), young wood very much injured, so that no flowers will be produced this year; Clematis Nepalensis (native of Nepal), young wood killed; Clematis (two species from the Himalayas), not yet named, a good deal injured.

Magnoliaceæ.—Magnolia grandiflora (Carolina), young shoots and leaves very much injured; M. auriculata (Carolina and Florida), much injured.

Anonaceæ.—Asimina triloba (western states of America), injured.

Berberaceæ.—Berberis Fortuni (China), killed to the ground. Several of the Asiatic species, which generally retain their foliage during our ordinary winters, have had the leaves killed, and in some the young shoots. Berberis Darwini (South America), scarcely touched; Mahonia fascicularis (California), lost all its leaves; M. aquifolium (Nootka Sound), leaves injured much.

Cistaceæ.—Cistus ladaniferus (Spain and Portugal), killed; C. laurifolius (France and Spain), much injured.

Pittosporeæ.—Pittosporum Tobira (China), fine, large

plant, which had stood quite hardy during the last 20 years, very much injured; P. revolutum (New Holland), injured greatly.

Malvaceæ.—Sida vitifolia (Peru), killed.

Coriariaceæ.—Coriaria myrtifolia (south of Europe), much injured.

Celastraceæ.—Euonymus Hamiltonianus (Nepal), young wood killed; E. japonicus (Japan), in some instances killed, and in others very much injured. The variegated variety has suffered equally.

Rhamnaceæ.—Paliurus aculeatus (Asia), young wood killed; Rhamnus alaternus (south of Europe), some fine large plants killed, and all the varieties much injured; R. hybridus, lost all foliage, but not otherwise injured; Colletia horrida (Chili), slightly injured; Ceanothus azureus (Mexico), fine large plants, which have stood many years, trained against walls, killed to the ground; C. divaricatus, killed to the ground; C. americanus (New Jersey), young wood killed; C. papillosus (Mexico), killed.

Aquifoliaceæ.—Ilex aquifolium, common Holly, has had leaves and young shoots killed in some instances; I. ligustrifolia, killed; I. castaneæfolia, killed; I. dipyrena (Nepal), very much injured, but not killed; I. latifolia, leaves and young shoots injured.

Homaliaceæ.—Aristotelia Macqui (Chili), large plants which have stood more than a quarter of a century killed to the ground.

Anacardiaceæ.—Duvaua dependens (Chili), large plants killed, though trained against a wall; D. ovata (Chili), very much hurt.

Leguminosæ.—Cytisus tomentosus, killed; Piptanthus Nepalensis (Nepal), some plants killed, others much injured; Ulex Europæus, common Furze, injured in some cases; Genista triquetra (Spain), young shoots killed; G. sphærocarpa and G. ætnensis have both stood uninjured; Edwardsia microphylla (New Zealand), plants which have stood many years killed to the ground; E. grandifolia (New Zealand), killed to the ground though trained against a wall; E. Macnabiana, very much injured.

Rosaceæ.—Cerasus lusitanica, Portugal Laurel, injured in some cases; C. laurocerasus, common Laurel, injured also; Rosa: many of the hybrid Roses which were budded on hardy stocks have been killed, particularly those which belonged to the tea and Chinese kinds. The common Chinese species have had their wood killed to the ground. Fortune's 5-coloured Rose, from China, has also been killed to the ground. Rosa microphylla, large plants, trained against a wall, killed; R. Banksia, fine plants, killed to the ground; Cratægus crenulata (Nepal), much injured; Photinia serrulata (China), fine large plants, ten feet high, and nearly twice as much in diameter, greatly injured, if not killed.

Philadelphaceæ.—Decumaria sarmentosa (Virginia), nearly killed.

Grossularaceæ.—Ribes speciosum (California), greatly injured.

Escalloniaceæ.—Escallonia rubra (Chili), killed as a standard, and much injured planted against a wall; E. montevidensis (South America), a fine plant of this beautiful species, which had attained to a height of ten feet as a standard, killed to the ground; E. floribunda, killed also; E. viscosa, much injured; E. Oregonensis, young wood killed; E. macrantha (Chili), leaves much browned, but the wood does not appear to be killed.

Saxifragaceæ.—Hydrangea altissima (Nepal), fine plants, which had stood out seven years trained against a wall, killed; others injured.

Araliaceæ.—Helix chrysocarpa (Nepal), very much injured.

Cornaceæ.—Benthamia fragifera (Nepal), fine plants killed to the ground.

Caprifoliaceæ.—Lonicera discolor, L. flexuosa, and L. brachypoda, all considerably injured; Leycesteria formosa (Nepal), young shoots killed; Viburnum tinus, common Laurustine, very much hurt, particularly the shining-leaved variety; the black, or hairy-leaved, not nearly so much injured; V. suspensum, killed to the ground.

Compositæ.—Baccharis halimifolia (Florida), large plants much injured; Iva frutescens (Florida), killed to the ground; Senecio cineraria (south of Europe), killed to the ground.

Ericeæ.—Great loss has been experienced among plants belonging to this order. Fine plants of Erica mediterranea, 8 feet high, and as many feet in circumference, which have probably stood during the last 30 years, have been killed to the ground. Even the Irish variety, which grows naturally in the county Mayo, is killed where it was not covered with snow. Erica arborea (south of Europe), killed to the ground; E. Australis (Spain and Portugal), killed; E. multiflora (south of France), killed, where not covered with snow; Arbutus unedo, very much injured, both in leaves and shoots—many plants killed altogether; A. hybrida, injured, but not so much as the last; A. Andrachne, young plants killed, but one fine specimen, upwards of 20 feet high, not much hurt; Gaultheria hispida, injured where not protected by snow; G. coccinea has suffered equally. Rhododendrons: hybrid varieties have, in general, suffered severely, particularly those between R. arborea and other species, some of which are killed; Azalea mollis alba (China), injured, but not killed.

Styraceæ.—Styrax officinale (south of Europe), injured, though protected by a wall.

Asparagineæ.—Bumel a tenax (Carolina), injured, but not killed.

Jasmineæ.—Ligustrum lucidum (China), one of the first plants of this species which reached Europe, killed to the ground—others much injured; L. japonicum (Japan), scarcely injured; Phillyrea media, some of the varieties injured; Olea Europæa, common Olive, injured, planted against a wall; O. excelsa, much injured, though protected by a wall.

Jasminaceæ.—Jasminum revolutum (Nepal), very much injured.

Solanaceæ.—Solanum crispum (Chiloe), fine plants, which have stood hardy during the last 10 years, much injured; S. jasmininflorum, trained against a wall, killed; Grabowskia duplicata (South Brazil), slightly injured; Fabiana imbricata (Chili), fine plants, 5 feet high, killed to the ground.

Scrophulariaceæ.—Buddlea globosa (South America), large plants, which have stood uninjured many years, killed to the ground; B. Lindleyana, greatly injured though trained against a wall; B. crispa (Nepal), very much injured.

Lauraceæ.—Laurus nobilis (Italy and Greece), fine plants, from 10 to 15 feet high, and probably 30 years old, killed to the ground.

Thymelaceæ.—Daphne pontica (Asia Minor), killed; D. Tartonraira, much injured; D. oleoides, killed; D. gnidium, killed.

Eleagnaceæ.—Elæagnus reflexus, top shoots killed.

Antidesmeæ.—Garrya elliptica (California), slightly injured.

Artocarpeæ.—Borya ligustrina (Illinois), killed.

Ulmaceæ.—Ulmus sempervirens, killed.

Corylaceæ.—Quercus virens (southern states of America), killed to the ground; Q. coccifera (Levant), much injured; Q. pseudococcifera (Algiers), fine plants, much injured; Q. Fontanesi, slightly injured; Q. suber, cork tree, fine plants, much injured.

Taxineæ.—Taxus canadensis (Columbia River), much injured; T. japonica (Japan), quite safe, and very hardy; Taxodium sempervirens (California), upper branches much injured; Cephalotaxus drupacea (Japan), not injured; C. pedunculata (Japan), not injured; C. Fortuni (north of China), safe; Podocarpus Totara (New Zealand), killed.

Coniferæ.—The plants in this order, which have been either killed or much injured, may be considered the greatest losses. Pinus Brunoniana (Nepal), young wood killed; P. religiosa (Mexico), killed; P. Webbiana (Nepal), upper branches injured; P. deodara (Nepal), foliage much browned in some plants, others not injured in the slightest degree; P. Ayacahuite (Mexico), fine plant, killed; P. Lambertiana (Mexico), young plant killed; P. monticola (Mexico), slightly injured; P. Apulcensis (Mexico), foliage injured only; P. Devoniana (Mexico), foliage injured; P. Montezumæ (Mexico), very slightly touched; P. pseudostrobus (Mexico), slightly injured; P. Russelliana (Mexico), foliage greatly injured; P. muricata (Mexico), slightly injured; P. patula (Mexico), foliage much injured; P. Hartwegi (Mexico), one fine plant killed and another a good deal injured; P. palustris (North America), much injured; P. jezoensis (China), killed; Araucaria imbricata (Andes), leaves of some plants a good deal browned, others not injured.

Cupressineæ.—Thuja pendula (China), young shoots injured; Libocedrus Chilensis (Chili), slightly injured only; Cupressus funebris (Chinese Tartary), one fine plant killed, and another killed where not protected by snow; C. Goveniana (California), tops of branches killed; C. thurifera (Mexico), fine plants killed (?); C. Coulteri (Mexico), one fine plant killed (?), and another very much injured; C. Uhdeana (Mexico), injured at points of shoots; C. elegans, or Mexicana (Mexico), much injured; C. lusitanica (Cedar of Goa), some fine plants killed, others much injured.

Juniperineæ.—Juniperus Bermudiana (Bermudas), killed; J. flaccida (Mexico), killed; J. tetragona (Mexico), much injured; J. gossainthanea (Himalayas), much injured; J. Bedfordiana, much injured.

Smilaceæ.—Smilax maculata (Nepal), injured, though planted against a wall; S. aspera (Asia Minor), much injured; S. sarsaparilla (America), injured; S. latifolia (New Holland), injured, but not killed.

Liliaceæ.—Ruscus racemosus (Portugal), branches injured.

Asphodeleæ.—Phormium tenax (New Zealand Flax), much injured, but not killed.

Gramineæ.—Gynerium argenteum (Pampas Grass), foliage killed, as well as some of the plants, and all the others very much injured.

In addition to the foregoing, many fine specimens of New Holland Acacias, and other plants from the southern hemisphere, which had stood out several years, trained against walls, with only slight protection, have all been killed to the ground, including the blue passion-flower (Passiflora cærulea), besides many small rare plants which were growing in the narrow borders fronting the conservatories, have also been killed or much injured.

This long list of casualties will at once show that the commonly received doctrine of plants becoming acclimated rests on a very unstable foundation. The individual plants which are first imported never become hardier, but rather the reverse; but seedlings obtained from them may and do so.

The extreme cold has, however, had its advantages by showing us the plants which are really hardy and never likely to be injured in Ireland. I shall, therefore state the names of a few, which may be reckoned valuable, and well worthy of being planted where rare ornamental trees are desirable, viz.:—

Pinus nobilis, P. ponderosa, P. Sabiniana, P. Coulteri, P. californica, which closely resembles C. Coulteri; P. Benthamiana, P. muricata, P. insignis, P. Pinsapo, P. cephalonica, which is often hurt by late spring frosts, but otherwise very hardy; P. Montezumæ, P. excelsa, P. osteosperma, P. Nordmanniana, very fine; P. Gerardiana, P. cembröides, P. Douglasi, where the soil is not much mixed with the debris of limestone; Taxus japonica or Makoyi, Cephalotaxus pedunculata, C. Fortuni, Cupressus Lambertiana, very fine; C. Tourneforti, C. Goveniana, C. torulosa, very fine; Juniperus excelsa, fine; J. recurvata, J. Chinensis, and I. oxycedrus.

Dr. Mackay said he, too, had losses to deplore, which had occurred in the College garden. Plants which had stood more than 30 years had been either much injured or killed this year; but he specially regretted the loss of a fine plant of Pinus macrophylla, which was nearly 6 feet high and beautifully furnished.

CONSUMPTION OF FUEL IN HEATING THE KEW PALM-HOUSE.

In your columns of 30th December and 27th January last, Mr. John Weeks and Co. advertised a boiler for heating hot-houses, and in order to convince the public of its extraordinary heating power and economy in fuel and labour, they gave a statement showing that if their boilers were to be employed for heating the Kew Palm-house, an annual saving of 1095*l.* would be effected upon fuel and labour connected therewith. In your paper of the 10th February Sir William Hooker contradicted the above statement, showing that the average cost of fuel for the Palm-house was not more than 300*l.* a year. Messrs. Weeks replied to this by doubting the correctness of Sir William Hooker's statement; they did not then, however, give a downright denial of its truth, but in a weekly periodical called the "Cottage Gardener," for April 10th, there appeared an article on the subject signed "John Weeks and Co.," which concludes with the following paragraph:—"We would observe that we are not at all surprised that many of your readers, including 'W. X. W.,' should be astonished at the very contradictory statements which appeared in the 'Cottage Gardener' and other papers from Sir William Hooker and the Messrs. Weeks, relative to the consumption of fuel to heat the Kew Palm-house; but as Sir William has chosen to observe a strict silence on the subject since our reply to his first statement, neither your readers nor ourselves have any other alternative but to fall back on our own judgment; and as practical men of some 36 years' experience, we have no doubt whatever that it is perfectly impossible to work the 12 boilers now in use at the Kew Palm-house and maintain a temperature of 60° for anything like 300*l.* a-year; and that, therefore, some great mistake must have been made by those who gave in such a report of the expenditure to Sir William Hooker." From this it would appear that Messrs. Weeks expected Sir W. Hooker to have given some further statement; but as he could not alter the truth, viz, that the cost of fuel for the Palm-house did not average more than 300*l.* a-year, I therefore do not see what further notice of the subject could be expected, especially seeing that the public position held by Sir William Hooker is a sufficient guarantee that his statement is correct. The paragraph above quoted concludes by saying that "some great mistake must have been made by those who gave in such a report." Now I confess it was I that made the report in question by desire of Sir William Hooker (the whole of the ordering and payments for fuel being checked by me), and in order to show Messrs. Weeks the data by which I arrived at the cost of fuel for the Palm-house, I will here give a detailed account of the sums paid for fuel for the use of the Royal Botanic Garden during each of the following years:—

Year ended 31st March,	1846	...	... £388	10	6
" "	1847	...	... 400	0	2
" "	1848	...	... 507	7	6
" "	1849	...	... 761	9	6
" "	1850	...	... 794	6	6
" "	1851	...	... 817	8	6
" "	1852	...	... 673	1	3
" "	1853	...	... 723	8	9
" "	1854	...	... 769	0	0

No exact separate account of the cost of fuel for the Palm-house has been kept, therefore in order to ascertain that point I took the average cost of the whole garden before and after the Palm-house fires came into operation; the latter took place in June, 1848, and the first payment for fuel on account of the Palm-house is included in the sum of 761*l.* 9*s.* 6*d.*, shown to have been paid in March, 1849, consequently the above table includes six years of the Palm-house (less April, May, and part of June, 1848), the average of these six years for the whole garden is, in round numbers, 756*l.*; and after substracting the average of the sums paid in 1846 and 1847 (394*l.*) there remains 362*l.*, which would be entirely due to the Palm-house, provided there had not been, as Sir William Hooker justly states, many other additional fires in operation during those six years, the cost of which I cannot set down at less than 60*l.*, thus bringing the cost of fuel for the Palm-house to about 300*l.*, which with the wages of stokers amounts to 423*l.* per annum. It will be observed that I have left out in the above computation the sum paid in the year 1848; if I had taken that into account the average cost of the Palm-house would have been less, but it would not have been a just statement, as a portion of the fuel for that year was used for a purpose not before or since required. Now, if Messrs. Weeks, with their "practical experience of some 36 years," will still maintain that a great error has been committed in making

the above calculation, and also that their boilers would have saved 1095*l.* a-year during these six years, then I must say that their practical experience has availed them but little in forming a correct judgment in this instance. I have not the means of proving to Messrs. Weeks the correctness of the above statement otherwise than by entries of payments, and coal merchants' tickets of deliveries; but if what I have shown is not sufficient to convince them of their error, it may be possible for them, on making a proper official application at the office of the Commissioners of her Majesty's Royal Parks, Palaces, and Public Buildings, in Whitehall Place, to be allowed to see the whole of the receipted bills; or a more ready way would be to see the official printed estimates for this garden, which are laid annually before Parliament, for in these estimates Messrs. Weeks will find the sum set down for fuel for the year ended March, 1849, to be for the Palm-house 360*l.*, and for the rest of the garden 400*l.*; in the following five years both services are united in one sum, viz., 800*l.* The expenditure above given, when compared with the estimates of the corresponding years, shows that our first and original estimate for the Palm house has not been exceeded during the six years.

It is to be regretted that Messrs. Weeks should, after their "36 years' practical experience," have made such a statement: for it is to the family of Weeks that horticulturists are indebted for many early improvements in heating by hot-water;—I say early, but I also hope recent, especially in regard to the boiler they have advertised. I have no doubt but that it has merits above its predecessors, and if so it will soon become known and appreciated by the public, even without the extraordinary statement of its power and economy as given in the advertisement. Such statements are often apt to make the cautious public think that they are too good to be true; nevertheless I will venture to assure Messrs. Weeks that if occasion arises for boilers in this garden, the merits of their new boiler will be fully inquired into; but I candidly tell them that the experience I have had of boilers has made me very incredulous as to the economy of this or that boiler, both as regards the consumption of fuel and in not requiring to be looked at for 12 or 16 hours! Most boilers come up to the mark on these two points during the summer half-year, but in the winter half they fall much below par. Another point Messrs. Weeks take credit for, is in having the whole of the houses of their nursery heated by one boiler. I intended to have given my reasons for differing from them on this point, but as the subject has been fully entered into by Mr. Ayres in the *Chronicle* of last Saturday, I therefore do not deem it necessary to do so; his views entirely coincide with my own, and I can bear testimony to the consequences of the alarming words—"Please, sir, the boiler has burst," or I had it often, "The boiler of Number— is leaking, and has put out the fire." There is another paragraph in Messrs. Weeks' article in the "Cottage Gardener" that I will briefly notice; speaking of the extent of the surface of their houses exposed to the action of cold, they say, "if we take the outside measurement of our detached houses and compare them with the Kew Palm-house, it will be found our detached houses measure about twice as much." I will ask, does this include the brick walls as well as the glass, or glass only? I must confess I am somewhat sceptical as regards the correctness of this statement, not yet having forgotten my country's proverb that "it taks mony wees to mak' a muckle." The Kew Palm-house is free to the public; any one may measure and make his own calculations—not so with Messrs. Weeks' establishment, for having a due respect to politeness, I could not think of deliberately entering their premises with measuring tape in hand without their sanction or invitation. *J. Smith, Royal Botanic Garden, Kew, April 23.*

MONSTROUS SWEET WILLIAM.

A few weeks since you published some remarks on a singular state of the common Foxglove, in which the calyx leaves were multiplied at the expense of the inner whorls of the flower, while in a few cases only anything was produced in the shape of carpels. It was shown that parietal and axile placentation occurred in the same capsule, while the axis was prolonged beyond the placentæ and bore at its apex a second whorl of carpellary leaves within the first. I have lately had an opportunity of examining a state of the common Sweet William in an exactly similar condition. Unhappily, from the advanced season of the year, a very few only of the ovaries which had been developed were in a fit condition to yield any certain information; but notwithstanding this inconvenience, results have been obtained which seem of sufficient importance to lay before your readers.

Exactly as in the Foxglove, in advanced ovaries, there was not only the ordinary column studded with ovules arranged evidently on three confluent placentæ, the tips or stigmatic cords of which were free and naked, but the axis was crowned by one or more whorls of carpellary leaves, either so confluent as to form a distinct capsule, or perfectly free to the very base, and exhibiting one or sometimes two ovules attached by peduncles to the edge. A single flower was obtained a few days later, in which the petals though small were tolerably developed and perfectly fresh, as also were the ovary and stigmas. The carpellary leaves of this were disunited above, and only two in number, with the addition of the rudiments of a third, indicated chiefly, as in the Foxglove above mentioned, by an additional style. This ovary proved extremely interesting. In a transverse section half way up, the placentæ were seen springing evidently from the walls, but perfectly united in the centre, and showing a fascicle of vessels marking the position of the axis with which they were confluent. A gentle motion of the dissecting knife easily separated one of the placentæ from the walls, as did the mere act of drying; but the other was so firmly incorporated that it could not be separated without actual violence. There was in fact no real solution of continuity. A section higher up exhibited the placentæ as perfectly marginal without the slightest tendency to meet in the centre, though the axis was prolonged and presented sections of two carpels, within which were three more, disposed spirally, and all of them terminated with a short linear style. In this case, of course, there were no free stigmatic cords.

The inference from this example is precisely the same with that which was derived from a Carnation, of which an account was formerly published (*Gard. Chron.* 1850, p. 612), that the placentation in Caryophyllaceæ is essentially marginal, and the apparently central placentation arises merely from an early solution of continuity between the placentæ and the walls on which they were originally developed. I have had many opportunities of re-examining the Carnation, for all the plants raised from the original plant exhibit the same peculiarity of producing a number of ovules transformed into carpellary leaves, and I had the pleasure during the present autumn of showing growing specimens to Dr. Hooker and Dr. Thomson. I do not deny altogether the possibility of central placentation, but it is very probable that many of the supposed cases will be resolved into parietal.

In the Foxglove the two confluent carpellary leaves, of which you gave a figure, produced a placenta on the line of juncture; but in the present case the placenta was confined to the outer margin of each as exhibited in the woodcut. One figure represents two fertile placentæ with their stigmatic cords. In the one the axis is terminated by three central, in the other by four

oblique and very irregular carpellary leaves. Both of these ovaries were more or less decayed. The left-hand figure presents a single carpel of the second, with a distorted ovule near the base. The two right-hand figures represent the sections described above, of which the upper is the more highly magnified; and the remaining figure shows two confluent carpellary leaves, with an ovule at the outer edge, situated just at the point where the suture with the other carpellary leaf ceases. *M. J. B.*

TREE MIGNONETTE.

Common Mignonette is so well known that it is superfluous to say a word about it. It is to the culture of it as standards for the winter decoration of the conservatory and greenhouse that I would now direct attention.

I generally sow in 4-inch pots, about the end of March or beginning of April, according to the number of standards required. The soil I use is maiden loam and leaf-mould in equal quantities, with a little well rotted manure and sand added. I drain and fill the pots in the usual way, but do not press the soil too firmly; I smooth the surface, and put a pinch of seed in the centre of each pot. I cover thinly with fine sifted soil; water gently; and remove the pots to the stove, or, if that is not available, to a hot-bed, and the plants soon make their appearance. As soon as they have grown a little, I pull all out but three of the strongest near the centre of the pot. After all danger of their damping off has in a great measure passed, I remove the two weakest, and tie the other to a neat stake. I repot as the plants require it, and remove the lateral buds as soon as they make their appearance in the axils of the leaves, at the same time preserving the leaves on the stem carefully. The flower will soon make its appearance on the top of the stem; I remove it at once, and allow the highest lateral bud to grow to form the next leader to be tied to the stake as soon as possible; I remove the lateral buds as before, and so on till the stem is the desired height.

When the stem is of the height required, I cut off the top, and allow four or five of the highest lateral buds to grow. As soon as they have pushed a little I pinch them, leaving only two buds on each; I allow them to start a little, and then remove the plants to a cool greenhouse, where they get plenty of air; I continue to pinch regularly as the plants grow, till the heads are the desired size (which will be about the end of September or the middle of October), when they will require their final shift, using 8 or 9-inch pots according to the size of the plants. I procure some iron wire for supports, or neat wooden stakes. After being inserted into the pots they must stand 2 or 3 inches above the head of the plant, to allow all the laterals forming the head to be suspended from them with small pieces of bast. If they are not tied up carefully they will, as they grow, droop down and break, as Mignonette is a plant of straggling habit.

Treated in the above way, Mignonette will flower freely till the time when there is plenty to be had out of doors, when the plants may be thrown away. I prefer growing from seed every season. The little extra trouble required is amply compensated by the neat compact form of the heads of the young plants.

Amateurs will soon find that there is a great difference in the habit of individual plants of Mignonette when growing for standards. Some of the heads will assume a neat compact form, with fine broad foliage, while others will be of an opposite character. Seed should be saved from the plants having the best habit for next season's growth.

I have little doubt that the common Mignonette will be superseded, so far as the growth of standards is concerned, by the new variety, named grandiflora. It appears to be a very robust grower, with fine broad foliage, and will consequently require less time in forming a standard. *Alpha.*

SIR W. J. HOOKER'S REPORT ON KEW GARDENS.

Royal Gardens, Kew, 31st December, 1854.

In presenting my Report on the Royal Gardens of Kew for the year now closed, I need not dwell much on the Botanic Garden as distinguished from the Pleasure Ground or Arboretum. Its progress has been detailed in former Reports. The arrangement of walks, lawns, clumps, and ornamental flower beds is, so far as regards general features, complete.

In novelties, rarities, and especially in useful plants, we have received as many additions as in any former year, and equally numerous have been our donations to foreign gardens and colonies. The former circumstance (our augmented collections), when taken in conjunction with the constantly increasing growth of the plants, compels me to entreat for more accommodation to our greenhouse plants from temperate climates, and especially those of a large size, such as scarce tender Pines, and Australian trees and shrubs.

Nothing has occurred to lessen the number of visitors, or the interest shown by the public in the Gardens and Collections. As in former years, I submit a statement of the number of visitors annually, commencing with the first year of admission to the Gardens, viz. 1841, 9174; 1842, 11,400; 1843, 13,492; 1844, 16,114; 1845, 28,139; 1846, 46,578; 1847, 64,282; 1848, 91,7[illegible]; 1849, 137,865; 1850, 179,627; 1851 (the year of the Great Exhibition), 327,900; 1852, 231,210; 1853, 331,210; 1854, 339,164.

It will thus be perceived that the numbers are steadily and constantly increasing. The great superiority in the year 1851 must be considered due to the influx of people to the metropolis caused by the Great Exhibition, and that of 1853 to the Sunday admission. In the same proportion has increased the number of individuals who come for study and instruction, especially artists. To various Government Schools of Art and Design we continually send abundant supplies for the use of their pupils in London.

The Pleasure Ground adjacent to the Garden, and occupied during the last four years as an arboretum, devoted to all kinds of foreign trees and shrubs that will bear our climate, while still keeping up its ornamental character, has its growing attractions. The rough ground, bordering on the grand walk, or Sion Vista, has, during 1854, been levelled and formed into lawn, and the planting is finished; and a large proportion of the trees and shrubs have been named, in conspicuous letters on iron tablets, with the genus and species in Latin and English, the name of the author who first described it, and the native country; thus rendering this collection of hardy trees and shrubs immediately available for the instruction of nurserymen, planters, &c.

The Museum of Practical or Economic Botany has prospered, and is a source of usefulness as well as gratification to our merchants and commercial men, as well as to scientific persons. Not a day passes but applicants come for information about the woods, oils, fibres, gums, resins, drugs, and dye-stuffs, of which the stores and greenhouses contain the living sources, and the Museum the products, all authentically named.

A new feature in connexion with the Royal Gardens remains to be noticed.

In all continental and Government botanic gardens it is considered indispensable that an Herbarium and Botanical Library should be appended to them, for the benefit not only of the garden itself, but of students and of all who desire information on the properties and commercial value, and on the correct names of the plants which are employed in trade, in the arts, in medicine, manufactures, and domestic economy, &c., &c. The largest garden can never be sufficiently spacious to contain all the known serviceable plants in a living state, even if they could be procured. But a well-preserved herbarium does, or should, contain dried flowering species of every known plant in the world. Again, in the Library we have figures and descriptions, and historical notices of all plants ready for daily consultation. Thus an Herbarium and Library are essentially part and parcel of a Botanic Garden, and when combined with a Museum leave nothing to be desired.

Till 1853 our Garden was utterly destitute of the two former appendages. During that year and the one now expired it has been my duty to report the presentation of two valuable Libraries and Herbaria. One was the gift of Miss Bromfield: it had belonged to her deceased brother, Dr. Bromfield, of the Isle of Wight; the other was bestowed on us by George Bentham, Esq., of London. Both were presented under condition that they should be available, under proper restrictions, for the public service, and both are safely deposited at Kew.

These presents, together with the entire private herbarium and library, the property of the director, have been made available for public use, and are accommodated and conveniently arranged within the precincts of the Garden. This important arrangement was effected in the early part of the year now ended. The benefits of it have already been experienced by botanists, students, and persons of all grades who desire information about economic and other plants throughout Europe. Many have come to reside at Kew for months at a time, with the sole purpose of study in the herbarium, library, and museum, and among the living plants in the Gardens.

I must mention among the more important contributions to the library during 1854, a splendid collection of drawings, upwards of 1000, given by Miss Cathcart, which had been made in India under the direction of her late brother, Major Cathcart; a set of 2188 drawings of Kew plants, which had been prepared by the order of the late William Townshend Alton, Esq., presented by William Attwell Smith, Esq.; and the entire botanical correspondence of the late Dr. Wallick, during his 28 years superintendence of the Gardens at Calcutta, which that gentleman bequeathed to the Gardens.

Lastly, the country appreciates and acknowledges the service it has received from this establishment: the visitors of all grades (on two occasions exceeding 10,000 a day) evince by their general good conduct their thorough enjoyment of the place. Merchants, manufacturers, travellers, we may even include foreign potentates, testify to the same by their gifts of all kinds of plants, museum objects, and books to the library.

To our own colonies our books show that we have contributed extensively, by the dispersion of useful plants and seeds to climates suited to their growth, wherever our trade and commerce reach. *Parliamentary Paper* 140, 1.

COMMON THINGS.

Neapolitan Violets.—About this time collect a quantity of stones about an inch in circumference, and look over your frame, laying one stone on each runner about an inch from its end; after that mix a barrowful of loam and leaf-mould in equal parts, and with a coarse sieve shake it lightly over them an inch thick, afterwards giving them a gentle watering. The lights may be put on every night, only exposing them in fine days, and during mild showers. The last week in May take the runners up with a ball, and prepare a piece of ground on a north border, with the same soil as used in the frame, viz., equal parts of yellow loam, leaf-mould, well-decayed cow-dung, river sand, and old lime rubbish. Plant them in rows 8 inches apart each way, watering them in dry weather; about the beginning of September prepare your frame in which Primulas or any thing of that kind have been grown during the summer months, by placing at the bottom a layer of bricks, on which coal ashes should be spread within 18 inches of the top. Then fill up within 5 or 6 inches of the glass, with a fresh supply of the above compost, slightly pressed with a rake. After taking up the plants carefully but not with too large a ball, plant them in rows as above, giving them a good watering, and shading them from the hot sun for about a fortnight with garden mats, putting the lights on at night. A good thickness of short dung should be applied round the outside of the frame, to keep out the frost, which must never be allowed to get to the plants. A few with good balls may be taken up even when in full flower large enough to fill an 8-inch pot, to stand in the drawing-room. By acting on the above plan a continual supply of this favourite flower may be had from November till March.

The Camellia may be propagated by cuttings, but the usual nursery practice is to graft or inarch on stocks of the single red and Middlemiss red varieties. Cuttings of these root freely, provided they are taken off in a properly ripened state. After being prepared, and potted in very sandy soil and watered, they should be placed in a cold frame till cicatrised, and then introduced into gentle bottom-heat, where they will soon form roots.

Home Correspondence.

Extraordinary Hail-storm.—Mr. Darwin (Researches, p. 435), gives an account of the destruction caused to deer, ostriches, and other wild animals by a hail-storm in the Pampas, of which he was not indeed himself a witness, but of which he saw the results and was satisfied that the account he received from those who were eye-witnesses was substantially correct, and the more so, inasmuch as a similar account is given by Dobrizhoffer in his History of the Abipores. The hail-storm of which an account has just been received from a young officer stationed at Secunderabad, in a letter dated March 13, is still more striking, and is well worthy of being recorded:—"Vegetation is very abundant here, and consists of large tropical plants and all sorts of small weeds. The jungles are very fine. I believe that there are plenty of fungi in the rainy weather, but there is nothing of the kind now. We have had some heavy storms lately, and during one several natives were killed at Bolarum by the hailstones. The brigadier who was out, calling at Bolarum, had the panels of his carriage knocked in; every pane of glass in my house was broken, and some hailstones came into my room, 5 inches long and of the shape of an egg. About a mile from Secunderabad the hail was so heavy that it stripped all the bark off the trees, and has left a road of broken trees through the jungle. I had a quantity of the ice collected, and it lasted three days. A native on the day of the storm, who saw me eating a piece of ice, asked whether it was good, and immediately took up a mass as large as a pigeon's egg and tried to swallow it whole, but it stuck in his throat and he was very nearly dying, but luckily it was removed in time to save him from suffocation. The people were much astonished, having never seen any ice before, and one of them came up to me with his hands full, shivering and bellowing out, 'Bahot tunda, bahot tunda, sahib,' (very cold, very cold, sir)." *M. J. B.*

The Osage Orange.—The following information respecting this plant was obtained during a short residence in the United States. The Maclura or Bow-wood, as it is more commonly called in America, is a native of Arkansas and Missouri, where it is arborescent, and grows from 50 to 70 feet high, and is considered one of the handsomest trees indigenous to that country. The leaf is ovate-lanceolate, and of a dark glossy green. The shoots are furnished with thorns scarcely less formidable than those of the Gleditschia. The fruit is large, round, and of a golden yellow. The wood when properly seasoned is of great durability, and in the southern states is extensively used for ship-building in preference to the live Oak or Quercus virens, which abounds in America, and forms in the south and far west the main material in the form of timber used for that purpose. Various articles of furniture are also made of the Bow-wood, such as chairs, tables, drawers, bedsteads, &c., and from the shavings, chips, and other refuse, a yellow dye is made. Passing from the south and west to the northern and eastern states, the Maclura becomes a mere bush, and is useful only as a hedge plant; but its value for that purpose is, and must be wherever it will grow, truly great. A hedge properly made of it does, indeed, bid a "sweet defiance" to man or animal. Nothing can pass through it, and to climb over it would be next to impossible. Nature has given it the faculty of being made into an impassable barrier, which, when skilfully and properly made, must from the very formidable nature of the plant, give strength and durability ten or twenty times greater than could be offered by any ordinary Whitethorn or Quickset hedge. But, will it grow—will it succeed in this country? That's the question. I answer—No doubt about it. I have seen it in various parts of the States, and under various circumstances, and I do not hesitate to state that it will not only grow and thrive here, and make a hedge or means of defence far stronger and more secure than anything we now have; but for months after your Whitethorn hedge has been leafless and barren, the Bow-wood will be clothed with its beautiful dark green foliage up to the latest period of the year, which I look upon as a point by no means to be overlooked. For railway companies the Maclura will be of great value, more particularly for the summit of railway embankments. Its roots being very fibrous and having quite an horizontal tendency, they will greatly assist in keeping up the soil, and thus be a means of preventing land slips, which often occur. In another number I will say something of the culture of the Osage Orange. I would inform those who desire to know more of this plant, that I have brought over with me some of the shoots of last year. They may be seen at 21, Regent Street, at the Meeting of May 8th. *A Gardener.*

Effect of Gas-lime, Sand, and Ashes on Lawns.—At the recommendation of one of my neighbours I have applied to my lawn lime from the gas-works mixed with equal quantities of sand and ashes from the kitchen grate. From this application I was led to expect a beautifully firm and green surface; but to my astonishment the Grass is literally burnt up, and I fear completely ruined. Pray what is best to be done with it? *J. W. L., Manchester.* [Let it alone. It may recover when rains and S.W. winds return. If not you must replace it.]

Bedding Plants for a Long Border.—Having a long straight border, about 12 feet wide, which I purpose planting this season with flowering plants in continuous rows, but in such a manner as to produce the best effect, I should feel obliged for the opinion of some of your readers, who have been in the habit of planting such borders, as to what plants are most suitable for it. I may observe that at present it is perfectly clear, its front is margined by a broad walk forming an important feature in the place, while a low Laurel hedge runs along the back. I should not like anything higher than 3 feet, and I do not wish more than six or seven rows of plants. Now what are these rows to be composed of? I am tolerably well off for the bedding-out plants most common in use, such as Geraniums, Calceolarias, Salvias, Fuchsias, &c., but I want to know how to dispose of them to the best advantage; the effect to be produced being for the present season only. *N. W.*

Percepier.—"At Cainsham, on the west bank of the river Avon, about 5 miles above Bristol, grows wild the plant Percepier, peculiar to England. It has a strong bitter and sharp taste, and never exceeds a span in the whole year, having no stalk but herbaceous flowers. It is a powerful and quick diuretic, and water distilled from it is useful in many cases."—*Camden's Britannia.* In a foot-note it is said, "Mr. Ray says it is not uncommon in foreign countries. Hist. Plant. IV. 14. Nor is it uncommon in England." Would you have the goodness to look into Ray, and see what is meant by Percepier, and let us know what is the real name of this strange plant. *A. F.* [The plant is Aphanes (or Alchemilla) arvensis, a common weed in gravelly places, and commonly called Parsley Peart, a corruption we suppose of Percepierre.]

Gas from Green Wood.—Can any of your correspondents (scientific men) inform me what that gas is which escapes from green wood freshly put on the fire. It may easily be perceived if prevented from escaping up the chimney by a side draught or cross current of air, and it is unaccompanied by smoke. It is peculiar, but not disagreeable. It comes abundantly from green Apple wood, but is not, I think, peculiar to that. *X. Q. Q., Leysters.*

Fruit and Potatoes uninjured by Frost (see p. 262).—The cistern in your correspondent's fruit-room doubtless first attracted the frost, and therefore his fruit and Potatoes escaped injury. Our father for many years adopted the practice of placing pails, basins, or dishes of water in his fruit-room during intense frosts, thus preventing his fruit from being frozen whilst the vessels contained water, which always attracted the frost before anything else in the room; when all the water had become ice, of course it was necessary to replenish it. Of late years we have been more successful by introducing something larger, such as wash-tubs or milk-pans, filled with water, in the most draughty part of our fruit-room. No doubt, therefore, tubs of water placed in greenhouses, and probably under or near wall fruit trees, would prove useful. If frozen Apples or Potatoes before they are thawed are put into cold water for a few minutes it will extract the ice from them to a degree remarkable, inasmuch as they may be taken out, all sticking together, a complete mass of ice, and if they are then thawed slowly in the water, and afterwards dried, most of them will be as good as ever. Doubtless frozen plants might sometimes be saved by the same practice. The middle of a room is the safest place for preserving fruit, &c., from frost, the sides being the most draughty and cold. We had Potatoes this winter slightly covered with a cloth in the middle of an out-house, opposite the outward doorway, uninjured; whilst others, coddled and covered with great care at the corners and sides, were much frozen, although adjoining other warm apartments. Sometimes in a walled garden it is colder on the borders under the walls than in the middle quarters. Some greened Potatoes exposed in the middle of our grounds all winter, where all the snow had blown off, are now perfectly sound, springing most vigorously, whilst others, buried a foot under ground, are destroyed. *Hardy & Son, Maldon.*

Nursery Treatment of Young Conifers.—I wish to call the attention both of nurserymen and amateurs to the very careless and injurious manner of growing Pines which prevails in so many nurseries. They are carefully tended for a year or two, and then too often are left in pots of ridiculously small size till somebody chances to buy them. The consequence is, that the roots are to the plant what a child's limbs would be to a man's body; they twist themselves round and round till all healthy circulation is checked, and when planted out they are unable to take firm hold of the ground, to avail themselves of its nutritive qualities, or to resist violent winds. Such plants often grow for a few years till a gale of wind comes and blows them over, when it will be generally found that the roots are rotten from impeded circulation. Of course no one who understands these things would choose such plants from a nursery; but when living at a distance from any good establishment of the kind, a gentleman sends his order by post, it is so vexatious to have to return the plants, or be content with one's bad bargain, and by careful untwisting of the roots, and a few years' attention, to endeavour to undo the mischief which, but for neglect, could never have arisen. The very general admiration for Coniferæ which now prevails amongst English amateurs will show how important this subject is; and I greatly fear that in many at present healthy-looking Pinetums this source of evil will be, a few years hence, abundantly felt and lamented. Why if the Scotch and Spruce and Larch and Oak that we buy for our plantations were grown in this manner, what would be the result? Yet the victims of this system of mismanagement are those very plants which we are looking to as the chief ornaments of our pleasure grounds and woods! I wish that every Pine grower would devote his attention to this point; and by way of putting an end to so great an evil, I would propose that there should be published in your journal the names of all those nurserymen who send out plants in this wretched "pot-bound" state, and the names of those whose plants are healthy, well-rooted, and in a creditable state. Were this plan adopted, one would always know who were the right men to go to in whatever district one chanced to be. It has been my fate to form acquaintance with several nurserymen of the southern and midland districts, and I could tell you pretty well who send out properly-rooted Pines, &c., and who do not; I have now come to reside in a district where nurserymen are scarce, and good ones almost unknown, and I am sorry to say I could now give you the names of two or three whose plants are a perfect disgrace to them, and I am, therefore, obliged to send to the south, or to the neighbourhood of London, in order to procure plants that I can be sure will be sent in such a state as to give me a hope that my Pinetum will prosper. If I could draw, I would give you a picture of a Pinaster supplied by Messrs. —— of —— which would amusingly illustrate what I have said, 4 feet high in a 3-inch pot! But enough. *Pinetum.*

Gooseberry Caterpillar.—The following facts may, perhaps, not be without interest. Gooseberry caterpillars have been in past years particularly destructive here; last year they were very numerous, and although various methods were tried for their extirpation, they were of little avail. This year I determined to stop their ravages if practicable, and so far, I am happy to say, I have been successful. Knowing that the chrysalis is deposited in the ground—where it remains during the winter—and that the first few warm days in spring cause the fly to emerge, I kept watch to note their first appearance, and by employing an hour or two in the morning for a few days, I caught several hundreds of flies. Each of the females, at a rough average, I calculate contained fifty eggs—probably many more. On examining the Gooseberry leaves now I find but very few eggs deposited, consequently they are easily removed. I am persuaded that the above method is the easiest and surest way of getting rid of the ravages of this voracious grub. The following description of the fly may be of use in identifying it:—Wings four, quite transparent; the head and antennæ black, the thorax yellow, with a large black spot above and below, the upper spot generally divided into three; the body is of a delicate yellow colour; the legs yellow, and the feet black. *Robert Grey, Hadzor Gardens, Droitwich.*

Natural Mushrooms in April.—I beg to send you a basket of Mushrooms gathered from an exposed Asparagus bed, and a sample of Mushrooms from a Mushroom-house. A circumstance so unusual as a crop of Mushrooms out of doors at so early a period in the year exposed to the opposing influences of severe night frost and dry dewless weather, appears to me to be sufficiently singular to merit remark; the superior excellence of the natural Mushrooms will be evident by comparison. By way of explaining the appearance of the Mushrooms on an Asparagus bed, I may state that having occasion to form a new Asparagus quarter last year, and the natural soil being clay, I was obliged to make the beds of materials borrowed from various places. A layer of the leaves and dung from my Seakale quarter formed the bottom, the top Grassy sods of a pasture, followed by a quantity

of drift, anciently deposited by a little river adjacent the place; the upper part was mixed with the short dung from an exhausted Mushroom bed. The whole was well salted, the bed was raised about 2½ feet above the surface, and the Asparagus planted. During the summer, and until late in the autumn, the Asparagus was pretty nearly pushed out of the ground by immense clusters of Mushrooms. I regret not keeping an account of the number of bushels gathered. No protection was given to the Asparagus bed during the winter, and I concluded that frost and snow, and other climatic influences, had ended my trouble with Mushrooms, but they have appeared again as vigorously healthful as ever. I think this chance has conveyed a lesson in Mushroom culture, and instead of the usual and annual construction of beds formed of horse-droppings and crusts of soil, why should we not form a permanent bed to last several years, and afford a perennial supply of what M. Soyer calls the Pearl of the Fields? *W. Ingram, Belvoir Castle, April* 26. [The specimens were very fine in all respects, and completely answered to Mr. Ingram's description.]

Foreign Correspondence.

Guatemala, *Dec.* 1854.—You have enclosed a few seeds of the Scarlet Antigonum. It is a glorious creeper, and now in full bloom; but perfectly indescribable for its luxuriance. A plant eight years old has its great elephantine-like bulbs, from which springs, in this instance, a stem as thick as my arm at the elbow, some 30 feet long, turning round and round an Anona tree, and spreading over the top of the tree, some 50 feet high and 14 feet in diameter, a canopy of scarlet and green; while, not content with this, it has caught the corridor of the house, and also covered a space 20 feet long, hanging a curtain of 10 feet deep of scarlet streamers. The old lady in whose house this splendid specimen is growing has given me a couple of bulbs,(!) with their young shoots all in prime order; at this season of the year I have great hopes it will preserve its vegetating properties till it reaches England. I packed them in the identical soil where growing, in a box, along with a yellow Bejuco (probably a Galphimia), equally curious, and sent them off by this packet. These plants are natives of our coasts here, climate about 75°; but they thrive here after 6 years' acclimatation 65° to 68°, which is necessary before they flower, so do not be disappointed if the first year does not produce flowers. One thing I observed in unpotting the present specimen—at the end of the numerous fibres on the bulb were 20 or 30 small bulbs, or literally Potatoes, covered with small fibres. All these, I expect, will produce plants, and if so you will have a supply. My wish is that everything I know here as fine may be common in my native land. Of the Epidendrum myrianthum you mention, I have fine plants to go by next packet. Warcscevicz never saw this plant, or if he did he never could get it to England as its habitat is 60 leagues from this. My impression is that the only plants of it that could ever have gone were some which some other Belgian could not pay the freight on, and which S—— bought for 13*l.*, and sold them by auction at Stevens', and I recollect seeing them there sell for 30*s.* and 40*s.* each as Epid. polyanthum. But you have my drawing of the colours and a specimen in spirits, and remember it is as sweet and as handsome in its beautiful cluster as Vanda suavis. Now I will venture to give you a detail of my journey to the Alatepeque frontier of Honduras—take Mr. Baily's map and I will trace you my route, a hitherto new one to me, and I question if traversed by any interested in horticulture before.

1854, *October* 30.—I started in a southerly direction by Arrasola to Quajiniquilapa, where I breakfasted the following day. Near Arrasola abounds Odontoglossum bicallosum, O. læve, climate 60° and 65°. Towards "los Verdes" I found the evergreen seeds No. 110, the plants dried specimens Nos. 1 (a charming yellow Bignonia), 2 and 3 (a pretty Melastomad), with seeds of the two last under same numbers; the climate of these last getting warmer as I descended the mountain of los Verdes to Cerro redondo, 11 leagues, where I slept. Next morning, 31st October, passed through Mal pais, where the vegetation is almost coast; near a rivulet enormous Marants; and of Orchids only Oncid. sphacelatum, Notylias, and Oncid. roseum, with lots of Pipers and Mosses, Lichens, &c. Getting out of the forest I picked up seeds No. 57, a Leguminosa, but not in flower. Breakfasting in Quajiniquilapa, I saw before the door of the house a fine lump of Oncid. Suttoni; it had a mass of flowers. We now kept an easterly direction to Esclavos, and crossed the river of that name, and on towards El Oratorio, the road through a dense forest: here we have fine plants of Cattleya Skinneri, Epid. Stamfordianum, Cycnoches Egertonianum, Notylias, Oncid. sphacelatum, and Epid. macrochilum roseum, with Stanhopeas venusta and saccata. I put up in a village four leagues from Quajiniquilapa, called the Guapinol, from the circumstance of several trees of that fruit growing here, and, 1st November, started again in a northerly direction up a steep mountain covered with trees and Chids, such as I mentioned yesterday, and in addition Sophronitis cernua. We ascended some 1000 feet into a region of solely Pine trees, and about 200 feet higher came on splendid Oaks all covered with Orchids, principally Oncid. Wentworthianum, Epid. electum striatum, and Lycaste cruenta, with Stanhopea venusta—climate about 68°. As we proceeded we came upon an extensive table land all in pasture to the village of Sacualpa or Asacualpa, a celebrated place for robbers. At either entrance of this town there is a gallows erected to keep the people in remembrance of the reward attending their good deeds. After leaving Sacualpa we came into pretty undulating ravines, in one of which, on a river side, I found the pretty shrub No. 5 (a Malpighiad near Bunchosia), and an immense quantity of Orchids—Brassavolas glauca and venusta, Brassia verrucosa, remarkably fine plants; Cyrtoc. maculatum, Lycaste cruenta, Oncid. leucochilum, &c.—as many of these plants as would load a ship in three miles distance, while, as we ascended a little higher, we found in addition Barkeria Skinneri, now in glorious flower. This plant, however, we can never find in masses, single small plants, but most brilliant in its colours; and I observe the colder the climate the finer the colour, not too shady in its habitat, and yet not much exposed to the sun. The natives make collections and place them on the trees before their doors in masses to sell the flowers for the ornamenting the altars of the churches at Christmas; but principally the day of the Conception, December 8, which gives a vernacular *Flor de la Concepcion* and *Flor de Pascua*, by both of which names this really pretty Orchid is known in this country. About two leagues from Asacualpa we descend a steep hill, and come on very extensive plains, which continue till we reach the river Paz, which crossing we again ascend a slight acclivity of limestone rocks, where the only vegetation is Grasses and Pines. On one side of the road, having dismounted, I found the Mimosa seeds, No. 63, a very pretty sensitive plant, forming a bank which on my approach was all set in motion. Continuing through now a region of scoriæ and Acacias, stunted Mimosas, &c., we crossed another beautiful river, and entered on a magnificent plain with a great many trees of the Crescentiad family, on which I found in immense quantities Lælia acuminata, while the hillocks which from time to time rose on this plain bore quantities of the Maguey, some in flower—climate 69° to 75°. We got to the town of Jutiapa at six o'clock, having ridden 12 leagues this day, 30 leagues from Guatemala.

Nov. 2.—Leaving Jutiapa, which is a considerable town and the head-quarters of the Corregidor of the department, we continued along the plain now in a northerly direction to a village called Achuapa, the country void of trees, and hence no Orchids; but on some fine Acacias in a village called San Chin, I saw enormous masses of Loranths in full flower, the seeds of which I sent by last packet in gum. [They were all dead upon arrival] Near Santa Catarina a curious Umbelliferous plant about 6 to 8 feet high, covered with fruit, attracted my attention much—seeds No. 72. We stopped at Santa Catarina, 8 leagues from Jutiapa.

Nov. 3.—From Santa Catarina to Aguablanca we cross a beautiful river, and now in warm climate pass over scoriated rocks, some places showing beautiful sheets of lava. Principal vegetation Mimosas and Acacias, here and there a solitary Epid. macrochilum roseum. My attention was attracted by a shrub which is really a gem, No. 12 (one of the corollate Euphorbias). This was without seeds yet, but I hope to receive them from the mines, where I also found it abundantly. The hill sides for leagues shone again with this lovely plant—climate 70°. Also exquisitely beautiful is the Bucaro, No. 108 (another fine Bignoniad), very common here; but how much I wish they had this in the conservatory at Chiswick! I send seeds also now, and have often done before; but it is very difficult to preserve them, as you will see, and more so to raise them in Europe. We have no finer thing in this country than this; the flowers are always in such dense masses; it grows about the same size as the Cestrum in the conservatory at Chiswick. From Aguablanca I found nothing particular till I got to Caguasaltepeque, where we slept.

Nov. 4.—Leaving this farm-house, in the intricacy of half a dozen cattle tracks, we lost our way, and I found myself on the summit of a high hill covered with a curious Grass specimen, No. 9 (Ceresia), and also quantities of a pretty pink flower, No. 8 (a Polygala). These I found nowhere else. The faces of the rocks covered with Bromelias and Ferns. Climate about 68°. A few Pinus ochra (!) growing, but stunted for want of soil and great exposure to a burning sun. Waiting an hour till my servant could find a path to extricate me, I amused myself searching for plants, but nothing worthy of preserving except the above. By hauling our mules and climbing we got to a farm-house on the opposite side of the mountain, and thence into the high-road (!) again. Nothing remarkable till we reached la Concepcion, and from there we ascended a league the mountain of Alatepeque to the Mine of San Pantaleon, an elevation of about 5500 feet above the level of the sea. Here I remained inspecting metals under ground for three weeks. The ravines on this mountain contain many examples of rare vegetation, the principal object from its beautiful foliage, the Liquid Amber tree, which grows to all sizes, even to 3 and 4 feet in diameter, and 40 to 60 feet high. But Oak and Pines are also equally abundant. You will find two boards, which embrace the dried specimens, are what we find there most useful for our works. I now refer you to the list of seeds which I collected, where I give a description of their natures and climate, and I feel convinced, from the temperature of the mountains there, a cool greenhouse, if not out of door spring and summer in England, will be found adapted for them. I went to a mountain near, about 1000 feet higher, and amongst enormous trees of Oak and Cedar, but only in Oak trees, where the barks were covered with Moss, Lichen, and Tillandsias, I found Arpophyllum giganteum in bloom; but, as I have often said, until this plant is seen in England as I have seen it no one will ever credit its beauty. A specimen can only be sent in a bottle, as from its habit drying it spoils its appearance. Where I found it luxuriating was in cool damp spots, seldom ever seeing the sun, and certainly subject to frosts at this season, and never warmer in our hottest weather there than 58° and 60° of Fahr., and oh! such colour and such a mass of flower. In this same habitat I found Odont. cordatum, but poor and shrivelled; where 10° warmer it was fine. No. 53, a new [yes] Odont., leaves and bulbs like pulchellum; 54, a plant like E. arbuscula; 55 (a new grassy Epidendrum), and 56, with two other distinct species. I send all the seeds to Mr. James Veitch and the list, and I tell him to send it to you along with the dried specimens, and if there be anything which strikes you as remarkable let me know the number and particulars of it, and I can send seeds afterwards, as our medical man who accompanied me in my expeditions to the Mines I have so far smitten that his leisure time will be given to making collections of plants, insects, &c., and a finer field I never saw; and sure am I if he experiences half the pleasure I have enjoyed in travelling through these countries, he will find his time delightfully employed. *G. U. S.*

Societies.

Linnæan, *April* 3.—The President in the Chair. Specimens of Hierochloe borealis, gathered by Mr. R. Dick, at Thurso, Caithness, presented by W. Gourlie, Esq., and of Epipogium aphyllum, gathered by Mrs. Anderton Smith in a woody dingle on the banks of Saley Brook, Tedstone, Herefordshire, in July, 1854, presented by E. Lees, Esq., were placed on the table; together with pods of Wistaria sinensis, and other fruits from China, presented by D. Hanbury, Esq. The conclusion of Mr. Bunbury's remarks on the botany of Madeira and Teneriffe was read. This portion of the paper referred to the botany of Teneriffe. At Santa Cruz, Mr. Bunbury remarks, a very singular appearance is given to the littoral mountains by the round pale green bushes or clumps of Euphorbia canariensis, which are dotted over them in such a way as to produce a curiously spotty effect, that strikes the eye at a considerable distance. On the rugged cliffs eastward of the town, and at the mouths of the little valleys which intersect them, the peculiarly exotic character of the vegetation—much more strikingly so than that of Funchal—is at once apparent. There is the Euphorbia canariensis, closely resembling the succulents of Caffraria; the singular and graceful Plocama pendula, a thoroughly Canarian type; and the Kleinia neriifolia, and Euphorbia piscatoria. These four plants give the distinctive botanical physiognomy to this part of the coast. The deep valleys on the coast north east of Santa Cruz are full of interest. The steep rugged hills are dotted over with the Euphorbias, Kleinias, &c.; and higher up where the valley narrows the rocks are covered with Selaginella denticulata. Several Ferns grow on the rocks, in particular Nothochlæna Marantæ, Ceterach aureum (which Mr. Bunbury thinks a variety of C. officinarum) Gymnogramma leptophylla, Adiantum capillus Veneris, Davallia canariensis and Polypodium vulgare. Humboldt was certainly misinformed when he restricted the list of Ferns found in the region of the Vine in Teneriffe to two Acrostichums (Nothochlænæ), and an Ophioglossum. The six above-mentioned all grow within the region of Euphorbias, and much below its upper limit. The beautiful neighbourhood of Orotava, on the north-west coast, has quite a different botanical character. As the climate is less dry and more temperate, so the vegetation has less of an African aspect. The great abundance of Date Palms in the valley of Orotava, and some of the other valleys of that coast forms a striking feature in the landscape, though the Phœnix does not appear to be indigenous to Teneriffe. The Dracæna is a scarcely less conspicuous feature in the scenery, but though indigenous to the island, almost all the trees which occur in this valley are cultivated. The famous Dragon tree of Villa de Oratava, so well known through Humboldt's description, is still in existence—a ruin, indeed, but a noble ruin; its foliage is still fresh and flourishing, but the tree has been much shattered, and has lost many branches within the last few years. By Mr. Bunbury's measurement, the part that remains entire of the trunk is 30 feet round. This is from edge to edge of the hollow, and the width across the hollow is 12 feet; this measurement was taken at 8½ feet above the roots. Another tree, flourishing and comparatively young, which stands beside a convent at Realejo de Arriba, had a trunk 14 feet 4 inches in circumference at 4 feet from the ground. There is a still finer one at Icod de los Vinos. About the level of Villa de Orotava (1000 feet), or a little below it, the Ferns begin to be very abundant and beautiful, and in company with Houseleeks profusely adorn the rocky banks and stone walls. Polypodium vulgare and Davallia canariensis are here, as in Madeira, the most abundant kinds; Gymnogramma leptophylla, Nothochlæna Marantæ, Asplenium palmatum, and Nephrodium elongatum, frequent and fine. Some of these occur here and there at a much lower level; and near Garachico, the Asplenium palmatum descends even to the sea-shore. Pteris longifolia is rare, and was seen

only in one spot. Cheilanthes pulchella grows in rather arid rocky spots among the Cistus Montpelensis in the wild rugged country between Icod de los Vinos and the village of La Guancha. The beautiful crimson Cineraria (Senecio Tussilaginis) is one of the greatest ornaments of the lower part of the woody zone. The beautiful forests of Teneriffe have been lamentably wasted, but at Agua Mansa, above Orotava, the woodland vegetation may be seen in all its luxuriance. At Agua Mansa, 4000 feet above the sea, Ferns are abundant and fine, particularly Pteris arguta, Asplenium acutum, and Cystopteris fragilis. Gymnogramma leptophylla ascends to this elevation. On the mountain side, near the wood of Agua Mansa, but separately, not intermixed with the other trees, are a number of fine Pines (Pinus canariensis)—noble and picturesque trees. The representations of this species in the atlas to Webb and Berthelot's work do not give a good idea of its appearance as seen by the writer; it has not the stiff and formal regularity there represented, but rather the free and bold style of branching of the finest states of Pinus sylvestris, while the very long, slender, drooping, and almost pendulous leaves give it a distinct and peculiar character. The beautiful wood of Agua Garcia, of which a glowing but not exaggerated account is given by Webb and Berthelot, is the finest example Mr. Bunbury saw of the forest vegetation of Teneriffe, especially remarkable for the profusion of Ferns and Mosses, and for the gigantic growth of Erica arborea. Here the Woodwardia radicans and Polystichum aculeatum grow to extraordinary size and beauty; and the Trichomanes speciosum mantles the wet overhanging banks with its dark-green glistening fronds. Summing up his observations, Mr. Bunbury adds, "The botanical features in the vegetation of Teneriffe most striking to me were—1, in the coast region, the remarkable forms of Euphorbia canariensis and piscatoria, Kleinia neriifolia, and Plocama pendula; the social growth of the Artemisia argentea, covering great spaces of stony and rocky ground with its whitish foliage; the conspicuous abundance, especially on the Orotava side, of cultivated Date Palms and Dragon trees; and in the ravines the striking and peculiar forms of shrubby species of Rumex, Echium, Solanum and Sonchus. 2, in the woody region the prevalence of trees of the Laurel type of foliage; the vast extent of ground occupied by Erica arborea, and the surprising size to which it grows in favourable localities; the abundance of Ferns and hypnoid Mosses in the more damp and shaded situations, and of Cistineæ and Genisteæ on the dry and open grounds; and the noble form of the Canary Pine in the upper part of this zone. 3. The great zone occupied by the Adenocarpus frankenioides above the region of trees, and that of the Cytisus nubigenus at a still higher level.

April 17.—The President in the chair. E. H. Vinen, M.D., and T. Williams, M.D., were elected Fellows. Mr. Van Voorst exhibited a set of British Algæ, named and presented to him by Prof. Harvey. A memoir on some points of the structure of Crustacean Animals, by C. Spence Bate, Esq, was read.

Notices of Books.

Bryologia Britannica (Longmans, 8vo, pp. 445, and 61 copper plates) is a new edition of Sir Wm. Hooker's Muscologia Britannica, with so many additions and alterations by Mr. Wm. Wilson that the original author thinks it necessary to state in a note in front of the work that he is not the author of the novelties here introduced. And Sir Wm. Hooker is right, for he is naturally unwilling to peril the reputation he so deservedly obtained by the work in its original form, by identifying himself with innovations that are little likely to stand the test of criticism. We especially allude to the numerous new genera adopted from German writers, and often founded upon characters most superficial and trifling. What, for example, can be so unscientific and irrational as to separate the genus (!) Rhabdoweissia from Weissia because it has a furrowed and not an even spore case?

Nevertheless, although we wholly dissent from everything belonging to the most modern changes in the names of the genera of Mosses, and although we have nothing to say in favour of the figures introduced since the last edition of the Muscologia Britannica, we must add that the edition before us has many merits of its own. It is more rich in species and synonyms, and will prove of greater use than ever to the young student who is desirous of exercising his acuteness in distinguishing species till lately unknown to inhabit these islands.

New Map of Europe (Edinburgh, Black, in case) represents a perfectly flat surface, nothing but territorial limits, coasts, rivers, and places being introduced. By this plan great clearness is gained, which compensates for the absence of mountains. Mountain ranges, indeed, best occupy a map by themselves, and at all events are to be found in common atlases laid down with sufficient exactness for most purposes. The map before us is well coloured, forms a large folding sheet 3 ft. by 4 ft. 4 in., represents the telegraphic lines, and is accompanied by some well-written descriptive letter-press.

Garden Memoranda.

Gore House, Kensington.—Active operations are now in progress here, in order to have the grounds in as good a state as possible by the 16th of May next, the day on which the Horticultural Society's first garden exhibition is announced to be held. The borders have been dug, the Grass is being mown, walks fresh gravelled, and altogether a very considerable amount of improvement in the appearance of the place has already been effected. An old wall which separated in part the grounds of Gore House from those of the adjoining house has been removed, thus throwing into one piece a large amount of excellent lawn, on which the tents are about to be placed. As regards access to the latter nothing can be more convenient. Exhibitors' vans have only to turn off the Kensington Road, a very short distance down Gore (Park) Lane, out of which they can readily get into a little paddock, in which they can be arranged not more than 20 or 30 feet from the ends of the principal tents. There will thus be even less labour in loading and unloading than at Chiswick, and the vans after being put into their places at first will not require to be moved until the show is over.

On the lawn are sufficient large trees to keep the place shady and cool, should the day be warm and bright; and altogether the grounds seem to be better adapted for a flower show than any yet applied to such a purpose.

Two new roads are being made between the Brompton and Kensington Roads—one on the London side, the other on the Kensington side of Gore House; of these, the end of the latter next the Kensington Road is in a very forward state, and should it not be formally opened to the public on the day of exhibition will at least afford a most convenient site for carriages.

Bank Grove, near Kingston-on-Thames.—The large Camellia reticulata here is now in flower, and, though a little past its best, is still well worth going miles to see. When in perfection it is said to have had 6000 blooms on it all open at one time! It is planted out in a house by itself, and measures rather more than 14 feet in height, and quite as much in diameter. It is, we believe, the finest plant of the kind in the country. Other Camellias, of which there are great quantities here, are also in good bloom.

Mr. Barnes' Nursery, Southampton Street, Camberwell.—The late severe weather has here, as elsewhere, very much retarded out-door operations, which are, however, now being proceeded with as speedily as possible. Beds are at present being formed for Japan and other Lilies. For these the common garden soil is dug out about 9 inches or so in depth, and a mixture of loam and peat is put in in its place, in which the bulbs are planted out of boxes filled with yellow sand, in which they have been found to winter uncommonly well. These Lilies, we need not say, are perfectly hardy, and might be left in the open ground all the year round were it not that in winter slugs are apt to fix upon and eat out the crowns of the bulbs. Treated as above they never fail to make a fine display every autumn. Tritoma Uvaria is another remarkably handsome autumn flowering plant which is deservedly a favourite here, and which should be extensively cultivated everywhere, for when well grown and bloomed what can be more striking or beautiful? Many have, however, found some difficulty in flowering this Tritoma, a circumstance which Mr. Barnes attributes to their having got T. Burchelli instead of Uvaria, the former being proverbially a shy bloomer. Tritomas are Cape plants, and with us somewhat difficult to winter safely, especially if the autumn is wet and sunless, which causes them to grow late and keep full of sap, and then when frost comes it cuts them down. Mr. Barnes has, however, kept a plant of Uvaria in good condition in the open ground by merely putting a layer of tan round its roots, which has successfully preserved it, and now it is beginning to push afresh. Some take the plants up and winter them in boxes filled with sand, or in pots, like scarlet geraniums, and this is certainly a safe plan. Larkspurs are much cultivated here; one of the handsomest of them is Hendersoni, a blue kind with a white eye. A variety called giganteum is also a pretty sort; it much resembles Hendersoni, but the flowers do not stand the sun so well as those of the last-named kind. Roses, both in pots and out of doors, are grown here to a considerable extent. Those in pots are on the Manetti stock, many dozens of which have just been grafted and placed in frames on a tan bed, which affords them a gentle heat. They are in 3-inch pots, and the scion is placed so low on the stock that after the plants have been shifted into larger pots the soil covers the under part of the scion, which soon strikes root and may thus be termed on its "own bottom," and plants thus treated grow three times faster than those struck from cuttings. Some of the outdoor Roses are being transplanted even thus late; but a mulching of stable-yard manure is being put over their roots, and they will be kept well watered as the spring advances. Of tree Carnations we now have varieties of nearly every colour, and all the sorts are grown in perfection here. By means of frequent stoppings, Mr. Barnes keeps them dwarf and bushy, and in that way large quantities of bloom are obtained from them. Now is a good time for putting in cuttings of them, which must not, however, be too young or soft or they will be sure to "fog" off. Pot roots of Hollyhocks are also now in heat to cause them to push a few cuttings, which, as soon as ready, are taken off and struck in a close frame on a tan bed in which there is a little heat. Other popular plants, such as the better kinds of Sweet Williams, Phloxes, Calceolarias, Pelargoniums, Azaleas, Heaths, &c., are also cultivated here, and on the walls we remarked a stock of well-trained fruit trees. Some of the young shoots of a large Glycine against the end of a house have just been brought down to the ground and layered. These will be ready to separate and take next autumn. All evergreen shrubs here have been greatly injured by the winter. The things that have stood best are Box and Hollies. Sweet Bays appear to be dead, and young Deodars are killed to the ground. Common Bays and Aucubas are also greatly cut up.

FLORICULTURE.

Chrysanthemums.—Until comparatively lately few persons were aware of the perfection to which this plant could be brought by skilful cultivation. Being perfectly hardy it has often been permitted to remain in the open ground throughout the year. This has frequently been a cause of failure, amateurs forgetting that although the winters of its own climate are as cold as our own, yet the summer heat is much greater, and consequently the blooming season is accelerated. It is one thing to grow a plant well, and another to bloom it in perfection. In our variable climate it is impossible to calculate with any degree of certainty upon having fine weather in October and November, without which the buds formed in September will not attain perfection, and frequently the early frosts of October cripple them altogether. In order to overcome this difficulty it is necessary to place the plants under glass as soon as the flower buds expand, but it must be borne in mind that air is as necessary as light or heat. By these means the blooming season may be made to last from October till January. The Chrysanthemum exhibitions at Stoke Newington and Highbury have done much to bring this beautiful autumnal flower into notice; in fact none but those who attend these shows can form any correct idea of the size, beauty, or symmetry to which, under proper treatment, it may attain. Such as intend growing specimen plants, or cut flowers for competition, should very soon now have well rooted cuttings. I am aware that many strike them much later, but I prefer having them early. I plant singly in 5-inch pots in good rich soil, and plunge in a warm airy situation. By the middle or towards the end of May I stop them, and shift them into larger pots, and to ensure dwarf bushy plants they should be again stopped in June, and then shifted into larger pots to bloom. During the summer months they are never allowed to flag; for if this once takes place the lower leaves will assuredly fall, and all hopes of fine specimens will be destroyed. Towards the middle of September the plants will have attained their full growth, and it will then be proper to put them under glass; but at the same time, if the weather is fine, I give as much air as possible. The buds will now begin to show themselves; not more than one or two should be allowed to remain on each shoot; liquid manure may at this time be applied with advantage. Under such treatment a fine show of blooms may be confidently expected, even in the most unfavourable seasons. Those who do not desire specimen plants or cut flowers for exhibition, I would recommend to plant their cuttings in the open ground now, to stop them in May, and again in June. By the end of September they will be fine large plants, and as soon as the buds begin to swell they may be taken up with a good ball of earth and planted in 9 or 11-inch pots, and plunged in the open ground for nine or ten days, during which time they should be well watered every day, to prevent flagging; after that time they may be removed to the greenhouse or conservatory, which they will keep gay till January. *S.*

Carnations.—Where it is desirable to have late flowering beds of these, this is a very good time to propagate them for that purpose. Neither knife nor dibber is required, either in preparing the cuttings or pricking them out where they are to strike, nor any artificial heat, further than placing a hand-glass over them when pricked out. Having fixed upon the stem from which you mean to draw the piping, take the former in your left hand, and the top of the latter, with four or more leaves between the two first fingers and thumb of your right, making a steady gentle pull; the stem will give way at the place most suitable for its making roots. Then, on a south border, where a place has been prepared for their reception by removing the surface equal to the area of the open end of the handlights destined to cover the cuttings, to the depth of 2 inches, and filled with pure sand neatly levelled, but not pressed with a spade or other instrument, the cuttings may be inserted, the sand settled with a gentle watering, and the handlight put over them. Treated in that way, one may safely calculate upon nine-tenths of them taking root. Plants so obtained will flower till the winter sets in. *H.*

SEEDLINGS.

Cacti: *J S.* Crosses between Cereus speciosissimus and C. crenatus are scarce: those we have seen were in the Garden of the Horticultural Society and from Sir Philip Egerton. Yours, though not very novel in colour, are certainly extremely handsome, and we need not say well worth growing. The small but beautiful kind marked No. 4, we are unacquainted with.

Miscellaneous.

The Peach (Amygdalus persica) is, according to the common opinion, of Persian origin. Diodorus Siculus says that it was carried from Persia into Egypt during the time that Cambyses ruled over that country. It is supposed to have been transported from thence into Greece, and, after a lapse of time, into Italy, where it only began to be known about 20 years before the birth

of Pliny, that is, about seven years before the Christian era, and it appears that Columella was the first to treat of its cultivation there. According to Nicander it was brought to Greece by the agency of Perseus from Cepheia, a locality affirmed by some to have been in Persia, by others in Æthiopia or in Chaldæa. The Peach is also spoken of by Theophrastus, Dioscorides, and other Greek writers. We must therefore conclude that this fruit was well known in the East very long before its introduction into Italy. Many ancient writers, including Athenæus and Pliny, and some more recent ones, as, for instance, Marcellus Virgilius, in his Commentaries on Dioscorides, confound the Peach with the persea, a fruit the identity of which is uncertain, some supposing it to be a Cordia, others a Balanites. Macrobius again confounds the Peach with the persicum of Suevius, which is the Walnut, and with that of Cloatius, which is the Citron; all fruits resembling the Peach in nothing but in the name, a clear proof that it cannot have been in their days by any means a common fruit. How few were the varieties of Peach known to the ancients appears from Dioscorides, who only names two; from Pliny, who enumerates five, and Palladius four only, giving at the same time accurate information on the mode of cultivating them. With regard to the introduction of the Peach into Tuscany, it appears that several varieties were known already in the days of the Republic, but that the greater number were, as in the case of other fruits, due to the exertions of the Medici sovereigns. Matthioli, in the 16th century, enumerates a considerable number as then in the possession of Tuscan cultivators; Micheli, under Cosmo III., has 43, and in the drawings of Castello are represented about 30. That called Poppe di Venere (the Late Admirable of our Horticultural Catalogue), is supposed to be one of the most ancient in Italy, and is mentioned by Agostino del Riccio and Micheli, under the name of Pesche Lucchesi. Although all the evidence collected by Professor Tarigoni tends to show that the Peach was originally brought from Persia, and he therefore does not consider it necessary to proceed further with the investigation, yet no traveller whom we can rely upon has ever found it growing really wild there or anywhere else. We are therefore left in doubt whether its native stations remain yet to be discovered, or whether its original wild type must be sought for in some species of Amygdalus known to be indigenous in the East. It has been more than once suggested that this original parent is no other than the common Almond, a conjecture founded perhaps on the similarity in the leaves and in the perforations of the endocarp, but rejected as absurd by those who attach even generic importance to the succulence of the indehiscent pericarp. This point cannot be decided with any degree of plausibility until we shall have a better knowledge of the different forms which the fruits of wild Amygdali may assume under various circumstances; but we may mention, as circumstances in some degree favouring the supposition that some kind of Almond is the parent of the Peach, the ancient tradition referred to by Targioni (with the remark that it is contradicted by Pliny and by common sense), that the Peach in Persia was poisonous, and became innocuous when transported to Egypt; and the case quoted of a supposed hybrid, raised in 1831, in Sig. Giuseppe Bartolucci's garden, at Colle di Val d'Else, from a Peach stone which produced fruits at first exactly like Almonds, but which, as they ripened, assumed the appearance and succulence of Peaches, whilst the kernel remained sweet and oily, like those of Almonds. We might also refer to some bad varieties of Peach with very little juice to their pericarps, although we do not know of any which assume the flattened form of our Almond, a distinctive character which appears to us to be of considerable importance. The foliage and flowers of the two trees show little or no specific difference. *Journal of Horticultural Society.*

Calendar of Operations.

(*For the ensuing week.*)

PLANT DEPARTMENT.

Conservatory, &c.—While cold drying winds and bright sunshine prevail considerable attention will be necessary to maintain a moist healthy atmosphere in this house, and no effort necessary to secure this should be spared: for it is folly to expect flowers to last in a dry hot atmosphere. A thin shade will of course be used to break the force of the sun, and in giving air every care must be used to avoid drying currents, opening the top ventilators only, so long as these may suffice to prevent too high a temperature, and every available surface of bed or border should be kept constantly moist, in order to secure plenty of evaporation to counteract the drying effects of the external atmosphere. Give frequent attention to climbers in free growth, regulating the young wood before it gets entangled, and see that Hardenbergias, &c., in bloom are properly supplied with water at the root. At this busy season there is great danger of neglecting the winter blooming favourites, such as Epacrises, Daphnes, &c., but if these are to be had in anything like perfection next season they must be properly cared for now. Show houses are generally kept too close and warm for Epacrises and such things, and in this case the plants should be removed to the greenhouse directly they are out to bloom, affording them a rather damp and shady situation for a few weeks. Attend to repotting such as have started into growth after being cut back, and keep them moist and rather close until the roots get hold of the fresh soil. Shift and attend carefully to tree Mignonette for flowering next winter, and see that the tree Violets are not infested with spider. Stove.—The stock here will now be growing freely, and every possible care should be exercised to secure strong vigorous wood. Attend to repotting young stock before the plants sustain any check for the want of pot-room, and see that everything is well supplied with water at the root.

FORCING DEPARTMENT.

Pineries.—Where there is not sufficient means of maintaining a thoroughly moist night temperature the growing stock may be dewed with the syringe in the morning, but where plenty of evaporation can be obtained from tanks or evaporating pans the syringe should be used over the foliage only in the afternoon, and then but lightly. Heavy syringing tends to render the soil about the collar of the plant too wet, and makes it difficult to judge of the state of the ball as to moisture and keeping the axils of the leaves constantly full of water is not favourable to compact sturdy growth. See that none of the young stock is allowed to suffer for want of pot room or to get too dry at the root for a short time's neglect at this season may end in a great many of the plants fruiting prematurely. Maintain a brisk bottom-heat, as near 90° as can be managed, but on no account exceed this, and keep the atmosphere as warm as the plants will bear without growing weakly. Successions, if all right at the root and near the glass, may safely be kept at from 65° to 70° at night and 75° to 85° with sun-heat, and plants swelling their fruit, if afforded a thoroughly moist atmosphere, will enjoy a night temperature of 70°. Give these plenty of manure water at the root. Vineries.—As soon as the fruit is ripe in the early house discontinue the use of fire-heat as far as the state of the weather will admit, and keep the atmosphere cool in order to prevent the increase of spider and preserve the foliage in a healthy state as long as possible. Where the borders have been covered with fermenting materials this should not be removed in the present state of the weather where the fruit is colouring, but where the fruit is ripe the border should be uncovered so as to expose it to the sun and air and prevent the growth of laterals, &c. See that Vines in pots and boxes are well supplied with manure-water at the root. Give timely attention to the work of disbudding, stopping, and tying in the shoots in succession houses, and endeavour to get the fruit thinned directly the berries are sufficiently large. Peaches.—There will be little trouble from insects where the trees are in a healthy vigorous state; but the excessively dry state of the atmosphere and cold nights, rendering fire-heat still necessary, is a very favourable state of things for red spider, and any weakly or overcropped trees should be carefully watched. See that the inside borders are properly supplied with water, keeping the atmosphere moist, and that every means are used to keep the trees in vigour, and if spider makes its appearance give the trees repeated washings with the engine until the enemy is thoroughly eradicated. Thin the crop severely directly the fruit is stoned, and avoid leaving more than the trees can bring to perfection, which would only result in small, flavourless fruit, a continual war with insects, and greatly injure the trees for next season. Keep the young wood thin and neatly tied in, so as to expose all parts of the trees equally to light, &c. Give air freely to houses where the fruit is ripening; but do not let cold winds blow through the house too freely.

FLOWER GARDEN AND SHRUBBERIES.

The long-continued cold northerly winds render the management of bedding stock unusually difficult this season; for it is still dangerous to risk even the hardier kinds from under the protection of glass. All that can safely be done until the weather changes, in the way of hardening the stock, preparatory to its being planted out, is to give as much air as circumstances will admit, without injuring the plants; and to place Calceolarias and the stronger Verbenas in turf pits, where they can be securely protected at nights, and sheltered from the drying winds. Such things, when removed to cold pits, should be planted out in fine very sandy soil, which will save trouble in watering, and be much better for the plants than keeping them confined in small pots. Tender annuals that have been raised in heat should be pricked out in light soil under hand-glasses, in order to get them strong before planting out time. If not already done, hardy annuals should be sown after the first shower, and do not forget plenty of Mignonette and Stocks, the fragrance of which will always render them favourites. Look over the stock of plants at present in flower, and mark the most admired for propagation at the proper season.

HARDY FRUIT AND KITCHEN GARDEN.

Recently transplanted trees, &c., must be carefully attended to with water, giving the ground a liberal soaking when it is found necessary, so as to thoroughly moisten it, and lightening up the surface with a blunt fork when it becomes a little firm. Be prepared with a supply of tobacco-water with which to attack green fly the moment it is perceived upon the Peach trees, when it will be easily eradicated. Clean and loosen the surface soil about Strawberries, and go over any plantations made late last autumn, and make good where the plants have failed. Take advantage of the dry state of the ground to get manure wheeled upon quarters where it will soon be wanted, and see that there is a good supply being prepared for the Celery crop, for without plenty of old rich manure large crisp Celery can hardly be obtained. Directly the weather becomes more favourable get the spring-raised Cauliflowers and Lettuce planted out, if not yet done, selecting for them a sheltered situation and light rich soil. A few branches of evergreens stuck amongst such things after planting, so as to screen them from the sun, is a great protection, and prevents their being dried up until the roots get hold of the ground. Get Scarlet Runners planted, also French Beans, if not yet done, and give the former an open situation and good deep rich soil, of which they are well deserving. Attend to ridge Cucumbers, Vegetable Marrows, Tomatoes, &c., and endeavour to get strong stocky plants, keeping them where they can be placed near the glass and freely exposed to air on fine days, and avoid getting them leggy and tender by too close treatment.

STATE OF THE WEATHER AT CHISWICK, NEAR LONDON.
For the week ending April 26, 1855, as observed at the Horticultural Gardens.

Notices to Correspondents.

Dry Rot: *An Old Sub.* A good wash of corrosive sublimate effectually stops the progress of dry rot, provided all the wood attacked by the fungus is really cut away.

Fennocue: *R R.* This is written Finocchio. It is a kind of Fennel, sweeter than usual, and is grown like Celery. But in this country it is never eatable, owing to the want of sufficient natural bottom-heat. Seeds, if procurable, can only be had of the great seedsmen.

Heating: *Sub.* By no means use earthenware pipes for hot water; they are continually leaking either at the joints or sides, and otherwise getting out of repair. At the best they are mere make-shifts, which in the end you would find more costly than good iron pipes. ‡

Insects: *J R.* Each of the seeds of Pinus nobilis sent contained an insect in its interior. In one was a minute white footless grub or larva, and in the two others were two minute white pupæ. They appear to be the immature states of a small hymenopterous insect, and in such case must be parasites, each of which has fed upon and destroyed an insect which had previously devoured the interior of the seed. The fact is quite new to us, and we hope to rear the insects, when we shall be able to speak more positively as to their habits. If you have more of the seeds similarly attacked be so good as to forward them to us.—*L G, Bury.* The beetles and larvæ sent with the pieces of perforated timber are the common Anobium pertinax, an insect belonging to the same genus as the Death watch. Pray inform us what is the kind of timber of which the specimens sent are pieces. *W.*

Labels: *D L.* We believe that stamped gutta percha labels answer very well; their great fault is the difficulty of reading them. If they are allowed to swing the wire must not rub upon the hole, but must be tied tightly round them. Lead is much better; no more trouble, and not costly.

Names of Fruits: *S K.* Your Pear is the Easter Beurré.

Names of Plants: We have been so often obliged to reluctantly decline naming heaps of dried or other plants, that we venture to request our correspondents to recollect that we never have or could have undertaken an unlimited duty of this kind. Young gardeners, to whom these remarks more especially apply, should bear in mind that, before applying to us for assistance, they should exhaust their other means of gaining information. We cannot save them the trouble of examining and thinking for themselves; nor would it be desirable if we could. All we can do is to *help* them—and that most willingly. It is now requested that, in future, not more than four plants may be sent us at one time.—*S M.* Apparently fragments of Ranunculus bulbosus starved with cold.—*Kentish Man.* Leptospermum scoparium.—*R H P.* Dendrobium fimbriatum.—*W W.* Plants not in flower cannot be named.—*A Lady* 1, Melianthus major. 2, Not recognisable by the leaf. Paint your vases with good white lead, or good anti-corrosion paint.—*Sub.* Corydalis solida.—*W G.* Aphelexis macrantha purpurea. We are unable to name the Azaleas.—*W B.* Saponaria calabrica. It is hardy in all ordinary winters.—*J S.* Acer Negundo.

Orange Trees: *J H.* As we do not know to what insect you allude as infesting your trees we are unable to offer you advice. Many insects of very different habits attack Orange trees, Camellias, and similar plants.

Rhododendrons: *A Scottish Sub.* It is impossible to name the garden varieties of Rhododendrons by mere inspection of their leaves. That which is so much injured with you may have some ponticum blood in it, but it is a far remove. The other appears to have no arboreum in it, but to be one of the innumerable and invaluable forms of R. catawbiense.

Skeleton Leaves: *A Lady.* Steep them for weeks in rain water in a warm place, freely exposed to air; when nearly ready add a small quantity of muriatic acid to it. A great deal of care is however, required in picking out with needles the parts of the leaves that are not rotted away. ‡

The Argan Tree. *W L.* This is a bush or small tree from the N. of Africa, and unable to bear our climate. Its fleshy fruit, something like an Olive in appearance, is eaten by cattle; and the stones, when crushed, yield a good deal of oil. You will find a full account of it in Hooker's "Journal of Botany" for the year 1854. We believe that live plants exist in the Royal Botanic Garden, Kew.

The Mangosteen: *R H.* We shall be happy to give you an order to see the plant if you will favour us with your address.

The "Shamrock": *J S.* The real Shamrock is Oxalis acetosella. Any 3-leaved Clover is the modern apology for it.

Vines: *W W.* You can do nothing better under the circumstances.

*** As usual, many communications have been received too late, and others are unavoidably detained till the necessary inquiries can be made. We must also beg the indulgence of those numerous correspondents, the insertion of whose interesting contributions is still delayed.

THE FOLLOWING MANURES are manufactured at Mr. LAWES' Factory, Deptford Creek:—Turnip Manure, 7l. per ton; Superphosphate of Lime, 7l.; Sulphuric Acid and Coprolites, 6l.

Office, 69, King William Street, City, London.

N.B. Genuine Peruvian Guano, guaranteed to contain 16 per cent. of ammonia. Nitrate of Soda, Sulphate of Ammonia, and other Chemical Manures.

WHEAT AND OTHER MANURES ON SALE.—The success attending the application of the manure specially adapted for Wheat during the last two years, induces the undersigned to again offer it to the Agriculturists with confidence. Also Superphosphate of Lime, Blood Manure, Guano, Nitrate of Soda, Gypsum, Salt, Peat Charcoal, and all other Manures of known value.—Apply for Prices Current to MARK FOTHERGILL & CO., 204a, Upper Thames Street, London.

PATENT SANITARY SEWAGE COMPANY'S NITRO-PHOSPHATED CARBON OR BLOOD MANURE, 5l. 10s. per ton; delivered in London, bags included. Each ton contains 1350 lbs. Blood and 11 per cent. of Phosphate of Lime.—Agents throughout the country.

22, Lincoln's Inn Fields, London.

CORN MANURE FOR SPRING SOWING.
CONCENTRATED URATE FOR GRASS, RAPE, AND ALL ROOT CROPS.
SUPERPHOSPHATE OF LIME.

THE LONDON MANURE COMPANY continue to manufacture the above Manures, which have been used with so much success for the last 14 years.

The London Manure Company also supply PERUVIAN GUANO (direct from importers' warehouses), Nitrate of Soda, Sulphate of Ammonia, Fishery and other Salts, Bone Dust, and every artificial manure of known value. EDWARD PURSER, Sec.

Office—40, Bridge Street, Blackfriars.

ARTIFICIAL MANURES, &c.—Manufacturers and others engaged in making ARTIFICIAL MANURES may obtain every necessary instruction for their economical and efficient preparation, by applying to J. C. NESBIT, F.G.S., &c., Principal of the Agricultural and Chemical College, Kennington, London. Analyses of Soils, Guanos, Superphosphates of Lime, Coprolites, &c., and Assays of Gold, Silver, and other Minerals, are executed with accuracy and dispatch.

Gentlemen desirous of receiving instructions in Chemical Analyses and Assaying, will find ample facility and accommodation at the College.

THE LANDS IMPROVEMENT COMPANY, INCORPORATED BY SPECIAL ACT OF PARLIAMENT FOR ENGLAND AND SCOTLAND.—To Landowners, the Clergy, Solicitors, Surveyors, Estate Agents, &c.—Loans may be contracted for the execution by the proprietor or by the Company of every landed improvement, especially Drainage, Building, Clearing, Enclosing, Warping, Irrigation, Embanking, Reclamation, Roads, Planting, Machinery, &c. The plans (of buildings), specifications, and estimates are prepared by the proprietors, and are submitted to the approval of the Enclosure Commissioners. Proprietors may avail themselves of the powers of the Act to recover from the inheritance their own funds to be expended on improvements. They may also apply jointly for the execution of a general improvement, such as a common outfall, &c. For forms of application, &c., apply to the Hon. WM. NAPIER, Managing Director, 2, Old Palace Yard, Westminster.

THE GENERAL LAND DRAINAGE AND IMPROVEMENT COMPANY

INCORPORATED BY SPECIAL ACT OF PARLIAMENT.
Offices, 52, Parliament Street, London.

DIRECTORS.

HENRY KER SEYMER, Esq., M.P., *Chairman.*
SIR JOHN V. SHELLEY, Bart., M.P., *Deputy-Chairman.*

George Thomas Clark, Esq.
John C. Cobbold, Esq., M.P.
Sir William Cubitt, F.R.S.
Henry Currie, Esq.
Thomas Edward Dicey, Esq.
William Fisher Hobbs, Esq.
Edward J. Hutchins, Esq., M.P.
Sir S. M. Peto, Bart.
William Tite, Esq., F.R.S.
William Wilshere, Esq.

Empowered to execute Drainage, Road-making, and other Land Improvements, and to Erect Farm Buildings upon Estates under Settlement, Mortgage, or otherwise; or Church property, and without investigation of Title to charge the whole outlay and expenses upon the Estate, to be repaid by instalments spread over any period determined by Landowners within the limits of 30 years for Drainage and Roads, and 31 years for Farm Buildings. Landowners may arrange with the Company for the execution of the works by their own agents, with the use of their own or the Company's Capital. WILLIAM CLIFFORD, Sec.

THE PATENT NITRO-PHOSPHATE OR BLOOD MANURE COMPANY.—Provisionally Registered pursuant to the Act 7 & 8 Vict. c. 110.

Trustees.

Abel Smith, Esq., Jun., M.P., 2, Halkin Street West.
Charles Dimsdale, Esq., Essendon Place, Herts.
Edward Ball, Esq., M.P., 8, Belgrave Road, Pimlico.
Major-Gen. Hall, M.P., Weston Colville, Linton, Cambridge.
John Brady, Esq., M.P., Warwick Terrace, Belgrave Square.

Directors.

Chairman.—Jonas Webb, Esq., Babraham, Cambridgeshire.
Deputy-Chairman.—John Sharp, Tower Villa, Queen's Road, Regent's Park.

Edward Bell, Esq., Tottenham, Middlesex.
John Clayden, Esq., Littlebury, Essex.
Richard Hunt, Esq., Stanstead Abbot, Herts.
Thomas Knight, Esq., Edmonton, Middlesex.
Robert Leeds, Esq., West Lexham, Norfolk.
Robert Morgan, Esq., 72, Camden Villas, Camden Town.
Thomas Nash, Esq., Great Chesterford, Essex.
James Odams, Esq., Bishop Stortford, Herts.
John Collins, Esq., Middleton Square, Pentonville.

With power to add to their number.

Bankers.—Messrs. Barnett, Hoare & Co., Lombard Street.
Auditor.—James Caird, Esq., Baldoon, and 9, Little Ryder Street, St. James's.
Solicitors.—Messrs. Kingsford & Dorman, 23, Essex St., Strand.
Secretary and Chemist.—James Taylor, Esq., F.C.S.

MANUFACTORY, PLAISTOW MARSHES, ESSEX.

The Directors of the above Company beg to call the attention of their friends and the Agricultural Community to their Blood Manures for Corn and Turnips, which have been used with the greatest success in all parts of England, and to assure them that having now erected commodious Works, with every suitable convenience for carrying on the manufacture on a large scale, under the management of an experienced practical Chemist, the Agriculturists of this country may depend upon having a manure of proved high quality, which the Directors guarantee to be genuine. It is sent out in the form of a fine friable powder, which may be sown by the drill or hand with the utmost facility.

They beg to caution the public against the attempts of spurious imitators, who, since the introduction of this Manure, have proceeded to make one possessing similar qualities. As security, therefore, to the purchaser, every bag is marked "Odams' Patent Blood Manure," and sold only by the authorised Agents of the Company.—Corn and Grass Manure, 7l. 10s. per ton.

Directions for Use.—From 2 to 3 cwt. per acre, according to the condition of the soil. It may either be drilled in with the Seed, if sown broadcast; if the latter, it should be well harrowed in. Turnip Manure, 6l. 10s. per ton.

Delivered at any Railway Station or Wharf in London.

Applications to be made to ODAMS, PICKFORD, & KEEN, Agents for the above, 35, Leadenhall Street, London.

PERUVIAN GUANO, Bolivian Guano, Superphosphate of Lime, Nitrate of Soda, Sugar Scum, and every description of Artificial Manures, Linseed Cakes, &c.

WM. INGLIS CABNE, 10, Mark Lane, London.

COLLEGE OF AGRICULTURE AND CHEMISTRY, AND OF PRACTICAL and GENERAL SCIENCE, 37 and 38, Lower Kennington Lane, Kennington, near London.

Principal—J. C. NESBIT, F.G.S., F.C.S., &c.

The system of studies pursued in the College comprises every branch requisite to prepare youth for the pursuits of Agriculture, Engineering, Mining, Manufactures, and the Arts; for the Naval and Military Services, and for the Universities.

Analyses and Assays of every description are promptly and accurately executed at the College. The terms and other particulars may be had on application to the Principal.

CHEMICAL ANALYSIS.

MR. H. MEDLOCK (formerly Chief Assistant in the Royal College of Chemistry) begs to inform Agriculturists that he undertakes the Analysis of Soils, Manures, &c., on moderate terms. Mr. Medlock also gives instruction to Gentlemen in Agricultural Chemistry at his private Laboratory, 20, Great Marlborough Street, London.

THE CONSULTING CHEMIST of the Royal Agricultural Society of England has removed his Laboratory to 15, Welbeck Street, Cavendish Square, where all communications and substances for analysis should in future be addressed. The Laboratory is open to Gentlemen wishing to study Agricultural Analysis, for which purpose it offers considerable advantages.

BATH AND WEST OF ENGLAND AGRICULTURAL SOCIETY.—GRAND POULTRY EXHIBITION to be held at Tiverton on the 6th, 7th, and 8th June, 1855. OPEN TO ALL ENGLAND. Prize Lists and Certificates obtained of the Secretary, Mr. KINGSBURY, Hammet Street, Taunton. Entries finally close on the 10th of May.

TESTIMONIAL TO J. B. LAWES, Esq.—The Committee beg to inform those interested in the above undertaking, that the New Laboratory is expected to be ready for presentation in May or June, until which time the Subscription List will remain open, to afford an opportunity to any who may still wish to associate their names with this acknowledgment of Mr. Lawes' services.

Communications to be addressed to
Mr. W. KERL, Hon. Sec., Harpenden.

TO ARTIFICIAL AND CHEMICAL MANURE MANUFACTURERS AND MANUFACTURING CHEMISTS.

MR. COOKE, CHEMICAL ENGINEER & MANUFACTURING CHEMIST, contracts for the erection of Sulphuric Acid Chambers, and Chemical Plant generally on the most approved forms. Practical instructions from 12 years' experience in the trade given in the working of Acid Chambers, and in the manufacture of all kinds of Artificial Manures, Superphosphates, and Guanos. Receipts for the best mixtures furnished, and other information on application.—For terms, &c., apply by letter to 6, St. Thomas Terrace, Newcastle-on-Tyne.

SAMUELSON'S REGISTERED LAWN MOWING MACHINES. To cut 16, 19, 22, and 25 inches wide. The Registered Improvement renders unnecessary the great care requisite in the handling of these Machines on the old plan. All that is now required can be done *by any unskilled labourer*, who has only to push the Machine before him, the Registered Adjustment insuring a clean cut of uniform height, and preventing the knives from cutting into the soil, however uneven the ground may be. Illustrated Price Lists, with copies of Testimonials, and a Catalogue of his other Agricultural Implements, may be procured, post-paid, on application to the Manufacturer,

B. SAMUELSON, Britannia Works, Banbury, Oxon.

The above may also be procured at the principal Agricultural Implement Depôts in London, and of all respectable Ironmongers and Seedsmen in the country.

BUDDING'S LAWN MOWING MACHINES.—For Hand-power: 16 inches, 5l. 10s.; 19 inches, 5l. 15s.; 22 inches, 6l. For Horse-power: 26 inches, 8l.; 28 inches, 11l.; 30 inches, 15l.; including packing case and delivery free in London, Liverpool, Birmingham, Bristol, and Manchester.

WATERING ENGINES, on Wheels, Wood Tub and Handle: 15 gallons, 4l.; 20 gallons, 5l.; 30 gallons, 7l.; in Birmingham.

LADIES' HAND SYRINGES, 4s.; full size, 8s. 6d., 10s., and 14s. each.

Garden Rollers, Vases, Seats, Flower-pot Stands, Steel Digging Forks, Spades, and every conceivable instrument for gardening operations, may be obtained from MAPPLEBECK and LOWE, Birmingham.

WEIR'S CANVAS HOSE PIPING, for Liquid Manure or Water, protected from rot.

1	1¼	1½	1¾	2	2¼	2½	2¾	3 inches diameter.
4d.	4½d.	5d.	6d.	7d.	7½d.	8d.	9d.	10d. per foot.

Illustrated Catalogues and samples free per post. Terms, cash on delivery.—EDWARD WEIR, Agricultural Engineer, 16, Bath Place, New Road (six doors west of the Hampstead Road), London.

WATER YOUR GARDENS AND MANURE YOUR LANDS WITH GUTTA PERCHA TUBING.

By attaching the Tubing to Cisterns or Butts, Manuring Carts, or to the Main, it will found a ready, an easy, and a most pleasing mode of watering gardens and manuring land. We select an extract from one amongst the very numerous testimonials received:—"That which was a labour by the watering-pot is now rendered a pleasing and recreative pastime, and the garden made an agreeable and healthful rendezvous. No modern appliance has done so much for the garden as this Tubing. Grounds that were neglected, dry, and sterile, are now Flower-beds; and tended, irrigated, and refreshed by genial showers through Gutta Percha Tubing." Half-inch for Gardening, 4d. per foot, medium: 4½d. stout; Brass Branch, with Stopcock and Rose, 5s. 6d., and upwards. Apply for illustrated Price Lists containing instructions to order what is required, to JAMES SHEATH and Co., the Patent Gutta Percha Factory, 35, Old Street Road.

FOR WATERING GARDENS.

HANCOCK'S IMPROVED VULCANISED INDIA-RUBBER HOSE AND TUBING is now manufactured especially for the above purpose; is of greater flexibility than any other description of Hose; is capable of resisting great pressure, and made suitable for attaching to the mains of water-works, or to tanks of high elevations.

WATERING HOSE fitted up with the necessary *brass joints, stop-cocks, branches,* and *spreaders complete.*

VULCANISED INDIA-RUBBER SUCTION PIPES, made any length or size for Pumps or Garden Engines.

VULCANISED RUBBER WASHERS, and also in Sheet, any thickness, for all kinds of steam and water joints, or made any size or figure to order.

All communications and orders punctually attended to, addressed to the Manufactory, JAS. LYNE HANCOCK, Goswell Road, London.

STEPHENSON AND PEILL, 61, Gracechurch Street, London, and 17, New Park Street, Southwark, Manufacturers of Copper Cylindrical and Improved Conical Iron BOILERS, and Conservatory and Hothouse Builders, either in Wood or Iron, respectfully call the attention of the Nobility, Gentry, and Nurserymen to their simple but efficacious method of warming Horticultural and other Buildings by Hot Water.

From the extensive works they have executed, references of the highest respectability can be given, and full particulars furnished on application.

IMPROVED MOWING AND ROLLING MACHINE.

ALEXANDER SHANKS AND SON, Arbroath, Forfarshire, Inventors and Sole Manufacturers, respectfully solicit the attention of the Nobility, Gentry, and Gardeners to this Improved Machine for Mowing and Rolling Lawns. The Machine is in operation in the Royal Gardens at Windsor Palace, Buckingham Palace, and at Osborne, in the Botanical Gardens at Kew, Regent's Park, Manchester, Sheffield, &c.; at Blenheim Palace, Trentham, Cleveden, Elvaston, Broadlands, Woburn Abbey, Clumber, Lilleshall, Castle Howard, Shrubland, Eridge Castle, Enville Hall, Tiptree Hall, Chatsworth, and in many other of the principal gardens in the kingdom as well as in the United States, British America, and on the Continent, where its merits have been fully proved, and its success established.

The machine is made to cut the breadth of 42, 30, 20, and 15 inches respectively, is exceedingly durable, easily managed, and adjusted to cut to the length required. The execution of the work is far superior to what may be attained by the most skilful mower, while at the same time a great saving of labour is effected, and the turf much improved. By the largest machine a Scotch acre may be mowed, rolled, and the Grass collected in one hour.

A. S. and SON have much pleasure in stating that they have made considerable improvements in their 15-inch or hand machine this year, by which the draught is considerably lessened. This machine combines all the merits and advantages of the larger machines with firm and secure construction, and is admirably adapted for borders and for lawns of no great extent.

ALEXANDER SHANKS and SON also respectfully solicit notice to "Fleming's Weeding or Salting Machine" for destroying weeds in gravel walks, court-yards, drives, &c. This machine is now in operation in many parts of England, where it has given ample satisfaction as the best and most economical means of thoroughly keeping down weeds or Moss

Further particulars with testimonials and prices, may be had on application.

PATENT LAWN OR DAISY RAKE, the invention of and registered by Sir THOMAS F. F. BOUGHEY, Bart. The novelty consists in the form of the teeth, which, being parallel to each other, do not, like those upon the old principle, so soon become clogged up and useless.

One of these improved Rakes will do the work of five on the old construction, and are offered to Horticulturists as one of the most useful inventions of the day.

Sold wholesale by the London, Birmingham, Wolverhampton, and Sheffield Factors; retail by all respectable Ironmongers and Seedsmen in the Kingdom. Sole Manufacturer, W. S. UNDERHILL, Implement Works, Newport, Salop.

J. P. HAWKINS, Agent, Birmingham.

WATERPROOF PATHS.
BARN AND CATTLE SHED FLOORS.

THOSE who would enjoy their Gardens during the winter months should construct their walks of PORTLAND CEMENT CONCRETE, which are formed thus:—Screen the gravel of which the path is at present made from the loam which is mixed with it, and to every part of clean gravel add one of sharp river sand. To five parts of such equal mixture add one of Portland Cement, and incorporate the whole well in the dry state before applying the water. It may then be laid on 2 inches thick. Any labourer can mix and spread it. No tool is required beyond the spade, and in 48 hours it becomes as hard as a rock. Vegetation cannot grow through or upon it, and it resists the action of the severest frost. It is necessary, as water does not soak through it, to give a fall from the middle of the path towards the sides.

The same preparation makes first-rate paving for BARNS, CATTLE-SHEDS, FARM-YARDS, and all other situations where a clean, hard bottom is a desideratum. May be laid in winter equally well as in summer.

Manufacturers of the Cement, J. B. WHITE & BROTHERS, Milbank Street, Westminster.

TO THE TRADE.—*The Subscribers can supply the following* AGRICULTURAL SEEDS *to the Trade. Prices on application.*

White Belgian Carrot.
Yellow Globe Mangold Wurzel.
Long Red " "
Skirving's Swede Turnip.
Rendle's " "
True Devon Evergreen Grass.

Apply to WILLIAM E. RENDLE & CO., Seed Merchants Plymouth.

GRASS SEEDS.—CARRIAGE FREE.

PERMANENT PASTURE GRASS.—*The very best Selections can be obtained from* WILLIAM E. RENDLE & Co., *Seed Merchants, Plymouth,—all new and carefully selected, from 24s. to 30s. per acre.*

ORNAMENTAL LAWNS, PLEASURE GROUNDS, &c. The choicest varieties for producing a fine sward for Lawns and Pleasure Grounds can be procured from WILLIAM E. RENDLE & Co., Seed Merchants, Plymouth, at 18s. per bushel, 2s. 6d. per gallon, or 1s. per lb.

RENOVATING GRASSES—for sowing over land deficient of plant—can be obtained at 9s. per lb.

A complete descriptive List of Grasses will be found in "RENDLE'S FARMING PRICE CURRENT," *and some valuable Tables, and other information relative to the best varieties for certain Lands and Situations.*

Apply to WM. E. RENDLE & Co., Seed Merchants, Plymouth.

ESTABLISHED SEVENTY YEARS.

SUTTON'S PERMANENT GRASS SEEDS, Price 24s. to 30s. per Acre.—Gentlemen intending to lay down Land to Permanent Pasture, or for one, two, or three years' lay, are recommended to communicate with us, stating the nature of the soil and situation, that we may advise as to sorts of Grass Seeds most suitable. Having had many years' experience in laying down Land to Permanent Pasture in almost every part of the kingdom, we can confidently undertake to supply the sorts of Seeds best adapted to the land to be laid down.

Clovers and Grasses for one, two, or three years' lay, 12s., 16s., and 22s. per acre.

A Priced List of Mangold Wurzel, Turnips, and other Agricultural Seeds may be had, post free, on application, addressed JOHN SUTTON & SONS, Seed Growers, Reading, Berks.

The Agricultural Gazette.

SATURDAY, APRIL 28, 1855.

MEETINGS FOR THE ENSUING WEEK.

WEDNESDAY, May 2—Agricultural Society of England.

WE learn from Messrs. RENDLE, of Plymouth, that in consequence of the unheard-of demand this year for Italian Rye-grass there is not a bale of foreign seed in all the trade. No doubt seed of the

coming harvest will be imported in large quantities before our own corn harvest is completed, and before therefore the autumn seed-time of this plant, but the exhaustion of the supply at present speaks plainly of the estimation in which the crop is held; and we doubt not that the extent of next year's crop will be vastly greater than the seed had hitherto; large quantities will, however, arrive in autumn, both by itself and as mixture with trifolium incarnatum.

It is a singular fact, but not more singular than true, that the very first step in the Science of Matter is a step into the invisible world! How nearly extremes meet—how closely the simplest rudiment of the most *material* knowledge borders upon the most occult philosophy, is a reflection that in some shape or other finds access into the mind of the very beginner in the great field of chemistry, and never can desert him again during the whole progress of his studies. He takes up a lump of soil, or a piece of metal, or a glass of water, or, if you please, a dose of 'physic,' and says "Teach me what these things be; unriddle me the history of Matter. I see it around me in every shape, colour, and consistency. I learn by degrees something of its uses, through practice; and I see that it has certain *relations*, one thing with another; that heat turns solids into liquids and liquids into gases; and that cold on the other hand congeals them again. I see that vegetables are green when exposed to the daylight, and are blanched by darkness: I see that animals must have air, to breathe, and fire must have air, to burn; I see that coach-wheels commit spontaneous combustion if they are not greased. Tell me something about all this, that I may *understand* as well as see it: what are these substances, and what are the laws, if any, which govern them."

It is true, people do *not* ask these questions, else, all men would become 'chemists.' Nay there are human skulls that do not pick up factology enough in the drama of existence for the very prologue to some of the queries we have hazarded. Certain captains of emigrant ships we wot of who never knew that air was an essential to human life under the battened-down hatches of a crowded cabin; housemaids are proverbial unbelievers in the necessity of air to the laying, lighting, and burning of a fire; and the 'King of Bantam' was a stout infidel to the last, in the matter of ice, since in his climate, wherever that was, water never froze.

But, such notable exceptions apart, no sooner, we repeat, does the inquirer into the history of Matter open the first rudimentary page of reply to his "questioning of visible outward things," than he finds himself at once launched into the *invisible* world, as the only interpreter of the visible, and discovers that his

"eyes are made the fools o' the other senses,"

which he has been accustomed to think "worth all the rest." It is called, and justly, one of the noblest of sights to see the weighty structure of a ship whose solid ribs have consumed the heart-of-oak of some 50 acres of forest-land in the building, glide for the first time down the slips that launch her upon the breast of a new element, where she floats at once in graceful buoyancy, finding in an instant her native home in a quarter the most foreign to her growth and nurture. But not less truly beautiful is the first awakening and *emancipation* of the mind from the slavery of mere eye-sight, into the inner world and history of Matter which chemistry at once begins to unfold. To omit one or two of what may be called the governing elements of Nature which meet the student at the threshold, and to which we have already made allusion, such as Light, and Heat, let us go on to certain other of those *invisible* gentry that claim his earliest acquaintance—namely, the constituents of the atmosphere he has been, almost unconsciously, breathing from the moment of his birth, and employing as an unpaid agent and workman in every field he has tilled and every crop he has grown.

But how vexatious, at the very outset, is the old pedantry of Science! What an inheritance of evil is it that our teeth should be set on edge by the sour grapes our fathers have been chewing, in the names they have given to the very commonest of elements. We remember a worthy and simple-minded clergyman who on inquiring the name by which he should christen the firstborn son of two of his poorer parishioners was somewhat staggered, at the font, by the reply, in a grave sponsorial tone, of the name *Venus!* but being a man of presence of mind and decision he summarily dealt with the case by saying after the thought of an instant, "Nonsense! *John:* I shall baptize him 'John'!" Every practical farmer must wish that that gentleman had presided at the Font of chemistry; for it baulks the very first hopes of a simple narrator of the simplest truths of Nature to be reduced to the bitter confession that every time a man draws his breath he is liable to be choked by such a compound as imagination must attribute to the words Oxygen, Nitrogen, and Carbonic-acid gas! Yet the humiliating fact is literally incapable of statement in shorter or less dangerous terms. We say 'dangerous', in deference to a prejudice: not that we actually believe the stories; but there are those among the foes of science who *will* have it that authentic cases of lock-jaw have occurred from too rapid and ambitious a progress in chemical nomenclature.

But, seriously and truly, is it not a misfortune that the instant you try to *simplify* Nature to a man, (for the object of all *learning* is, surely, to simplify something which was difficult before; not to make it harder;—else, what does knowledge mean?)—that you are *obliged* to begin bowling such skew balls as these! *Oxygen, Nitrogen, Carbonic-acid!* Why, if the theory of Lucretius be true that sounds produce their effect upon the drum of the human ear by virtue of infinitely small but solid atoms, smooth and round in the case of pleasant noises, angular jagged and even barbed in the case of harsh ones; this very first lesson in chemistry must, upon poor Dobson's auditory faculties, have pretty much the effect of a sudden explosion of pins and needles and fish-hooks!

How is he to know by inspiration that Oxygen in plain English signifies 'acid-maker,' or in more expressive Yankee—'Sort o' Sour,' and that it discolors the leaves in autumn, 'making the green one red,' and that this same *red* is in fact its *livery* colour, as he may also see upon any piece of steel or iron exposed to air or moisture, or still more strikingly in the color of the blood of all things which *breathe;* that act of breathing being the inhaling of this oxygen into the lungs, which have the faculty of separating and absorbing it from the air, or, in the case of fishes, from water, which contains it in greater quantity than air does. And how, again, is he to know what 'Carbon' means, unless you can somehow convey to him that it indicates the solid and weight-giving property of wood and coal and charcoal, and other such substances, that its 'livery' colour is dark blue, approaching to black; that whenever it meets with the aforesaid oxygen, especially in the presence of warmth, they begin to fight *consumedly*, and go on fighting, till like the Kilkenny cats, they have eaten each other up; that if the fight be short and violent it produces fire and flame, and is called 'Combustion;' if long and slow, men call it 'Decay.' That the result in either case is a compound substance called Carbonic-acid gas, which, though invisible like one of its parents, retains the obesity of the other, being so heavy that it can be poured out of a tumbler, like water.

So much for 'Oxygen' and 'Carbon;' two substances so common and plentiful, that if a person should happen to say that one-half the world is oxygen and a good proportion of the other half carbon, he would not be very far wrong though not quite right.

And now for the other hard word 'Nitrogen.' Whoever can 'do the like' for this gentleman, 'he is the nonpareil'! And let it not be thought that we have awarded him the title of gentility in vain: for, mystic doubts, not based on mere conjecture, have at times crossed great and learned minds whether he is really one of the '*simples*' of Nature he is held out to be. His lazy exclusiveness, and reluctance to enter into society with other plain bodies, his ancient pedigree, (for he was known by name to the Egyptians, Greeks, and Romans, and dates high enough to be the progenitor of Alchemy and Magic,) his curiously fastidious costliness and inaccessibility, so near to you in person, of such gracious and bountiful-seeming presence, yet so hard to *get at*, and last, not least, a certain obscure and baffling relationship he appears to enjoy with the very Thunder and Lightning, entering capriciously into odd combinations thereanent, generative of quasi-metallic, or, as an ignoramus might say, *silico-metallic* results, (and here we may beg pardon of the Herald's College, for putting a metal upon a metal, —an illustrious error, that first detected the 'Author of Waverley')—all this, and a great deal more which would only get more intolerable as it went on,—marks this 'gentle or simple,' whichever it may be, as worthy our especial notice and study, if it be only for the attractive reason that so many people talk so much, and know so little about it. It is a sort of chemical Sphynx; and 'happy man be his dole' who can act Œdipus to the riddles it propounds to us, the *vital* importance of which we shall presently see.

But first of all, there is one more character we have to introduce, and then we have done for the present with 'proper names';—improper enough, if the mischief they have done to the advance of common sense and common knowledge of common things, be rightly considered: but the truth is that Chemistry (itself a word more thoroughly bad than any it embraces, being of such questionable and far-fetched origin that for all useful purpose it might just as well have no origin, and mean nothing at all)—the truth is that Chemistry is a base-born science that dates its early growth in the blackest darkness of pretentious ignorance, and to this day it has *never* recovered the early taint of its pedantic birth. The exquisite beauty, and charming simplicity, of the knowledge it really unfolds is *the reason* why it has been swathed and swaddled in the folds of mystery and complexity; because it is the nature of man to turn just such knowledge into a 'property,' and to

——"sit like a Cormorant thus
Hard by the tree of knowledge"—

whose fruit he pretends to dispense. *Corruptio optimi est pessima;* which being rather inverted than interpreted, may furnish the remark that the most beautiful things are the things which man has most disfigured.

And so we come, by a very roundabout road, to our fourth long name, which is 'Hydrogen': a word not simpler sounding than its three predecessors, but of much simpler meaning than the last, suggesting simply the idea of Water, which it is not, but which it forms in union with Oxygen, as Air is composed of the latter with Nitrogen: but with a most important difference in the *mode of union*, too important to enter upon at present.

For, the aim and object of our remarks, delayed by this uneasy effort to lift, or penetrate, the fog that scares away so many a goodly simple mind from the study of the properties and relations of Matter (the true and only purport of what we call Chemistry) is to attempt an explanation, intelligible to minds that can understand simple facts when the dust and cobwebs of long words are brushed off them,—of the intercourse that exists between the Air we breathe and the soil we cultivate.

It is an intercourse so immeasurably important to the growth of crops, and it happens to be at the present time the battle-ground of so important a conflict of opinions between great men in England, and great men in Germany, that it is worth knowing something about, if it be only for the fun of watching the fight, and understanding the fight we watch. Besides that, however excellent the crops a man may grow without knowing 'the reason why,' it is open to all who have brains to fill, as well as pockets, to discover that with much less trouble than he thinks, he may add to the pleasure of getting, the happiness of knowing. *H.*

The sale at Hendon on Tuesday last will prove to have been one of the marked days in the history of the short-horn breed. One hundred head of cattle sold for 7447 guineas, averaging 78*l.* 3*s.* 10*d.* each. Seventy-six cows, heifers, and calves sold for 5610 guineas, averaging 73*l.* 7*s.* each; and of these 24 were under 12 months old. Twenty-four bulls and calves sold for 1837 guineas, averaging 76*l.* 11*s.* 3*d.* each, and of these 19 were under one year old.

But the prices reached in particular instances are even more extraordinary than the averages, as will be seen in the list of prices appended to this notice. Oxford 11th, purchased by Mr. Tanqueray at Lord Ducie's sale for 250 guineas, was here bought by Mr. Gunter for 525 guineas. Oxford 16th, sold a calf of a few weeks old at Lord Ducie's sale for 180 guineas, was here sold for 480 guineas. And among the bulls the sixth Duke of Oxford, now a yearling, was purchased by Mr. Gunter for 200 guineas. His dam, Oxford 11th, and himself sold for 725 guineas, she having been bought in calf at Lord Ducie's sale for about one-third that sum—an enormous price as it was then thought, but one which the sale on Tuesday of herself and her produce has certainly more than justified. The competition for this family of short-horns which has led to these extraordinary prices lay chiefly between Mr. Gunter and Messrs. Becar and Morriss, of New York. Mr. Gunter is now the owner of more of the two fashionable short-horn races—the Duchesses and Oxfords—than any other breeder in the country; and though they have been acquired at enormous prices, they will doubtless at any time repay their cost, while American and English judgment unite in attributing to them the high qualities which they undoubtedly possess. The Americans carried off Minerva 2d and Minerva 4th, at 140 guineas each; also Victoria, at 16[illegible] guineas; Surprise, at 80 guineas; Delia, at 6[illegible] guineas, among the cows and heifers. They did not purchase among the bulls. The highest priced bull, Duke of Cambridge, was purchased by Sir C. Knightley for 280 guineas. The seventh Duke of Oxford, which has been expected

to realise the highest price, was dead. We refer for further particulars to the price list below.

The day was clear and bright: Mr. STRAFFORD had a very large audience; and both he and Mr. TANNERAY have, we think, reason to congratulate themselves on the result of the proceedings.

Of the sales at Halifax and Lancaster, also conducted during the past week by Mr. STRAFFORD, we shall be unable to give a report until next week, when reference will be made to the prices reached, and to the way in which connection with the Kirkleavington herd at once raises the market value of the animals sold. There is undoubtedly a real superiority at the bottom of the extraordinary excess in price reached by particular families of the short-horn breed; whether the latter may not be partly owing to temporary fashion, time alone can prove. When a breeder shall, by long success, independent practice, and self-confidence, attain the reputation of the late Mr. BATES, *his* stock, too, will doubtless acquire a market value perhaps higher than its actual merit.

EXPERIENCES IN LAND DRAINAGE.

No. I. MALTON, YORKSHIRE.—We like to get our drains 4 feet deep if we can get an outfall, but we can only get from 30 to 36 inches in some places: we then put the drains 12 yards apart—where we can get 4 feet we put them 22 yards. Both distances answer perfectly well; indeed we can see no difference—both are equally dry alike, and we have now no difficulty in feeding off the Turnips with sheep, where, before it was drained, you went down every foot you set down as deep as the plough. This land is not more than 50 feet above the sea level; soil alluvial, from 6 to 15 inches deep, lying on gravel and sand to I do not know what depth—we have bored 30 feet and still find nothing but gravel and sand intermixed with "jet." The land is nearly perfectly level, and the spirit level is constantly in use. All gutters are filled up. Our Grass land we drain 4 feet deep, same soil and subsoil as above, but we put our drains 40 yards distant, which answers well. We have drained about 600 acres. We have used 1½-inch pipes; neither collars or sockets are used. We cover the pipes from 4 to 6 inches with our *best soil;* this acts as a filter, and the tiles never discharge either gravel or sand. For main drains for 10 acres we use 3-inch pipes, for 20 acres 4-inch pipes, and for 30 acres 5-inch pipes, which we find quite large enough. We have had only one failure on a piece of land about 2 acres; this is 620 feet above the sea level at the edge of moorland, the moor rises at an angle of about 40° [?] to the height of 400 feet; it is sandstone to that depth, then sandstone rubble. The water comes out here and contains so much carbonate of lime that the pipes in three years are completely choked up, and carbonate of lime is deposited in some places to an unknown depth. On our clay, of which we have very little, we drain 4 feet deep, 21 feet apart, using the same sized tiles; this has also answered well. We have not more than 100 acres of this kind of soil. Under the clay, which is a great thickness, there is a bed of limestone gravel to what depth I do not know. The rest of the estate is perfectly dry, principally resting on the greystone rock and the oolite limestone. *Thomas Hornsey, agent to E. S. Cayley, Esq., M.P., Malton, Yorkshire.*

No. II. GATESHEAD.—The drains have been all placed parallel to each other, but their directions vary with the different inclinations of the field. The prevailing depth of drains is 4 feet, the main drains varying from 4½ feet to whatever depth is necessary to ensure a good delivery for the drains; in some cases I have cut them from 10 to 14 feet in depth. No difference has been made between grass and arable land. I invariably set out the minor or branch drains to face the quickest descent, so that the bottoms of the drains rest on nearly the same plane, and the water is thus conveyed quickly to the main drain, and so to the outlet. I never drain across the fall of the land, the drains would require to be much closer; otherwise the water would flow under the higher drain and reach the surface before being caught by the other drain. I do not pay any attention to furrows: where they answer, well and good, but on light lands you find the ridges across or inclining to the slope or fall of the land, to check any wash by heavy rains or thunder-storms. I have used 2-inch pipes for minor drains, 3-inch, 4-inch, 5-inch, 6-inch for main drains, in proportion to the quantity of rain falling into them. Where there is a large quantity of land delivering at one outlet, I sometimes use two pipes, thus OO, size and proportion according to land; I use well-jointed pipes without collars, and when properly done I have never found them to stop. I have never tried giving access for air to the drains. The soil on this estate is light, subsoil varying, gravel, sand, sandy clay, strong clay mixed with stone, generally having dry backs or bands, like "cat band," or "moor band pan" across the immediate descent, like so many dams to the water in the subsoil. I have sometimes known these to occur within 10 yards of each other. The geological formation is the coal measures. I have now been engaged in works of drainage for some years and to a considerable extent; at present I have under my superintendence the drainage of this the Gibside estate, the property of John Bowes, Esq., for which 5000*l.* is now being laid out under the private money drainage act. On my first becoming acquainted with draining, shallow draining in the furrows was all the practice, but like many others, by practice and the able papers published by Mr. Parkes, the engineer of the Royal Agricultural Society, and others, I was led to see the advantage of deeper draining—say 4 feet—over the shallower 2 feet, since which time I have adopted a uniform system of drainage of 4 feet for branch or minor drains, varying them in width according to the subsoil, as it was more or less retentive, it being the best and cheapest form in which draining can be executed, combining utility, economy, and durability, its utility being that you can place it further apart, thus lessening the cost of tiles and leading where the tile kilns are distant. The drains being at such a depth are out of the reach of injury, yet not too deep but that they can be easily repaired, &c. The distance at which I place the 4 feet drains apart is on an average about 36 feet, the subsoil, as I have before stated, being open and porous; this distance answers well, the main drains vary in depth, so as to ensure a good outfall, which I make a point of first importance, but in all cases ensuring the branch drain a fall of 6 inches into the main drain. Before commencing to cut the main drains or outlets, I have the ground accurately levelled, using Cook's York level, which I find simple and accurate, thus saving any unnecessary cutting or having to go back for fresh level, thus lessening cost. I never use a larger tile than necessary for the main drain; in some fields I use 3-inch main tiles, 4-inch, 5-inch, and 6-inch, in proportion to the volume of water to be delivered, which, if consistent with economy, I bring together to one outlet. The fewer outlets the better, being less liable to be neglected or overlooked. The cutting of the drains is set at so much per rod: an active intelligent man is employed as tile-layer, who sees that all drains are properly cut, of a proper depth, and level at the bottom, with not more width than the tile will fill; the cutter fills in immediately the tile is laid. We find the tiles and all materials required, the superintendence, and every other cost connected therewith, reach an average cost per acre of 5*l.* 2*s.* 6*d.*, having expended up to the present time nearly 3000*l.* On strong clay soils this (width apart) will not answer; in some districts you will find the ridges laid out 18 feet to 24 feet in width, the centre of the ridge being nearly 3 feet higher than the furrow (this is where the land is very flat), the furrow being curved between one end of the field and the other. On such land I have drained 2½ feet to 3½ feet in depth with good results. Great errors have been committed on such land after draining by attempting to level it; in doing so the productive soil or surface of the field was buried in the furrows, and the benefit of draining neutralised. *John Dent, Gibside, Gateshead.*

ON FARM ACCOUNTS.

[At a late Council Meeting of the Royal Agricultural Improvement Society of Ireland a paper on this subject was read by Mr. Hamilton, from which we make the following extracts.]

The day-books are—

1st, *The Steward's Cash-book,* in which he enters, every day, the charge of sums of money received, and the discharge of sums expended, and sees that his balance is correct.

2d, *The Labourers' Account-book.*—This is larger than the usual one, so as to enable the steward to enter, opposite the name of the workman, or horse, what heading the work that they have done is to be posted under; on the opposite side of the book is an arrangement of ruling by which, at the end of the week, there is a space for posting the work done and the cost, under the separate headings contained in the index. Thomas Gannon is entered as three days ploughing, three days carting Turnips, at 1*s.* 2*d.* per diem; the two horses at 4*s.* per diem, and one horse at 2*s.*, are carried out under the headings of

Turnips.	s.	d.	Preparation of land for Oats.	s.	d.
Manual labour	3	6	Manual labour	3	6
Horse labour	6	0	Horse labour	12	0
	9	6		15	6

When the steward has made these entries, which are merely the points which he must know, if he knows anything of how he is expending his master's money, there can be no more complication, and either he, or any good clerk, can post the information so conveyed into the farm-account book under the proper headings.

Mr. Hamilton proceeds as follows:—

3d, I have lately printed a small sheet of letter paper, so ruled, that the steward can, with the greatest ease, fill in every particular of the amount of stock, the food which each class consumes, the cash account, and the register of farming operations; and also a dairy return, of which I lay specimens on the table. These returns are all that are necessary for the steward to furnish; and wherever the establishment is so large as to justify the keeping of a clerk of the yard, whose business it is to see all quantities measured, and given out, and to post the steward's returns into the farm-account book; or where, in smaller establishments, the posting is done by a professional accountant periodically, or the farmer himself, the constant check upon unintentional errors, from having the returns furnished by one, and posted by another, is invaluable, and leads to a wholesome rivalship in accuracy. Having now described the groundwork, I shall proceed to attempt as clear a description as I can give, in general terms, of the Earl of Meath's account-books. The headings comprised in the index are arranged thus, under two distinct classes:—

Farm Account.—Work-horses, milch cows, cattle fattening, store cattle, sheep, swine, poultry, dairy, Wheat, Oats, Barley, Bere, Beans and Peas, Flax, hay, stock, stackyard, Potatoes, Turnips, Mangold Wurzel, Carrots, Parsnip, Vetches, Rape, Rye for soiling, cut Grass, pasturage, roads and yards, fences, drainage, farm-buildings, implements, miscellaneous stock, miscellaneous crops, miscellaneous unraised accounts, bills paid and to be allocated, storeroom, balance sheet; farm-accounts showing the produce of each field, memorandum of stock pasture-fed, memorandum of stock house-fed, memorandum of breeding stock, journal of operations, and general memoranda.

Mansion and Demesne Account.—Carriage and riding horses, mansion, garden, pleasure grounds, woods and plantations, roads, fences, game, cottages, miscellaneous.

The first class comprises all accounts which come under the legitimate heading of farm-account, and the profit on which is to be set against the capital expended by the owner. Under the head of work-horses, there are columns for Oats, Barley, Beans, hay, straw, Potatoes, Parsnips, Carrots, other food produce of the farm, food from the storeroom, or purchased food, price, manual labour, horse labour, other expenditure, total cost. Under these headings are posted merely the figures,

denoting quantities from the steward's weekly returns; the credit side will show the number of days worked during the year; and the total of expense, together with an allowance for wear and tear, divided by that number, gives, at once, the cost per diem of each horse's work, and so checks the arbitrary charge of 1*s.* 6*d.*, 2*s.*, or 7*s.* 6*d.*, usually made. When calculating the cost of farming operations under the next head, milch cows, we have the columns for number, description, age, when, where, and how obtained, folio (this leads the eye, at once, to the account of store cattle, or any other from which they may have been transferred), cost price, live weight, measurement, pasture-fed, as per folio, class; expense of pasture-feeding, house-fed, as per folio, class; expense of house-feeding, cost of attendance, other expenditure, total. The reference to the folio and class is to the memorandum of stock, pasture or house-fed, where any charge is recorded, such as 8 dairy cows, in field No. 2, from May 1 to November 1; from November 1 to May 1 in house, getting 4 stone Mangold Wurzel, 14 lbs. hay, 3 lbs. oil-cake, per diem. This simple record of each change, with the date, makes it an easy calculation, at the end of the year, to give the cost of the cows' feeding. The contra side is arranged under columns —produce, in dairy, average quantity of milk, value, stock, description, value, when, where, and how disposed of, live weight, measurement, price obtained, profit, loss. The dairy account has, on the Dr. side, the number of cows, average supply of milk, value, total—on the contra side, the value of dairy produce disposed of, as cheese, butter, cream, new-milk, skim-milk, butter-milk, when, where, and how disposed of, value total. This is only a posting in of the summary of the sheet filled in by the dairymaid or housekeeper weekly.

We now take one of the crop accounts as an example, and let us begin with Wheat; at the upper part of the left-hand page you will find a place for the name of the field or fields, and the contents; the columns are —manual labour, horses' labour, other expenditure, and total cost of crop of 18 ; same repeated for crop of 18 ; so that each year's crop may be followed out as to the completion of expense and returns into the markets of the succeeding year. The columns on the contra side are—By carried to stackyard account, folio, No. of stacks, cubic yards, estimated value per cubic yard, total estimated value—By value of Wheat distributed as per stack yard account, folio, total. There are two accounts ancillary to those crop accounts, which provide against any confusion. It often happens that the preliminary operations upon which the success of the crop depends—such as autumn ploughing, cleaning, &c.—are performed before it is quite certain whether the season, or convenience of the owner, may lead him to use Wheat, Oats, or Barley; until this is a matter of certainty, the cost of those operations on each field are posted in the unraised account, and when the decision is come to, the first entry in the Wheat or other account will be—to manual and horse labour, and other expenditure from the unraised account; the account is then carried on regularly under its own heading. When once the corn is carried from the field, the farmer enters his calculation of the supposed value of his crop, in order to know the probability of the amount of food and straw that it contains; but this calculation is checked by the certainty of the produce of the stack-yard, where, according as any stack is threshed, the entries of disposal are made under the headings of Wheat and straw, &c.—as stack No. 1, threshed such a day, so many barrels sent to market, so much small corn transferred to poultry account, so much straw sent to the coach-horse stable, so much to the store cattle, &c.; thus we follow each stack and the contents of each field out, until we know exactly what the produce in corn and straw has been.

I shall now take one example of a green crop—Turnips. The left or Dr. side is exactly the same as that of Wheat; on the contra the columns are—quantity sold, given to horses, milch cows, store cattle, fat cattle, sheep, swine, miscellaneous, mansion, total quantity disposed of, value per ton, folio, total. These entries being made weekly, the farmer at the end of the year knows, at one glance, exactly what his Turnip crop has cost him, dividing the number of tons into that cost he gets the cost of each ton; if he adds the rent and interest of money he knows at what price he can supply his cattle with Turnips; and by charging them at that rate, and not a fictitious value, he has one element in the calculation of the cost of house-feeding provided for, the others follow out of these separate accounts as readily.

I need not enter into any detail as to the other accounts, they are all headed so that the Dr. and Cr. sides contain provision for every possible contingency of expenditure upon raising the crop, or allocation of the produce; and all this is obtained without learning the art of the accountant, but only fidelity in entering each transaction at once in its proper place; the tabulation requires no thought, it comes out of itself at the end of the year or half-year. There are six balance-sheets, so as to enable the farmer at any time to make out his accounts, and see how he stands; and this is done simply by striking the balance on each account, and entering the Dr. and Cr. in the balance-sheet. On the debtor side is charged in addition, rent, taxes, and interest, &c.; on the credit side, the value of stock in hands; here a great advantage is gained by the entry of the real value instead of a fanciful one.

And now I recur to the weekly returns, which are the foundation of this minute system of accounts If every act of buying, selling, horse and manual labour, division of produce into the various channels of ordinary consumption on the farm, &c., is noted down at the close of day by the steward faithfully, and classified, at the end of the week, under the very few headings which any one week's work would embrace, there is no longer any danger of confusion—every item falls into its proper place, and the cost of every simple transaction can be at once referred to. I believe that every year the necessity of accuracy in farm accounts will be more felt, and that agriculturists will owe much to the Earl of Meath for having entered on so expensive an undertaking, which, until the public see its importance, would not have found any publishing speculator willing to embark in. Seventy copies were printed, with a view that those most anxious on the subject might have them at a cost of printing, keep them for a year, and then report upon any apparent improvement, so that a future edition might be made quite perfect; several have been kept for above six months, and seem to work as well as possible. [We believe most readers of the above will, after mastering the plan so far as that is possible from a description, agree with us that we still want a simple and efficient system of farm accounts, adapted for ordinary and general use.]

ON REFORMATORY SCHOOLS.

BY T. BARWICK LLOYD BAKER, ESQ.

[The following are extracts from a paper read at the meeting of the British Association at Liverpool.]

THERE is one point to be most zealously watched and guarded against, namely, that we do not allow the warm interest we take in the criminals under our care—or our own natural vanity in turning them out as creditably to ourselves as may be—to induce us to give them superior advantages, and thus make them an object of envy to the innocent.

It must always be difficult to avoid this. We are all prone—the educated more than the uneducated—to think others better off than ourselves: but if there were once raised a general feeling that admission to a school of this kind were a thing to be desired, we should, I fear, have done a positive evil to the many which would outweigh whatever benefits we would give to the few. The deductions from these considerations (whether faulty or not may be a matter of opinion) have led us to adopt our present system. We hope—and so far as we can see, we are borne out in our hope—that the world without—the legally honest—will see little to desire in the system which separates a child from his parents for from two to five years, giving, by the new act, power to put all the machinery of the Poor Law Acts in force to compel the parent to pay all he can towards the support of the child; while the boy himself is set to steady hard work, which will fit him to become, not a proficient in one of the more skilled trades, which are an object of envy to those of the lower classes, but simply a tiller of the soil—a farm-labourer. It is true that we endeavour to make our boys as good farm-labourers as possible. It is true that a good farm-labourer is, we believe, in a really better condition than most artificers. It is true that if his wages are lower, his rent and other expenses are lower in proportion, and that both his temptations to evil and his chance of being thrown out of work are less than they would probably be in any other course of life. Yet still the general feeling is, and probably will be for many years to come, all in favour of the occupation of the tradesmen.

All this appears to point out agricultural employment as the kind peculiarly adapted to institutions whose aim is to unite real advantages to the boy, with the absence of all which may appear even to the ignorant to make the effects of crime desirable. But there are yet other advantages which are quite as important. The mind of a boy fresh from the excitements and passions of the streets of a town—the alternate crime and idleness —the lavish expenditure when lucky, and the cold want when unsuccessful—is in a state of feverish restlessness, which requires to be allayed before it can safely be operated upon. Now, I know of no employment which will allay the excitement and tranquillise the mind, so as to prepare it to be acted upon by a firm kindness, like steady, hard digging. . . . . Now this is one point in which lies, as I think, the great value of agricultural employment. A boy comes to us, usually quick and energetic by nature (for unless he be so he is not likely to have distinguished himself in evil), and with a restless craving for change and excitement caused by long-continued vagabond and lawless habits. Set him at once to tailoring or shoemaking, and while he feels an apparent confinement of his body within four walls, his mind has full liberty to return in imagination to former scenes of excitement. But, on the other hand, put him to hard and unused bodily exertion; his energy expends itself, not only harmlessly but profitably, on the stiff clay; the very feel of the fresh air and the appearance of liberty tend to tranquillise and allay the feverish excitement, and when the labour of the day is over he is disposed rather to enjoy his rest in his new career than to revert to his former courses. He may probably indeed be disgusted at first with the hard work; not unfrequently he declares that he'll run away soon; but the very absence of walls and apparent restraint incline him to put off his intention till by degrees he finds, not only that the bailiff is nearly always in sight, but that even most of the boys would prevent his elopement (for the boys by no means like runaways); and, seeing those around him contented and patient, he finds that a life of labour and regular habits is on the whole more to be desired than the excitement of lawlessness. The kindness, too, with which they are treated—for the bailiff is, and must be, kind and gentle in his manner, though thoroughly firm—and the discovery which they make ere long—though they are slow to believe it at first—that the managers are doing their work not for pay but for love, all tend to soften and subdue the rugged and hardened tempers and to bring them into a state to profit by instruction.

Here also we find a great advantage in farm labour. The greater part of the boys come from towns, and if we taught them trades, to towns they must return. True, we should probably endeavour to place them in other towns than those from which they came; yet still, to a boy used to the vices of the streets, a large town will always have great temptation. Now, if we place him with a farmer in the country, all his habits, all the objects he sees, remind him of his school life where he has been reformed, rather than of his former evil courses, and the broken thread is not likely to be renewed.

We do not either entirely close the door to some light trades. The boys make their own clothes and mend their own shoes very tolerably. They make baskets also in wet weather for the use of the farm, and some few for sale. But this is merely done with the hope that in their future farm service they may be able to employ a wet day or a winter evening more profitably to themselves, their fellow-servants, or their master, than they would otherwise be enabled to do.

I do not come here to talk of my friend and myself, but perhaps you will allow me in a very few words to sketch the history of our own school. About 20 years ago I became acquainted with the two persons who I believe may be considered as the originators, in our country at least, of this movement, namely, Miss Murray and Capt. Brenton. Their views at first appeared to me to be grand but wild; and it was not till I had some years' experience as a visiting magistrate of a large prison that I became convinced of the truth of their opinions, which my later experience has still more confirmed. For many years I longed in vain to see the experiment tried again; till some three years ago (having casually mentioned the subject to him a year or so before) Mr. Bengough offered to join me in the undertaking. Several of the leading magistrates of the county gave us their support, advice, and assistance, but the management remained solely in our hands. I built very little more than a labourer's cottage in the middle of my own property on a small farm of poor land, which happened to be in my own hands because it was in too bad order to let, so that, had the experiment failed at any time, I might have given up the school, let the cottage to a labourer, and sustained no loss. We commenced thus in our inexperience, merely because it was the most convenient plan we could adopt; but our later experience has not shown us any way in which we could have improved it.

Now let me ask, is there any county in England in which there is not to be found a magistrate who wishes for such a school (if it be needed there), and who can find, at a fair rent, a few acres in the middle of his own property, and near his own house, where the experiment may be tried? I shall be told that a magistrate usually has not only the duties of that office but also the other business of a country gentleman to attend to, which leave him not time enough to establish such a school. I know perfectly well that this was my own case; had it been otherwise I should have attempted my favourite scheme long ago. But can the aforesaid magistrate not find some one like my friend Mr. Bengough—a young man who being heir to a good property, does not require a lucrative profession, and yet wishes for employment—who will help him? Numbers of such men now-a-days flock to chambers, and undertake the toil and drudgery of the law to keep them from idleness, and to prepare themselves to become useful country gentlemen in their day. And can none be found who, without giving up their fresh country air and exercise, without leaving altogether the engagements and pleasures of home, will give some three days a week for so extremely interesting and satisfactory, not to say so useful and honourable occupation, as the reforming the youth of a county?

I do not mean to say that Mr. Bengough did nothing uncommon. When he gallantly undertook the work, the chart was unknown—the perils, like all unknown things, were exaggerated. Many expected that he would be murdered, and that my henroost would be robbed. No one could say what difficulties we should have to encounter; and there were perhaps few men who would have had the pluck and perseverance to brave the unknown seas.

We have made it our object not to take all the boys we could, from whencesoever collected, but to endeavour as far as possible to clear our own county from the instigators and instructors in juvenile crime. Not because we hold those of other counties as aliens for whom we care not; but on the same principle that if I were to go all over the county pulling up a weed on every man's farm, I should do next to no good; there would be plenty left everywhere for seed. But if I pull up every weed in my own farm I do a real good to myself and my neighbours, by leaving none to go to seed; and thus I show my neighbours how they may benefit their own farms. The result, so far as we can yet see, has been satisfactory. In the town of Cheltenham, the largest in our county, and formerly the most productive in juvenile crime (though by no means dark in the statistics of general crime), there were reported to be by the police in January, 1852, about 20 boys under the age of 14 who had been once convicted, and about 20 more

who, under the same age, had been twice, or three, or four times convicted."

I believe that I can now say that there is not at present in Cheltenham more than one boy under 16 who has been twice convicted. An old farm-house will hold this number, and be infinitely better than new buildings, for the very reason that it looks more homely and plain. The more simple and unambitious your building can be, the less inducement will it hold out to the honest, and the better will it prepare the boys for the rough life and accommodation which they will afterwards find in a farm-house.

If it be necessary to build, let it be such a building as will in appearance resemble a row of labourers' cottages, and in fact will be convertible into labourers' cottages should circumstances make it desirable to change the locality of a school. I confess I believe that the moment you get a building which will strike the vulgar as ornamental, you to that degree commence a decided evil. Picturesque you may have it. An old half-timbered farm-house is a most pleasing object to the better educated. Our own school, with its plain red brick gables and its low tiled roof, will, when the creepers have got up the walls, be not an objectionable looking building to see on one's estate. But this excites no envy;—no feeling among the honest poor that "there is a grand place built for thieves, while I and my honest wife and children are forced to put up with a wretched cottage." I confess that, while wishing every success to the race of architects in all other ways, I trust that they may find as little employment as possible in designing reformatory schools.

With regard to the locality, I lay great stress and attribute much of the ease of our success to the fact of the school being placed in the middle of my own estate. Had a committee purchased a piece of land it would hardly have been possible to prevent all the neighbours taking fright at the colony of thieves established close to them; and an adverse feeling amongst the neighbours is a moral evil. For the same reason I would not have it near a village, as the less they see of their neighbours the better. At the same time I should much wish that it should be within a reasonable distance—a quarter or half a mile—of the church, as, if it be much further, weather may occasionally prevent their attending it; and a regular habit of church-going I believe to have an important effect on the future character.

These, and such like points, however, though I mention them as worthy of consideration, must vary with circumstances. But the principal points, I think, are, that the school should be rough looking, should begin very small at first, and increase very gradually, not laying down a rule at starting that you are to have a certain number in a certain time, but increasing just as fast as you find that you can get them well under discipline, and going to just such extent as you find suited to your convenience or the wants of your county; and thirdly, that it be managed by a country gentleman, and in the middle of his own property.

The quantity of land required we find to be about half an acre (of stiff clay) to a boy; but after it has been well dug for some years it will become lighter, and they can do more.

Our staff consists of Mr. Bengough and myself as managers. He lives 12 miles from the school; I about one. He comes and spends a few days with me now and then (alas! very rarely). I, when I have an hour or two to spare (very rarely also), go over and look at the boys working, and have a chat with one or another. I should think that I devote on an average four hours a week to looking on and chatting. Such are our arduous labours.

The bailiff is a farmer used to superintending workpeople, who does not treat the boys as a warder would do, according to strict rule, for any deviation from which he is liable to be complained of to the visiting magistrates, exacting a certain amount of work, and weighing out a certain amount of food; but he treats them exactly as experience has taught him to treat his own workpeople or his own children, exacting what labour he sees that each can do, and giving to each what food he finds to be necessary to keep him in hard-working condition. We certainly are fortunate in our bailiff. He has a mild gentle manner, with undeniable firmness. He will readily give us his opinion, which is usually worth having; but he will strictly obey our orders; and, above all, his heart is in it.

A great part of the ease of our success is perhaps to be attributed to our finding so good a bailiff. But in these days, when farming cannot be carried on without a large capital, there is many a man to be found with good plain education, good practical knowledge, and good feeling, but with too small a capital to farm.

The next person is the schoolmaster, and this I confess is a difficult office to fill. We can find many schoolmasters who will take the entire command of a school, and will cram their pupils, so as to gain the approbation of the most fastidious examiner. But to find a man who will teach for two hours and a half per day—so short a time that he will never be able to make them great scholars, fit to make a show of; who can in fact believe and feel that the converting the pests of society into good Christians is as useful and as honourable an occupation as that of giving ploughboys a correct knowledge of the position of the antarctic circle; who has in fact not merely a clever head but a good heart, and that heart in this work, is as yet a difficult person to find. Still I believe that ere long the demand will create a supply. Many a lad in our training schools is unable to pass the high examination required, and not obtaining a certificate of sufficient learning, is disqualified for taking charge of a national school. Yet many of these may have courage, coolness, discipline, and a heart in the right place, and though they have failed in their first intention, yet, in such a line as ours, they may possibly make not less useful, not less honoured men than others who have taken a first-class certificate.

In addition to the bailiff and schoolmaster we have also lately taken a labourer at 1s. per week above labourer's wages, to work and superintend one of the gangs. He in all probability will in fact cost us nothing, as he will earn his wages on the land, and with 36 boys with no fence round them, two superintendents are scarcely enough. Besides this we receive help kindly given us by many of our neighbours. Our vicar and his curate occasionally call in a class from the field, and give that instruction which a layman cannot give with the same authority.

In conclusion, I can only warmly congratulate those who take an interest in the matter, that the act of the last session, affecting young offenders, has placed the matter on such a footing that the Government allowance will, I think, be found sufficient to defray every expense of such a school beyond those of probably the first year; and I trust that ere long the wisdom of that act may be proved, not only by the mere increase of the number of schools, but by a decrease of general crime, remembering that our object is not so much to benefit the individual criminal as to benefit the children of the honest neighbour whom that criminal would corrupt.

Home Correspondence.

Parkes's Steel Digging Forks.—We would that all crops of corn, and more especially Wheat, were planted in rows about 2 feet apart or four rows on a stetch, commonly designated here 8ths, with at most only one quarter the usual quantity of seed per acre, in order for the admission and free use of a horse-hoe, or, what is perhaps better, a scarifier, as the horses would walk in the furrows, thus furnishing an opportunity of cleansing the crops from weeds (a point most essential, though too much overlooked by us all), and attaining to something like perfect cultivation of the soil—important for all grain crops, as well as green, and which the plough is not capable of accomplishing, and which cannot be effected by the process of manual labour with the common hoe, especially on what are termed full crops, or what we call "too thick seeding." But what is to become of the labourers at this season of the year may be asked, if such appliances as these are to be resorted to in lieu of the ordinary hoe? A similar question has been asked by a correspondent in reference to the use of steam threshing machines, &c. In reply we beg to name a salve for all those sores, viz., "Buy each of them one of Parkes's steel digging forks." Ply the use of it by forking up a sound spit between each row of corn, at all seasonable times from the end of September to the middle of April, by which times all kinds of grain should have made their appearance above ground. Labourers ought not, nor need stand still for want of employment, nor our union houses be crammed with able-bodied workmen, except in very inclement weather, as the use of this efficient implement would always doubly repay the employer. Since it has been introduced into our grounds, the spade, notwithstanding its superiority over the plough (one sound digging being allowed to be worth half a dozen ploughings), is cast completely into the shade. The comparative ease too by which the labourer is enabled to perform almost double the amount of work is astonishing. Every workman calls out for "the four or five pronged steel digging fork!" We remark that if those implements were generally put into constant use in the way above described, they would prove a boon to both master and man, and finally to the country at large, and we recommend that every other row of the said thick or full crops of corn now growing be dug up deeply, on a small scale at least, by these or some similar implements, to prove the truth of these observations before the middle of April has passed away, thus testing the utility of Parkes's steel digging forks before steam cultivation can be effected to supersede them. N.B. The free use of this famed implement between rows of Potatoes will amply repay the cultivator, and it may be introduced with certain profit till such time as the plants have appeared above ground a fortnight; or if a mark is drawn with the foot at the time of planting, or any other index showing where the rows are, the operation may be performed a month earlier with great advantage, and this observation will apply equally to the rows of corn. *Hardy & Son, Seed Growers.*

"How are we to find Food for our Flocks?"—In perusing an article in your Paper on this subject, may I beg leave to remark that the last winter has been unprecedented for severity and continuance in the principality for untold years, and still continues, April 20th; and our flocks have suffered immensely—25 to 50 per cent. in the lambs, and 10 to 15 per cent. in the ewes. Since the introduction of Chivas' Orange Jelly Turnip, I need scarcely say that where attention has been paid to its cultivation, no lack of good provision should be wanting for ewes and lambs in the spring. I have sown them on rather a large scale for some years; and this last winter, when my late Swedes gave way to the inclemency of the season, the Orange Jelly Turnip withstood the trial, and I am now drawing them daily, for cattle and the use of the table, in beautiful condition. I feel sorry to trespass upon your time, but should any remark I have made (and from experience) be worthy of an insertion in your valuable *Gazette*, I shall esteem it a great favour. *W. J. Ford, Llyngwern, near Machynlleth, N.W.* [We shall be glad for further information on the value of this root. Experience has varied exceedingly as to its merits.]

Hardy's Plant of Wheat from 8 pints of seed per acre is looking remarkably well, and appears, as they say, to have only one fault, that of being much too thick [!], which, however, they resolve upon remedying this week by thinning it to single plants by the hand. Their earliest, a small portion sown in August, is progressing admirably, and will, notwithstanding the lateness of the season, be in ear by the middle of May, and probably fit for the sickle in July. *A Constant Observer.*

Dairy Management.—I have read the letter from your correspondent "Y." in your last Number with much interest. Every one who has to do with a dairy must have observed the influence of temperature on the quantity of cream produced from a given quantity of milk, and many persons have tried to prevent the loss arising from low temperatures. There are two modes of doing this: 1st, by the application of heat to the vessel containing the milk; and 2dly, by raising the temperature of the dairy. Your correspondent "Y." seems to have availed himself of both these modes, and hence probably arises the difference of opinion as to the requisite temperature of the room between himself and Captain Carr, which he mentions. As in all these manipulations it is of the utmost importance to have an exact description of one that has succeeded, in order to insure success to others, I trust you will excuse me for requesting answers to the following questions:—1st. Having myself tried the application of heat to the vessel containing the milk with complete success as regards quantity, I have been obliged to give it up in consequence of the rank taste in the cream and butter thus obtained. Has your correspondent "Y." observed this in his dairy? 2d. What is the exact temperature at which he applies the hot water to the cistern containing his milk bowls? 3. The hot water being 3 inches deep, what is the depth of milk in the bowl? 4th. Are the bowls of metal or earthenware? 5th. For how long does the flow of hot water into the cisterns continue? *An Original Subscriber.*

Conveyance of Water in Underground Pipes.—In addition to former remarks may I add that at this present time I am intending to lay down a considerable extent of piping, and have secured 1400 yards 3-inch glazed pipes for that purpose, to reconstruct, and, I hope, improve a water-course which supplies my premises with water from the spring head, such spring being situated on an eminence in the midst of a wood rising higher than the cultivated land on millstone grit; having no natural or artificially used lime to be absorbed by the water to render it hard, it is clear, cool, and perfectly soft. Now as it may be of use to others bringing water to their houses and gardens, I will endeavour to explain the plan I intend to pursue. After having excavated the earth to a sufficient depth and impressed upon the cutting the shape of each socket, I shall first pour a small quantity of boiled coal-tar under each socket's mark on the ground, ere cementing the pipes together with some water cement. Afterwards upon the top of every such joint I shall again pour more tar, so as to unite the two together over and under each already cemented joint. All plants having an aversion to coal-tar, I hope by this double precaution to succeed in preventing effectually all future mischief, which has not been the case up to the present time in old-fashioned socket piping; for we have very often to take it up for repairs, and have pulled out roots of trees 60 feet long, resembling the tail of a fox.——Since writing the above I have read the remarks of "J. L., M.D., Newburgh," in your paper of the 21st April. I fear he is not a practical man, and that his project of filling up drains with sand would be too expensive, and would not answer after sufficient accumulation of water to form a run; for broken stones will not remain open long but silt up. Pipes with collars and a good fall are the best; for in theory, all drains after making commence filling up from the top downwards, and unless there is water from behind to sweep them clean they gradually fill up; therefore, if possible, I contrive to finish the top in a hollow that some flood or melting snow may form such an accumulation of water as may flush them clean; if not, it is advisable to have an upright termination, with knowledge of its locality, to do so artificially, as far cheaper to be attended to every few years than cutting and relaying them over again. *An Aged Practical Observer.*

Societies.

ROYAL AGRICULTURAL OF ENGLAND.

WEEKLY COUNCIL, *April 25*: Mr. MILES, M.P., President, in the chair.

ATMOSPHERIC SUPPLY OF MANURING MATTER.—Professor Way, Consulting Chemist to the Society, delivered a lecture before the members on the recent researches connected with this subject, which he regarded by no means a merely theoretical one, as it might at first seem; but one fraught with the most practical results in reference to agricultural operations. He glanced at the germination of seeds on surfaces containing little or no depth of soil, until rocks and towers became covered with vegetation—to the forests of western America, where successive scourging crops of Tobacco and Sugar were required to destroy the accumulated fertility, and to the coal-beds of various countries, which had

their origin in vegetable matter; facts which he thought must strike the most unobservant, that the air, producing as it did these vegetable products, must possess something more than a mere inert mixture of elastic fluids. He referred to the advantages derived by real science, though unintentionally, by the labours of the alchemists in their researches for gold and the elixir of life; but especially to the philosophical and more legitimate investigations of Priestley, Bergman, Scheele, Lavoisier, and De Saussure, whose genius in the direction of their experiments on air was only equalled by their candour and diffidence in deducing their results. These researches had first their application to the phenomena of animal and life, and subsequently to those of vegetation. Prof. Way then proceeded to explain the composition of the atmosphere, and the negative character of the nitrogen it contained, as controlling the active chemical nature of the oxygen. He stated that the carbonic acid gas mixed with the atmosphere, though small in proportion to the oxygen and nitrogen, was sufficient in amount to furnish carbon for the constitution of the whole of the coal-fields of the globe. He had nothing to remark, as new, on the watery vapour in the atmosphere. The most interesting subject of consideration at the present time was the occurrence of ammonia and of nitric acid in the air, and the mode in which their presence could be rendered still more available to the purposes of agriculture. He then explained how everything organic required by plants could be furnished by these four most powerful elements of the atmosphere and its aqueous vapour, namely, oxygen, hydrogen, carbon, and nitrogen. He described the recent experiments of M. Boussingault, and also those of M. Ville (splendidly illustrated in a work presented to the Society by the French Government), referring to the views on scientific principles of agriculture just published by Professor Liebig, the deductions of Mr. Pusey, the elaborate researches of Mr. Lawes, and the experiments of M. Barral. He alluded to the amount of ammonia in rain-water, dew, and fogs, and to the insufficiency of the methods hitherto employed for ascertaining the proportion of nitric acid in the air. He called attention to the large amount of ammonia constantly taken up by the soil, and washing into the land by rain; and to the great importance, consequently, of exposing the soil in such a manner to atmospheric influence as may best tend to this ammoniacal absorption. Fallowing of land, he remarked, had given way to rotation of crops; but that there was no such thing as such a simple resting as fallowing was supposed to imply in this case, for an alteration of the soil under the influence of oxygen was constantly going on. Every interval even, between one crop and another, was in reality a fallow. Land should be laid up as lightly as possible, for the purpose of its aeration. The working of land, with a view to this abundant aeration, was one important means of improvement. He regarded it as indispensable to the full development of the powers of soil that steam-power should be brought to bear effectively upon its cultivation. The amazing bulk of ammonia locked up in the land itself could not be taken up by plants, and would, therefore, remain in a form unavailable for vegetation, unless the management of soil tended to release such manuring matter, and bring it within the reach of the roots. He had calculated, from data furnished by some rich loamy land of tertiary drift, that the soil within available depths contained ammonia at the rate of one ton (equal to six tons of guano) per acre. This was a stock of wealth which would repay the most active measures being taken for its release and distribution. He then passed on to the subject of green manuring, and to that of draining, and the importance of a free aeration of the soil and increased absorption of ammonia, after the water had been duly carried off.—The Rev. L. Vernon Harcourt referred to the manner in which certain fungi absorbed nitrogen and the phosphates during the growth, and yielded ammonia and phosphates to the soil on their death and decomposition.—Professor Way explained the theory of fairy rings, given by him in the Journal some years ago; and his supposition that the development and expansion of the cells of the fungi attracted their air manure.—Dr. Calvert called attention to the electrical effects produced in the atmosphere by thunder-storms, and to the subsequent rapid vegetation in moorland districts; also to the theory of nitrification in nitre-beds.

On the motion of Mr. Raymond Barker, seconded by Dr. Calvert, the best thanks of the Council were given to Professor Way for the able and interesting lecture he had then delivered. The President, on putting the motion (which was carried unanimously), added his tribute of praise, remarking that nothing could more effectually, he thought, call thinking minds into operation than the science and the researches of the able men whose philosophical labours Professor Way had then brought under the review of the meeting. He delighted, as one of the earliest members of the Society, to witness the successful manner in which practice and science were more nearly approaching each other, for the more secure guidance of practical farmers, and for the benefit generally of the agricultural world.

Farm Memoranda.

Dorsetshire.—James John Farquharson, Esq., of Langton, who holds in hand no fewer than 4500 acres, managed by intelligent bailiffs, has the advantage of having, under nearly all that extent of land, a chalk subsoil, which performs, without expense, one of the most necessary, but, in many parts of the county, perplexing offices of good husbandry—drainage. This land is chiefly arable, and the course followed is the five-field shifts, the Clovers staying two years, and Red Clover occurring in the course once in 10 years. The Turnips, as well as the Mangolds, are grown on the ridge, and the clod-crusher is used to bind the Wheat-bands instead of the fold, which was formerly used for that purpose. The horse-hoe is kept actively at work amongst the Turnips, about half the bulk of which is drawn for stall-feeding. The roots to be fed off on the land are left in double drills. A cart of the width of two drills is used, so that the left Turnips are not injured by the wheels, whilst they are distributed evenly over the field. The labourers are paid by "tut" work, the dung-put fillers being paid by the square yard, and the spreaders and ploughmen by the acre. A portion of the ley ground is ploughed early in May and sown to Rape, which is fed off previous to its taking the Wheat in the autumn. From 80 to 100 acres of Italian Ray-grass are sown, and sometimes French Grasses, as a substitute for broad Clover. These are allowed to remain three years, and are fed off, generally by lambs. The stall beasts are kept in the vale during summer, and put up in sheds in October; they are supplied with cut Turnips, bruised Barley, and Linseed, the two latter being made into a "pudding," of which the beasts have half a gallon a day. The breeding cribs are cemented to prevent the intrusion of rats, and between every two cribs is a small trough, which is kept always full of water from a tank regulated by a ball-cock. Here is another excellent steam-engine, which works a useful threshing-machine. The corn is threshed, winnowed, sacked, and weighed, and the straw is cut into chaff when wanted concurrently with the threshing. By a simple but ingenious contrivance a bell rings as soon as the sack reaches its proper weight. Newcastle coal having burnt out the bars of the furnace, a vessel is freighted with coal from Scotland. About 6000 sheep, all pure Downs, are kept on the farms, as also from 40 to 50 fatting bullocks, and 60 working oxen, chiefly driven by reins in pairs. The tenantry on the estate of Henry Charles Sturt, Esq., of Critchell, are said to have been the first who themselves bought fixed engines for threshing, winnowing, &c. One of the first fixed engines was erected by Mr. Ford, of Rushton Farm, whose fat Hereford cattle occupy conspicuous places in the prize lists at Christmas. The general system upon this portion of Mr. Sturt's estates is five-field; but the following course has been found to answer well on stiff soils:—1. Swedes, fed off late in the spring; 2. Rape and Turnips, or Turnips alone, fed off in the following fall, and sown to; 3, Wheat; 4, Barley; 5, Clover; 6, old ley; 7, Wheat. One half of the Wheat stubs are brought into Barley, the other half into Swedes or Turnips; one-half of the Turnip land fed off is sown to Barley, the late-fed land affording another green crop. This course gives great advantages in the working of the land in unfavourable springs. On Mr. Sturt's home-farm there is a very perfect fixed steam-engine, which, besides threshing, winnowing, chaff-cutting, breaking bones, cracking Oats, Beans, &c., and dressing flour, pumps water for the supply of the house, stables, farm-yard, &c., and saws the wood for all buildings erected on the estate, cutting up in a summer's day 1400 feet of Oak or Elm, or 1800 of Fir timber. The engine is equal to this and the grinding of Barley at the same time; the boiler is tubular, and the consumption of coal about 5 cwt. for 12 hours. Mangolds are grown in this manner—During the winter, long dung is carted out, spread, and ploughed in, a subsoil-plough following. In the spring the land is found to work very freely, and it is again ploughed and worked about until reduced to a fine tilth. A sack, or 6 bushels, of bones, mixed with ashes, droppings of fatting beasts, &c., are sown broadcast, at the rate of 80 to 100 bushels per acre. The plough follows close and throws up the land in ridges, about 2 feet apart. A very light roller is drawn along the ridges to plane the surface, and men, women, and boys, follow with the seed in aprons, and dibble three or four seeds in at intervals of 12 inches. Another rolling completes the process. The plants are singled by hand, horse-hoed two or three times, and the soil between the plants is deeply hoed by hand. The crops have always been excellent without exception; the cost of putting in the seed is 5*s.* an acre, exclusive of horse labour and carter's; and last year the crop of Mangolds was about 42 tons per acre; Swedes are sown on the flat. A flock of 350 ewes are kept, the whole of the sheep sold being in a fat condition. The tups are put out about 12th Sept. The ewes seasoned in the first week are marked No. 1; those of the second week, No. 2, and so on. At the time of lambing they are taken into the yard in numerical order, to be under the eye of the shepherd; and it has happened invariably that since this plan has been followed—12 or 15 years—at shearing time, a greater number of lambs were living than there had been ewes put to the ram. As many as from 400 to 500 pigs are kept on the farm. In the five-field course a portion of the ley ground is sometimes broken up and sown to Rape and Turnips. Mr. J. A. Damen, who occupies a chalk farm near to the Bagshot sands at Winfrith, says, it is not unusual to let the sheep run over the Clover after the Barley is off; but it pulls up the plant, and the Clover is not half so good in the ear. Some sow it after the Barley, and give it a tine with the harrows; but he thinks it best to sow it with the Barley, give it one tine and a rolling. Italian Rye is sometimes grown in this neighbourhood, instead of clover; it comes very early in the spring, and the young lambs can be put upon it a month before the Clovers are ready for them. "We very often," says Mr. Damen, "have lambs upon it in January and February. I have fed it twice; then cut it for hay; then seeded it, and had 40 bushels of seed per acre." A good deal of fat beef and many sheep are grazed in this district, and it is computed that where one bullock was grazed 20 years ago there are now a score fattened. The consumption of oil-cake is very large; and artificial manures are extensively applied.—*Journal of the Royal Agricultural Society of England.*

Miscellaneous.

Cabbages.—For the purposes of the dairy 1 acre of Cabbages is considered to be worth 3 of Turnips. They require to be raised from seeds sown in beds in autumn or spring, and transplanted into the field towards the end of May, or in the beginning of June, and will be ready for use in October. One lb. of seed will produce 24,000 plants, and about 8000 plants are required to an acre of ground. The beds must be well sheltered, and have a free exposure to the sun of the whole day.

Calendar of Operations.

APRIL.

West Sussex.—There is little to speak of now but the very dry days, and the cold, and sometimes frosty nights; and, as a matter of course, cattle and sheep have got on short allowance. There is hardly a Turnip to be seen now, and the Clover seeds are not come to hand, so that all kinds of shifts must be tried. To use hay now is out of the question, as the sheep would rather starve than eat it. A little picking of Grass, with a pound of cake, is now their resource: and they apply themselves vigorously to the pond as they did last year. Mangold Wurzel has been more than useful this year in carrying the stock through; but now all is done. As a consequence the sale of lean stock is at a stand: but we cannot yet say that the prices are lower, for it seems to be felt that one little warm shower will put us all afloat again. With fat cattle there is no difficulty in parting at fair prices, and the same with sheep; perhaps a trifle below 5*s.* per stone is the fig . Lambs are a good sale, but they are brought into market be e they are hardly fit; about 6*s.* per stone is their value. Respect g the crops there is nothing to complain of. The Wheat lo s extremely well, and is now growing fast, notwithstanding e frosty nights and east winds. Barley and Oats have come up well; but without rain soon, we cannot expect them to cont e so long. But it will be some time before the Wheat suffers m h, as the frost had so pulverised the top of the soil that it now s fine and close in the best possible state for retaining moisture. The spring has not been favourable for top-dressing the Wheat, as guano (which I expect will after all prove the best dressing would in such weather lose all its good in the air. But it will not yet be too late if rain comes soon. The Turnip land is as easily prepared as it can be; there are no weeds to take out, and by keeping the roller close behind the cross ploughing all tendency to hardening is prevented; so that, though work at one time appeared behind, it will now be got as forward as is desirable. *G.S.*

Notices to Correspondents.

Artificial Guano: *K H.* We do not know the guano of which you send an analysis, and the analysis sent gives no index to its real value. "Organic matter and ammoniacal salts 32 per cent." may mean anything. And unless you actually know the quantity of ammonia capable of evolution from the guano, you cannot judge of its quality. Organic matter *may* be worthless as manure.

Books: *S.* You had better get Dr. Lindley's "Theory of Horticulture."

Cattle Gauge: *Old Subscriber.* Ewart's cattle gauge, by Tree, 22, Charlotte Street, Blackfriars Road, is the best. We regret to have been unable to answer this before Friday, by post, when you say it would have been useless to you.

Chandler's Liquid Manure Drill: *Anon.* You had better apply to Carson, of Warminster, Wilts, and to Tasker & Fowle, of Andover, Hants. The one firm makes Chandler's, and the other Spooner's liquid manure drill. Both sow seed as well as manure, and you can compare the reports you receive and judge for yourself.

Corn Manure: *A Constant Reader.* We should not like to trust to any single dressing of manure to ensure a crop of grain after grain on land that has been cross cropped for several years. Your best chance is to get the whole land thoroughly tilled during the autumn, and manured then with dung to some, however small, extent—to sow Beans after the Wheat, and spring Wheat after the Barley and Oats as early as possible in the spring, top-dressing with guano and hoeing it in in April.

Guardian Society, Manchester: *One who was Duped* will oblige us by his address. This question is in reference to a swindler detected by the Guardian Society.

Nettles: *G W.* Their roots must be forked up. That is the only plan to get rid of them.

Oats for Fodder: *J Irvin.* We would rather sow 3 bushels of Vetches and 1 bushel of Oats in May per acre for cutting green in September than sow Oats for that purpose by themselves. But we do not know how Vetches suit in your country: and perhaps as the land is just broken up it may be worth more to pare and burn it, and sow Rape seed, than to attempt either Vetches or Oats.

Taste of Butter: *Dairymaid.* The principle of all successful attempts to get rid of the taste of roots in milk is to keep the liquid hot for longer time than usual, so as to cause the evaporation of the arema. This and cleanliness will generally succeed.

Value of Pigeons' Dung: The following information on this point has just appeared in the Journal of the Agricultural Improvement Society of Ireland, in the form of a letter from Professor Apjohn:—"The best way, I believe, of replying to Mr. Smyth's inquiries in relation to pigeons' dung as a fertilising agent, is to direct his attention to the following equivalent numbers, deduced from the best analyses:—

Farm-yard manure, moist	100
Pigeons' dung, fresh	172
Peruvian guano	38

"From these data, it appears that pigeons' dung in its recent state is, weight for weight, about six times as valuable as farm-yard manure, and that its fertilising influence is to that of best Peruvian guano in the ratio very nearly 1 to 4. In cases, therefore, in which 4 cwt. of guano would be applied to an acre of tillage, 16 cwt. of fresh pigeons' dung may be expected to produce an equivalent action.

"As to 'the best way of managing pigeon manure,' I would say that, while fresh, it should be made into a compost with clay and peat charcoal, to prevent the loss of ammonia which would otherwise occur during its desiccation, and that this compost should be used for green and other crops precisely in the manner in which guano is applied."

WILLIAM DRAY AND CO.'S STEEL DIGGING

FORKS are warranted equal, and by many are considered superior, to any in use. Three Tine Forks, 4*s.* 6*d.* each; Four Tine Forks, 5*s.* 6*d.* each. A liberal allowance on Wholesale Orders.

WILLIAM DRAY & Co., Swan Lane, Upper Thames Street, near London Bridge.

PARKES' STEEL DIGGING FORKS & DRAINING TOOLS.

MESSRS. BURGESS AND KEY, as Mr. PARKES' Wholesale Agents for England, have always in stock a large assortment. These Forks and Tools are now in use by upwards of 1000 of the Nobility and Farmers, members of the Royal Agricultural Society, who pronounce them to be the best ever invented, and to facilitate labour at least 20 per cent. Price Lists sent free on application, and Illustrated Catalogue of the best Farm Implements, on receipt of eight postage stamps.

103, Newgate Street, and 52, Little Britain, London.

CAUTION.

PARKES' STEEL DIGGING FORKS AND DRAINING TOOLS.

Whereas very inferior descriptions of Steel Digging Forks are now manufactured and sold, and I have been informed that purchasers of the same have believed them to be the same as those manufactured by me, and to which the Royal Agricultural Society and numerous Agricultural Societies' prizes have been awarded, I hereby respectfully inform the public that every Fork manufactured by me is stamped with my trade mark "J. P.," and that Messrs. BURGESS & KEY, of No. 103, Newgate Street, London, are my sole Wholesale Agents, and I have authorised them to replace to the purchaser every Fork of my manufacture found defective; they will also on application send Wholesale and Retail Price Lists, &c., post free. FRANCIS PARKES & Co.

WARNER'S IMPROVED LIQUID MANURE, OR GENERAL PORTABLE PUMP.

The valve is a ball of imperishable material, and cannot clog in action. The barrel is of galvanised iron, not likely to corrode, and can be raised or lowered at pleasure. The legs will fold together, and the whole may be carried on shoulder to any pond or tank required.

Price of 4½ in. Pump, with legs, 3*l.* 3*s.* The barrel is 27½ in. long, and the legs are 5 ft. high.

1½ inch Gutta Percha Suction Pipe, 1*s.* 6*d.* per foot.

1½ inch Flexible Rubber and Canvas Suction Pipe, 3*s.* 6*d.* per foot.

May be obtained of any Ironmonger or Plumber in town or country, at the above prices, or of the Patentees and Manufacturers, JOHN WARNER & SONS, 8, Crescent, Jewin Street, London.

Every description of Machinery for Raising Water, by means of Wheels, Rams, Deep Well Pumps, &c.; also Fire and Garden Engines, &c.—Engravings sent on application.

WARNER'S PATENT VIBRATING STANDARD PUMPS.

PATENT CAST-IRON PUMPS, for the use of Farms, Cottages, Manure Tanks, and Wells of a depth not exceeding 30 feet.

Diameter of Barrel	Length of Barrel, under nose.		£	s.	d.
2½ in.	short 1 ft. 7 in.	Fitted for lead, gutta percha, or cast iron flanged pipe, as required.	1	12	0

2½ "	short, with 15 feet of Lead Pipe attached, and Bolts and Nuts ready for fixing		2	12	0
2½ in.	long ditto	ditto ditto	2	15	0

The short barrel Pump is very convenient for fixing in situations of limited height and space, for the supply of coppers and sinks in Wash-houses with soft water from underground tanks, or in Hot, Forcing, and Plant Houses; they may be fixed, when desired, under the stage.

May be obtained of any Ironmonger or Plumber in Town or Country, at the above prices, or of the Patentees and Manufacturers, JOHN WARNER AND SONS, 8, Crescent, Jewin Street, London.

Every description of Machinery for Raising Water, by means of Wheels, Rams, Deep Well Pumps, &c.; also Fire and Garden Engines, &c. &c.—Engravings sent on application.

JOHN WARNER AND SONS,

Crescent, Jewin Street, London.

GALVANISED IRON TUB GARDEN ENGINE,

WITH WARNER'S REGISTERED SPREADER,

is strongly recommended, for durability and low price, viz., 2*l.* 19*s.*, to hold 10 gallons.

Larger sizes in wood or iron. May be obtained of any Ironmonger or Plumber in town or country, or of the Patentees and Manufacturers, as also Machinery of all kinds for raising Water from any depth to any height by Steam, Horse, or Manual Power. Prices sent on application. Syringes of various constructions and sizes from 9*s.* upwards. Metallic String from 5*d.* to 1*s.* 3*d.* per lb.

JOHN WARNER AND SONS, 8, Jewin Crescent, London, Manufacturers of FIRE ENGINES, PUMPS, GARDEN ENGINES, and SYRINGES.

Brass Syringes, 9*s.* to 18*s.*

All articles of JOHN WARNER & SONS' manufacture may be obtained of any Ironmonger or Plumber in town or country, at the advertised prices.

JOHN WARNER & SONS having been practical Horticulturists for many years, know exactly the requirements of both Amateurs and Gardeners. A gardener with a properly constructed pump will get through as much work in five minutes as he could with any Syringe in a quarter of an hour, and with half the labour to himself. Syringes are economical for small houses.

No establishment offers such a variety of effective machines for hydraulic purposes, whether to supply Gardens, Hothouses, Cottages, Farms, Mansions, or Boards of Health, with every requisite connected with the conveyance and distribution of liquids.

Fountains suitable for Conservatories, Lawns, &c.

Sheets of Engravings sent on application.

PRIZE MEDAL—1851.

AT A VERY ECONOMICAL RATE.

SAMUEL CUNDY, Mason and Builder, Pimlico Marble and Stone Works, Belgrave Wharf, Lower Belgrave Place, Pimlico, London.

Marble Chimney-pieces manufactured by improved machinery. The public are invited to view the stock, unequalled for quality and price. A good Marble Chimney-piece for 40s. Marble Work in all its branches at a remarkably cheap rate for Halls, Dairies, Larders, &c. Circulars sent on application.

N.B. The "Royal Blue" Omnibuses pass the Works every ten minutes from the Bank.

LINGHAM BROTHERS, No. 170, Hampton Street, Birmingham, sole Manufacturers of the improved WOOD and ZINC MONOGRAPH, or LABELS for Garden Borders, Flower-pots, &c., in boxes of 100 each. The Zinc Labels are highly approved of for their lasting durability, can be written upon with the greatest ease, and when dry a permanent inscription is secured. Directions are sent with each box, including a bottle of metallic ink. Sole Agents in London, Messrs. Drake, Dray & Co., Horticultural Implement Warehouse, 16, King William Street, London Bridge.

(Fig. 1.) (Fig. 2.)

J. TYLOR and SON'S BARROW GARDEN ENGINE (Fig. 1), in best well painted oak tub, fitted with improved Pump, universal joint, and registered Spreader, which answers the purpose of the separate rose fan and jet.

No. 14	30	"	45	"	... 5 18

A large assortment of every description of Garden Syringes, Pail Engines, Conservatory Pumps, &c., kept in Stock.

No. 1, Plain Syringe, with rose and jet, diameter of barrel, 1¼ inch, 14s. 3d.; No. 2, do., diameter of barrel, 1⅜ inch, 12s.; No. 3, do., diameter of barrel, 1⅜ inch, 10s. 6d.

Read's Syringe, with two roses and one jet, 19s.

J. Tylor & Son's Horticultural Apparatus may be obtained at these prices from any respectable Ironmonger or Seedsman in town or country, through whom alone they will be supplied, and of whom Drawings and Prices may be had.

N.B. Cost of carriage, &c., not included in these prices.

J. Tylor & Son's Manufactory, Warwick Lane, Newgate Street, London.

J. TYLOR and SON'S REGISTERED GARDEN SYRINGE. Small size, for Amateur use, **21s.** each; Large size, for Gardeners' use, **25s.** each.

Extra for Telescope Tube as shown in engraving for watering plants on stands at a height of 8 feet, so that any quantity of water can be deposited in the pot without wetting the leaves, 10s.

By a simple arrangement this Syringe is rendered more effective than any portable Conservatory or Garden Pump ever offered to the public. It is equally adapted for Garden or Conservatory use, and is capable of discharging twice as much water in a given time as any other Syringe now in use. The arrangement consists in attaching a small flexible suction tube to the barrel of the Syringe, through which it is filled with water at every discharge of the previous contents. By this means the Syringe is always charged, and the pull-up stroke of the piston rendered perfectly easy, it having, indeed, no work to do, the barrel being previously full of water. Being thus made self-supplying, a great saving of labour is effected; and the necessity of stooping to fill the syringe at every discharge being done away with, the direction of the water can be maintained for any length of time. It is perfectly cleanly in its action, as it is not possible for any water to get on the outside of the barrel, which is a well-known inconvenience attendant on the use of every other Syringe. Its construction is perfectly simple, and cannot get out of order: the ground in ball valves and fittings used for filling all other patent Syringes being entirely superseded. To be had of any respectable Ironmonger or Seedsman in town or country.

J. Tylor & Sons, Manufacturers of Horticultural Apparatus, Warwick Lane, Newgate Street, London.

N.B. These prices do not include carriage, package, or expenses of delivery in the country.

BEEHIVES.

NEIGHBOUR'S IMPROVED COTTAGE BEE-HIVE, as originally introduced by George Neighbour & Sons, with all the recent improvements, glasses, thermometer, &c., price 35s., securely packed for the country.

This unique hive has met with universal commendation, and may be worked with safety, humanity, and profit, by the most timid; its arrangements are so perfect, that the honey may be taken at any time of the gathering season without at all injuring the bees.

Early applications, addressed to Geo. Neighbour & Sons, 127, High Holborn, or 149, Regent Street, London, will receive prompt attention. Their newly arranged Catalogue of other improved Beehives, with Drawings and Prices, sent on receipt of two stamps.

Agents:—Manchester, Hall & Wilson, 50, King Street; Liverpool, James Cuthbert, 12, Clayton Square; Chester, F. & A. Dickson & Sons, 106, Eastgate Street; Glasgow, Austen & M'Aslan, 186, Trongate Street; Dublin, J. Edmundson & Co., 61, Dame Street.

COTTAM and HALLEN have on Show, at their Repository, No. 2, Winsley Street, Oxford Street, London, a great variety of the following articles for the Garden, &c., at very low prices, viz.:—Garden Rollers, Cast-Iron Rickstands, Garden Engines, Mowing Machines, Garden Chairs, Superior Garden Tools of all kinds, Garden Vases and Pedestals in great variety, and a large assortment of Horticultural and Agricultural Implements.

Ornamental Wire Flower Stands, Pot Trainers, Rose Tree Guards, Flower Bordering, and every description of Wire Work, both plain and ornamental.

Hand Glass Frames, Cast and Wrought Iron Flower Stakes, Garden Arches, &c.

Strong Iron Hurdles, and best Wire for Strained Wire Fencing.

Hothouses, Conservatories, &c., made upon the most improved principle, either of Iron, or of Iron and Wood combined, which can be fixed complete, with Hot Water Apparatus, in any part of the Kingdom.

Show Rooms at the Manufactory, 2, Winsley Street, Oxford Street, opposite the Pantheon, where every information may be obtained.

MOORE'S PATENT VENTILATOR, for every Description of Farm-Buildings, Conservatories, Hot-houses, Warehouses, Market-houses, Bell-turrets, also for Ventilating Shafts, &c.

These Ventilators are fitted to side-slips of wood with iron levers, iron flanges, and brass screws, with rough plate, or 32 oz. sheet glass, at 4s. per foot super. 2s. 6d. extra for necessary fittings to each Ventilator. If with brass levers in place of iron, 4s. per pair extra. It is presumed the accompanying drawing of a Greenhouse will show the advantages obtained (independent of a most perfect system of Ventilation, by admitting any amount of fresh air and distributing equally over the plants, &c., and at the same time emitting the vitiated), viz., a much neater appearance, and an uninterrupted view of the whole interior. Greenhouses at Mr. James Veitch, Jun., Exotic Nursery, King's Road, Chelsea; Messrs. Veitch & Sons, Nursery, Exeter; Messrs. Messrs. Perry, Nursery, Banbury; and the Pleasure Grounds at Hampton Court Palace; having been fitted with these Ventilators with perfect success, the Patentee has obtained permission to refer to the above places all parties desirous of seeing the same.

These Ventilators have been applied to many other Greenhouses, Conservatories, &c., but they are not published, in order to avoid giving unnecessary trouble. Fifty-four of these Ventilators, 5 ft. square (34 on the roof at an angle of 60 degrees), have been fitted at Her Majesty's Saltpetre Works, Waltham Abbey; the success of which has been proved by the fact, that the saltpetre is crystalised in little more than half the time, previously to the light and ventilation obtained by the adoption of these Ventilators.

Moore's double-current Ventilators for External Walls, &c. Ventilators for every description of apartment, from the Cottage to the Palace. Stained and Ornamental Glass if required. In taking the size, the exact opening should be given, stating the height and width distinctly. Tariff Prices of the ordinary Ventilators may be had on application at either of the above addresses. Packing cases allowed full price when returned free.

N.B.—These Ventilators can be readily fitted to Greenhouses already erected, by removing the entire sashes and fixing the Ventilators in their places.

Perfect Ventilation in all Cases Guaranteed.

Church, Turret, Musical and House Clock Makers, to the Lords of the Admiralty, the Hon. Board of Ordnance, the Emperor of China, &c.

London: 81, Fleet Street, London.—Manufactory, Sekford Works, Clerkenwell.

GLAZING WITH OR WITHOUT PUTTY.

E. DENCH, Patent Hothouse Works, King's Road, Chelsea.—Printed Price Lists supplied on application.

GLASS FOR CONSERVATORIES, ETC.

HETLEY and CO. supply 16-oz. SHEET GLASS, of British Manufacture, at prices varying from 2d. to 3d. per square foot, for the usual sizes required, many thousand feet of which are kept ready packed for immediate delivery.

Lists of Prices and Estimates forwarded on application, for PATENT ROUGH PLATE, THICK CROWN GLASS, GLASS TILES and SLATES, WATER-PIPES, PROPAGATING GLASSES, GLASS MILK PANS, PATENT PLATE GLASS, ORNAMENTAL WINDOW GLASS, and GLASS SHADES, to James Hetley & Co., 35, Soho Square, London.

See *Gardeners' Chronicle* first Saturday in each month.

BY ROYAL LETTERS PATENT.

THE COSMOPOLITAN GLASS COMPANY.—The Managers beg to inform the Nobility and Gentry, Farmers, Gardeners, &c., that their new List of Prices may be had free on application at the Company's Depôt, 296, Oxford Street, London.

HARTLEY'S PATENT ROUGH PLATE GLASS, for Conservatories, Public Buildings, Manufactories, Skylights, &c.

JAMES PHILLIPS and CO., Horticultural Glass Warehouse 116, Bishopsgate Street Without, London.

Extract from *Gardeners' Chronicle*, April 21, 1854.

"The garden also supplied some Neapolitan Cabbage Lettuces, a portion of which had been grown under bell-glasses which differ from the French cloche in having a ventilator at the top in the shape of a neck or chimney, which can be left open or kept close as may be desired, by covering it over or not with another small bell glass, made for the purpose. The result of this trial has been very satisfactory."

TRELOAR'S COCOA-NUT FIBRE MANUFACTURES, consisting of MATTING, MATS, MATTRESSES, BRUSHES, NETTING, HORSE-HAIR, and BRISTLE SUBSTITUTE, are distinguished for superiority and excellency of workmanship, combined with moderate prices. Prize Medal both in England and America at the Exhibition of all Nations.

T. Treloar, Cocoa-nut Fibre Manufacturer, 42, Ludgate Hill, London.

"FRIGI DOMO."—Patronised by her Majesty the Queen, the Duke of Northumberland for Syon House, His Grace the Duke of Devonshire for Chiswick Gardens, Professor Lindley for the Horticultural Society, Sir Joseph Paxton for the Crystal Palace, Royal Zoological Society, Mrs. Lawrence, of Ealing Park, and — Collier, Esq., of Dartford.

PROTECTION FROM MORNING FROST.

"FRIGI DOMO," a Canvas made of patent prepared Hair and Wool, a perfect non-conductor of Heat and Cold, keeping, wherever it is applied, a fixed temperature. It is adapted for all horticultural and floricultural purposes, for preserving Fruits and Flowers from the scorching rays of the sun, from wind, from attacks of insects and from morning frosts. To be had in any required length, 2 yards wide, at 1s. 6d. per yard run, of Eustace Thomas Archer, whole and sole manufacturer, 7, Trinity Lane, Cannon Street, City, and the Royal Mills, Wandsworth, Surrey; and of all Nurserymen and Seedsmen throughout the kingdom.

"It is much cheaper than mats as a covering."

TO NURSERYMEN AND GARDENERS.

REIGATE SILVER SAND, 12*s.* per ton, 1*s.* 6*d.* per bushel, or 16*s.* per ton, delivered to any of the London Wharfs or Railways, or within a circuit of five miles. Peat and Loam of various qualities. Sacks 2*s.* each.

KENNARD BROTHERS, Swan Place, Old Kent Road.

FULLER'S EARTH WORKS, CHART LODGE, REIGATE, SURREY.

NOTICE.—SILVER SAND.

GAWKROGER AND HYNAM beg to inform the Nobility and Gentlemen, Gardeners, Nurserymen, Florists, and Seedsmen, that they are prepared to supply them with the REIGATE SILVER SAND, which is known by its superior whiteness and fine quality, and is much used in the Propagation and Growth of Greenhouse Plants, &c. It will be sent in fine bags, and delivered to any of the Railway Carriers, or Wharfs in London, in not less than ½ ton lots of 10 bushels, at the rate of 2 per ton. Parties requiring lots of 4 tons and upwards can have the Sand delivered loose or in bags at the Bricklayers' Arms Station, or within five miles of the same, at a very low price.—For further particulars, apply at the Offices of JAMES GAWKROGER, 21, Union Street, Halifax, Yorkshire; and JOHN HYNAM, 7, Princes Square, Wilson Street, Finsbury, London.

TO HORTICULTURISTS, GARDENERS, FLORISTS, ETC.

METALLIC WIRE suitable for Training and Fastening Fruit Trees, Shrubs, Flowering Plants, &c., of all sizes (wire guage) is manufactured at our Lead Works in this city at reduced prices.—Samples and prices will be forwarded on application to DAVIDSON and ARMSTRONG, City Lead Works, Manchester.

HOW TO KILL RATS, MICE, AND MOLES BY HUNDREDS.—A Method will be forwarded with instructions for 30 postage stamps, which will destroy the above vermin quickly and without trouble. 1000 acres may be cleared for a few shillings.

GILBERT DYSON, Hoo, Rochester.

THE CRYSTAL PALACE FLOWER BASKETS made to the original, and a variety of new and elegant Designs for Conservatory, Verandah, Drawing-room, &c., from 3*s.* 6*d.* upwards, by W. RICHARDS, WIRE-WORKER, &c., 370, Oxford Street, nearly opposite the Princess's Theatre. Conservatories fitted up, Aviaries, Bird-cages, Flower Stands, and every description of Wire work. Game and Garden Fencing of the best description.

N.B. Holland, Venetian, Wire, and all kinds of Sun shades, and Window Blinds of best quality.

GARDEN VASES, FOUNTAINS, ETC.

THOMAS SOMMERVILLE, LANDSCAPE GARDENER, NURSERYMAN, SEEDSMAN, and FLORIST, Garden Road, St. John's Wood, London, begs respectfully to inform the nobility, gentry, and his patrons generally, that he has entered into arrangements with an eminent company in Scotland for the sole disposal in London of their highly ornamental and very durable Vases, Fountains, &c., samples of which may be seen at his grounds in the Garden Road, as above.

T. S. has much pleasure in being the first to introduce to the notice of the public a highly ornamental Vase, capable of resisting the most severe weather, and at little more than half the cost of any other possessing the same qualities; and he has no hesitation in stating that a more suitable Vase for the growth of plants cannot be manufactured.

CLAYTON, SHUTTLEWORTH, AND CO.'S PRIZE PORTABLE STEAM ENGINES, AND COMBINED THRESHING, STRAW SHAKING, RIDDLING AND WINNOWING MACHINE may be seen at their London Establishment, 6, Fitzroy Terrace, New Road, where all information relative thereto can be obtained. These Machines are constructed to horn Barley, and make a perfect separation of the chaff from the pulse. They are fitted with Elevators, which deposit the grain into bags, and beyond the feeder of Machine require no hands except to take away the Corn, &c., as threshed, the whole of the operations being performed by self-acting machinery, whereby the Corn, Straw, Chaff, and Pulse are delivered in the places assigned for them.

C. S. & Co. have paid special attention to this class of Machinery, and Fixed Barn Machinery, and from the position they have taken at the Royal and all the leading Agricultural Shows of England, flatter themselves that for efficiency, durability, and simplicity, their Engines and Machines are not surpassed by any other maker in England. All letters forwarded to the Works at Lincoln will have immediate attention; and Illustrated Catalogues forwarded to all parts of the kingdom postage free.

DEANE'S WARRANTED GARDEN TOOLS.—Horticulturists and all interested in Gardening pursuits are invited to examine DEANE, DRAY, AND CO.'S extensive Stock of GARDENING and PRUNING IMPLEMENTS, best London-made Garden Engines and Syringes, Colebrook Dale Garden Seats and Chairs.

BERRY, BROTHERS, & Co., 3, St. James's Street, London.

GLENFIELD PATENT STARCH, used in the Royal Laundry, and pronounced by her Majesty's Laundress to be the finest Starch she ever used.

Sold by all Chandlers, Grocers, &c. &c.

NO CHARGE FOR WATERPROOFING.

BERDOE'S VENTILATING WATERPROOF LIGHT OVER-COATS, CAPES, SHOOTING JACKETS, &c., for all seasons. These well-known, respectable, and economical garments resist any amount of Rain, without confining Perspiration (the fatal objection to all other waterproofs), are intended, not merely for rainy weather, but general use, at all times. Capes, 30*s.* to 40*s.*; Coats, 40*s.* to 50*s.*—W. BERDOE, 96, New Bond Street, and 69, Cornhill (only).

112, REGENT STREET, LONDON.

MR. MECHI has opened a new Establishment, at 112, Regent Street, opposite Vigo Street, *where the same prices will be charged as at* 4, *Leadenhall Street.* Visitors from the country, and the London public, are respectfully solicited to inspect the entirely New and Elegant Stock of Dressing Cases and Bags, Papier Maché, Cutlery, and a very extensive assortment of Elegancies, suitable for presentation.

AT MR. MECHI'S ESTABLISHMENTS, 112, Regent Street, and 4, Leadenhall Street, London, are exhibited the finest specimens of British Manufactures in Dressing Cases, Work-boxes, Writing Cases, Dressing Bags, and other articles of utility or luxury. A separate department for Papier Maché Manufactures and Bagatelle Tables. Table Cutlery, Razors, Scissors, Penknives, Strops, Paste, &c. Shipping orders executed. Superior Hair and other Toilet Brushes.

BUY OF THE MAKERS.—BRUSHES, COMBS, and BROOMS of every description, whether for the dressing table, household, or stable use, 30 per cent. lower than any other house in the trade, at the manufacturers, J. and J. WITHERS, 36, Tottenham Court Road (opposite Bedford Street, Bedford Square).—Warranted Tooth Brushes, 3*d.*; superior ditto, 4*d.*; the best that can be made, 6*d.* each.—N.B. The lowest price asked and no abatement.

SUPERIOR FIRST CLASS CABINET AND UPHOLSTERY FURNITURE can only be obtained at moderate prices by purchasing direct from the manufacturer, thus saving the profit of the middle man, and securing thoroughly seasoned materials with soundness of workmanship, and an elegance of style not to be found at other houses. Families furnishing are respectfully solicited to inspect the extensive stock of Cabinet Furniture, Bedsteads, and Bedding, at JOHN VOLLUM'S old established manufactory, No. 3, Finsbury Pavement. Designs and Estimates made for furnishing a house or single room in any part of the country free of charge. No charge made for packing country orders. Observe—No. 3, Finsbury Pavement, London, and the name most distinctly JOHN VOLLUM.

FENDERS, STOVES, AND FIRE-IRONS.—Buyers of the above are requested, before finally deciding, to visit WILLIAM S. BURTON'S SHOW ROOMS, 39, Oxford Street (corner of Newman Street), Nos. 1, 2, and 3, Newman Street, and 4 and 5, Perry's Place. They are the largest in the world, and contain such an assortment of FENDERS, STOVES, RANGES, FIRE-IRONS, and GENERAL IRONMONGERY as cannot be approached elsewhere, either for variety, novelty, beauty of design, or exquisiteness of workmanship. Bright Stoves, with bronzed ornaments and two sets of bars, 2*l.* 14*s.* to 5*l.* 10*s.*; ditto, with ormolu ornaments and two sets of bars, 5*l.* 10*s.* to 12*l.* 12*s.*; Bronzed Fenders complete, with standards, from 7*s.* to 3*l.*; Steel Fenders from 2*l.* 15*s.* to 6*l.*; ditto, with rich ormolu ornaments, from 2*l.* 15*s.* to 7*l.* 7*s.*; Fire-irons from 1*s.* 9*d.* the set to 4*l.* 4*s.* Sylvester and all other Patent Stoves, with radiating hearth plates. All which he is enabled to sell at these very reduced charges,

1st,—From the frequency and extent of his purchases; and,

2dly,—From those purchases being made exclusively for cash.

BATHS AND TOILETTE WARE.—WILLIAM S. BURTON has ONE LARGE SHOW ROOM devoted exclusively to the DISPLAY of BATHS and TOILETTE WARE. The stock of each is at once the largest, newest, and most varied ever submitted to the public, and marked at prices proportionate with those that have tended to make his establishment the most distinguished in this country. Portable Showers, 7*s.* 6*d.*; Pillar Showers, 3*l.* to 5*l.*; Nursery, 15*s.* to 32*s.*; Sponging, 15*s.* to 32*s.*; Hip, 14*s.* to 31*s.* 6*d.* A large assortment of Gas Furnace, Hot and Cold Plunge, Vapour, and Camp Shower Baths. Toilette Ware in great variety, from 15*s.* 6*d.* to 45*s.* the Set of Three.

THE BEST SHOW OF IRON BEDSTEADS in the Kingdom is WILLIAM S. BURTON'S.—He has two very Large Rooms, devoted to the exclusive show of Iron and Brass Bedsteads and Children's Cots, with appropriate Bedding and Mattresses. Common Iron Bedsteads, 18*s.*; Portable Folding Bedsteads from 12*s.* 6*d.*; Patent Iron Bedsteads, fitted with dovetail joints and patent sacking, from 17*s.* 6*d.*; and Cots from 20*s.* each; handsome Ornamental Iron and Brass Bedsteads, in great variety, from 2*l.* 13*s.* 6*d.* to 15*l.* 15*s.*

PAPIER MACHE AND IRON TEA-TRAYS.—An assortment of Tea Trays and Waiters wholly unprecedented, whether as to extent, variety, or novelty.

New oval Papier Maché Trays, per set of three	from 20*s.* to 10 guineas.
Ditto, Iron ditto	from 18*s.* to 4 guineas.
Convex shape, ditto.	from 7*s.* 6*d.*

Round and Gothic Waiters. Cake and Bread Baskets equally low.

WILLIAM S. BURTON has TEN LARGE SHOW ROOMS, all communicating, exclusive of the Shop, devoted solely to the show of GENERAL FURNISHING IRONMONGERY (including Cutlery, Nickel Silver, Plated and Japanned Wares, Iron and Brass Bedsteads and Bedding), so arranged and classified that purchasers may easily and at once make their selections.

Catalogues, with engravings, sent (per post) free. The money returned for every article not approved of.

No. 39, Oxford Street (corner of Newman Street); 1, 2, and 3, Newman Street; and 4 & 5, Perry's Place.

NO CHARGE FOR STAMPING at LOCKWOOD'S, 75, New Bond Street. LOCKWOOD'S celebrated Nugget (Gilt) Pen 1 doz. post free for 13 stamps.

DINNEFORD'S PURE FLUID MAGNESIA has been for many years sanctioned by the most eminent of the Medical Profession, as an excellent remedy for Acidities, Heartburn, Headache, Gout, and Indigestion. As a mild aperient, it is admirably adapted for delicate females, particularly during pregnancy; and it prevents the food of infants from turning sour during digestion. Combined with the Acidulated Lemon Syrup, it forms an Effervescing Aperient Draught, which is highly agreeable and efficacious.—Prepared by DINNEFORD & CO., Dispensing Chemists (and General Agents for the Improved Horse-Hair Gloves and Belts), 172, New Bond Street, London, and Sold by all respectable Chemists throughout the Empire.

DR. DE JONGH'S

LIGHT BROWN COD LIVER OIL.—This OIL long known, extensively prescribed, and highly appreciated on the Continent, has now, in consequence of its proved superior power and efficacy, acquired the general and entire confidence of the medical profession in this country. It is of the purest and finest quality, free from admixture and adulteration, or the usually repulsive and nauseous flavour, or sickly after-taste of the pale Oil, or of the coarse brown Oil commonly sold, though totally unfit for medicinal use. It is as low in price per ounce as any other genuine Cod Liver Oil, whilst its regular and speedy effects render it incalculably cheaper. Medical and scientific testimonials of the highest character delivered or forwarded gratis on application.—Sold in bottles, capsuled and labelled, with Dr. De Jongh's stamp and signature, WITHOUT WHICH NONE ARE GENUINE, by ANSAR, HARFORD, and CO., 77, STRAND, London, Dr. De Jongh's sole accredited Agents; and by respectable Chemists in Town and Country. Half-pints (10 oz.), 2*s.* 6*d.*; Pints (20 oz.), 4*s.* 9*d.*; Quarts (40 oz.), 9*s.* IMPERIAL MEASURE.

METCALFE, BINGLEY, AND CO.'S OATMEAL and CAMPHOR SOAP, in tablets (registered Nov. 3, 1854). Price 6*d.* each. This soap will be found the purest and most perfect winter soap ever introduced to the public. It preserves the hands from chapping, and renders the skin soft and agreeable.—Sold wholesale and retail by the inventors and sole manufacturers, METCALFE, BINGLEY, & Co., Brushmakers and Perfumers to H.R.H. Prince Albert, 130B and 131, Oxford Street.

CAUTION.—To prevent fraud, each tablet bears the registered mark and the names and address of the inventors, as above.

METCALFE'S ALKALINE TOOTH POWDER, 2*s.* per box.—The above may be obtained of most respectable Chemists, Perfumers, &c.

A CLEAR COMPLEXION.

GODFREY'S EXTRACT OF ELDER FLOWERS is strongly recommended for softening, beautifying, and preserving the skin, and giving it a blooming and charming appearance, being at once a fragrant Perfume and delightful Cosmetic. It completely removes tan, sun-burn, redness, &c., and by its balsamic and healing qualities renders the skin soft, and free from dryness, scurf, &c.; clears it from every humour, pimple, or eruption; and by continuing its use only a short time the skin becomes and continues soft and smooth, and the complexion clear and beautiful. In the process of shaving it is invaluable, as it annihilates every pimple and all roughness, and affords great comfort if applied to the face during cold easterly winds.—Sold in Bottles, price 2*s.* 9*d.*, with directions for using it, by all Medicine Vendors and Perfumers.

ASTROLOGY.—Persons residing in London or elsewhere can send any Address, Christian and Surname, and Age, in a letter containing 13 postage stamps, to Professor MELVILLE, Princes Road, Lambeth, London (the only Acrostic Astrologer in the universe), and they will receive by return of post special poems on their names, in which their Destinies will be revealed.

YOURSELF! WHAT YOU ARE! AND WHAT FIT FOR!—The secret Art of DISCOVERING the CHARACTER of INDIVIDUALS from the peculiarities of their HANDWRITING, has long been practised by Miss Graham with astonishing success. Her startling delineations are full and detailed, differing from anything hitherto attempted. All persons wishing to "know themselves," or any friend in whom they are interested, must send a specimen of their writing, stating sex and age, inclosing 13 penny postage stamps, to Miss GRAHAM, 10, Chichester Place, King's Cross, London, and they will receive a minute detail of the mental and moral qualities, talents, tastes, affections, virtues, failings, &c., of the writer, with many other things hitherto unsuspected.—A Copy of extraordinary Clairvoyant Revelations sent post free for six penny stamps.

THE SUCCESSFUL RESULTS OF THE LAST HALF CENTURY HAVE PROVED BEYOND QUESTION THAT

ROWLAND'S MACASSAR OIL possesses peculiarly nourishing powers in the growth, restoration, and improvement of the human Hair, and is now universally acknowledged to be the cheapest, and superior to all other preparations for the hair. It prevents it from falling off or turning grey, strengthens weak hair, produces a thick and luxuriant growth, cleanses it from scurf and dandriff, and makes it beautifully soft, curly, and glossy. In the growth of the Beard, Whiskers, Eyebrows, and Moustachios, it is unfailing in its stimulative operation. For children it is especially recommended, as forming the basis of a beautiful head of hair. Price 3*s.* 6*d.* and 7*s.*; Family Bottles (equal to four small), 10*s.* 6*d.*; and double that size, 21*s.* CAUTION.—On the wrapper of each bottle are the words, Rowlands' Macassar Oil, in two lines.—Sold by A. ROWLAND & SONS, 20, Hatton Garden, London, and by Chemists and Perfumers.

DO YOU WANT LUXURIANT HAIR, WHISKERS, &c.?—No other compound for the Hair has maintained such an enduring celebrity as EMILY DEAN'S CRINILENE. It is guaranteed to produce Whiskers, Moustachios, Eyebrows, &c., in a few weeks, and restore the Hair in Baldness, from whatever cause, strengthen it when weak, prevent its falling off, and effectually check Greyness in all its stages. For the nursery, Dr. Wilson says it is unrivalled.—Price 2*s.* per Package; sent post free, on receipt of 24 penny postage stamps, by Miss DEAN, 37 A, Manchester Street, Gray's Inn Road, London. Sold by every Chemist in the Kingdom.—"In one fortnight it produced a beautiful set of moustachios." H. ADAMS.—"It has prevented my hair falling off." J. HICKSON.—"It has quite checked the greyness that was coming on." Mrs. ELDER.

Beware of imitations under closely similar names.

TO NERVOUS SUFFERERS.

A RETIRED CLERGYMAN having been restored to health in a few days, after many years of great nervous suffering, is anxious to communicate to others the means of cure; he will therefore send (free), on receiving a stamped envelope, properly addressed, a copy of the prescription used.—Direct Rev. F. DOUGLASS 18, Holland Street, Brixton, London.

HOLLOWAY'S OINTMENT AND PILLS REMARKABLE FOR THEIR EFFICACY IN CURING BAD LEGS.—Mrs. Norman, of 25, Round Court, West Smithfield, was affected for upwards of nine years with a dreadful bad leg; the wounds in it were dreadful to behold, and she despaired of its ever being cured, as she had been under several medical men of great celebrity, but all failed in doing any good whatever. At last she determined on using HOLLOWAY'S OINTMENT AND PILLS, and these wonderful medicines soon effected a sound and perfect cure, to the great surprise of all her friends that had seen it.—Sold by all Medicine Vendors, and at Professor HOLLOWAY'S Establishments, 244, Strand, London, and 80, Maiden Lane, New York.

RUPTURES EFFECTUALLY CURED WITHOUT A TRUSS.—All sufferers from this alarming complaint are earnestly invited to consult or write to Dr. LESLIE, as he guarantees them relief in every case. His remedy has been successful in curing thousands of persons during the last twelve years, and is applicable to every kind of single and double rupture, however bad or long standing, in male or female of any age, causing no confinement or inconvenience in its use whatever. Sent post free to any part of the world, with full instructions for use, on receipt of 7*s.* 6*d.* in postage stamps, cash, or post-office order, payable at the General Post-office, to Dr. HERBERT LESLIE, 37A, Manchester Street, Gray's Inn Road, London. At home daily (except Sunday) from 11 till 4 o'clock. A Pamphlet of Testimonials sent post free on receipt of one postage stamp.

NO MORE PILLS NOR ANY OTHER MEDICINE.—FOR INDIGESTION (DYSPEPSIA), CONSTIPATION, NERVOUS, BILIOUS, AND LIVER COMPLAINTS, COUGH, ASTHMA, BRONCHITIS, CONSUMPTION, AND DEBILITY.

DU BARRY'S delicious REVALENTA ARABICA FOOD saves 50 times its cost in Medicine, and cures the above complaints and their consequences, such as flatulency, distension, acidity, heartburn, palpitation of the heart, nervous headaches, deafness, noises in the head and ears, pains at the pit of the stomach and between the shoulders, diarrhœa, dysentery, impurities and poverty of the blood, scrofula, asthma, dropsy, rheumatism, gout, nausea and sickness during pregnancy, after eating, or at sea; low spirits, spasms, cramps, epileptic fits, spleen, general debility, inquietude, sleeplessness, involuntary blushing, paralysis, tremors, dislike to society, unfitness for study, loss of memory, delusions, vertigo, blood to the head, exhaustion, melancholy, groundless fear, indecision. It is moreover the best food for infants and invalids generally, as it never purges or turns acid on the weakest stomach, nor interferes with a good liberal diet, but imparts a healthy relish for lunch and dinner, and restores the faculty of digestion, and nervous and muscular energy to the most enfeebled.

BARRY, DU BARRY & Co., 77, Regent Street, London.

A few out of 50,000 cures are here given:—

Cure No. 71, of Dyspepsia, from the RIGHT HON. THE LORD STUART DE DECIES, "I have derived considerable benefit from Du Barry's Revalenta Arabica Food, and consider it due to yourselves and to the public to authorise the publication of these lines. STUART DE DECIES."

From the DOWAGER COUNTESS OF CASTLESTUART.

Cure 52,612.—"Rosstrevor, County of Down, Ireland, 9, Dec. 1854.—The Dowager Countess of Castlestuart feels induced, in the interest of suffering humanity, to state that Du Barry's excellent Revalenta Arabica Food has cured her, after all Medicines had failed, of Indigestion, Bile, great nervousness and irritability of many years standing. This Food deserves the confidence of all sufferers, and may be considered a real blessing. Enquiries will be cheerfully answered."

Cure No. 49,832.—"Fifty years indescribable agony from dyspepsia, nervousness, asthma, cough, constipation, flatulency, spasms, sickness at the stomach and vomiting, have been removed by Du Barry's excellent food.

MARIA JOLLY, Wortham Ling, near Diss, Norfolk."

Cure 52,422. "Bridgehouse, Frimley, April 3d, 1854.

"I have suffered these 33 years continually from diseased lungs, spitting of blood, liver derangement, deafness, singing in the ears, constipation, debility, shortness of breath, and cough, and during that period taken so much medicine that I can safely say I have laid out upwards of a thousand pounds at the chemist's and doctor's. Indeed I was in utter despair, and never expected to get over it, when I was fortunate enough to become acquainted with your Revalenta Arabica, which, Heaven be praised, restored me to a state of health which I long since despaired of attaining. My lungs, liver, stomach, head, and ears are all right, my hearing perfect, and my recovery is a marvel to all my acquaintances.

"JAMES ROBERTS, Wood Merchant."

From the VENERABLE ARCHDEACON of ROSS.

No. 32,836.—"Three years excessive nervousness, with pains in my neck and left arm, and general debility, which rendered my life very miserable, has been radically removed by Du Barry's health restoring food. ALEX. STUART."

Cure 48,615. "Plymouth, May 9th, 1851.

"For the last 10 years I have been suffering from dyspepsia, headaches, nervousness, low spirits, sleeplessness, and delusions, and swallowed an incredible amount of medicine without relief. I am happy to say that your Food has cured me, and I am now enjoying better health than I have had for many years past.

"J. S. NEWTON."

Cure No. 180.—"25 years nervousness, constipation, indigestion, and debility, from which I have suffered great misery, and which no medicine could remove or relieve, have been effectually cured by Du Barry's Food in a very short time.

"W. R. REEVES, Pool Anthony, Tiverton."

No. 4208.—"Eight years dyspepsia, nervousness, debility with cramps, spasms, and nausea, have been effectually removed by Du Barry's health-restoring food. I shall be happy to answer any inquiries.

"Rev. JOHN W. FLAVELL, Ridlington Rectory, Norfolk."

No. 42,130, Major General King, cure of general debility and nervousness. No. 32,110, Captain Parker D. Bingham, R.N., who was cured of 27 years' dyspepsia in six weeks time. Cure No. 28,416, William Hunt, Esq., Barrister-in-law, 60 years' partial paralysis. No. 32,814, Captain Allen, recording the cure of a lady from epileptic fits. No. 26,419, the Rev. Charles Kerr, a cure of functional disorders. No. 24,814, the Rev. Thomas Minster, cure of five years' nervousness, with spasms and daily vomitings. No. 41,617, Dr. James Shorland, late surgeon in the 96th Regiment, a cure of dropsy.

No. 37,403, Samuel Laxton, Esq., a cure of two years' diarrhœa. Mr. William Martin, a cure of eight years' daily vomiting. Richard Willoughby, Esq., a cure of many years' biliousness.

No. 58,034.—"Grammar School, Stevenage, December 16, 1850. "Gentlemen,—We have found it admirably adapted for infants. Our baby has never once had disordered bowels since taking it.

"R. AMBLER."

"59, Union Street, Third District, New Orleans, Mar. 13, 1855.

"Dear Sir—Since 1838 I had been afflicted with a complaint that neither I nor my physician could qualify. It first began by an excessive thirst, so that I was fain to drink daily from 30 to 40 tumblers of water, the greatest thirst being during the digestive process. A strange feeling above the fundament followed that unusual thirst. It came on with intolerable itchings, and next as if an edged tool was cutting into it. Afterwards as if a full-grown crab's claw were steadily inching at me. These symptoms were followed by colic, and finally by a diarrhœa. Originally these paroxysms came on yearly; after a while, several times in the course of the year; and for some years back almost every month, until at last every week. So that for seventeen years I have been labouring under an insufferable affliction, deprived of sleep, and so dizzy at times that I could not help myself; my stomach would fail me, and I thus became a helpless enervated invalid. At last on the 15th of June, 1854, I was taken down with an alvine flux and killing pains in the bowels. Often as I went to bed at night I thought I should never see the morning. My medical attendant and friend, in whom was all my trust, concluding that he could do nothing to alleviate my sufferings, (I thought so, at least), under colour of being himself unwell, sent me to one of his colleagues, whose attendance proved as unsuccessful; all the remedies prescribed failing to afford me any relief. It was at this stage of my disease that, on the 5th of September last, I luckily met one of my friends, who told me that Mr. J. B. Monier had passed through the same ordeal, and had been radically cured by Du Barry's Revalenta Arabica. Thereupon I immediately began to make use of it, and soon after felt relieved; and the extraordinary change for the better I have gradually experienced since, owing to that excellent farina, induces me to believe that I am completely cured. However as mine was a chronic disorder, I still keep taking the Revalenta, and will do so for some time yet, to insure a permanent return to health. Hoping that this statement may serve the cause of humanity, I cheerfully make it, and remain, yours respectfully, F. B. BERNARD,"

Commercial Abstract Clerk in the Collector's Office.

London: Groombridge & Sons, 5, Paternoster Row, and at the Office of the "Family Economist."—Sold by all Booksellers.

ELEVEN THOUSAND COPIES HAVE BEEN SOLD OF
THE DICTIONARY of DOMESTIC MEDICINE & HOUSEHOLD SURGERY. By Spencer Thomson, M.D.

"A good and safe Book on Domestic Medicine; should form a portion of the library in every family." "No emigrant should leave home without it." "All residing at a distance from medical advice should possess it." "In emergencies it is invaluable." Such are the opinions of the Reviews. It is profusely illustrated with wood engravings. It is arranged in the alphabetical form; "altogether," as the *Athenæum* remarks, "it comes nearer to the standard of what such a book should be than any we have yet seen."

*** Order Thomson's Medical Dictionary, price 7s., of any Bookseller in Town or Country.

Groombridge & Sons, Publishers, 5, Paternoster Row, and at the Office of the "Family Economist."

Second Edition, price 5s., elegantly bound in cloth,
WANDERINGS among the WILD FLOWERS; How to See and how to Gather them. With Two Chapters on the Economical and Medicinal uses of our Native Plants. By Spencer Thomson, M.D., Fellow of the Botanical Society of Edinburgh: Author of "A Dictionary of Domestic Medicine and Household Surgery." Illustrated with 170 Engravings.

"A pretty volume devoted to Botany. The author has evidently a love of plants, and throws a sufficient amount of feeling into his descriptions of the parts of plants, to render them less dry and repulsive than such are usually found. As an introduction to Botany in this country, we can recommend Dr. Thomson's Wanderings among the Wild Flowers."—*Athenæum.*

"A book of remarkable beauty."—*Christian News.*

Groombridge & Sons, 5, Paternoster Row, and at the Office of the "Family Economist."

April, 1855.

Longman, 66, Cheap-side, London; Editor's Offices (Offices for Patents), 47, Lincoln's Inn Fields.

BINFIELD ROAD, STOCKWELL, SURREY.
TO BE LET on Lease, the whole or part of a desirable NURSERY GARDEN, walled round, Cottage containing five convenient rooms on the ground floor, three Greenhouses, and two Sheds.—Particulars of Mr. Thompson, 3, Finsbury Chambers, Blomfield Street, London.

SOUTH WALES, CARMARTHENSHIRE.
Desirable Farm and Residence.
TO BE LET, and entered upon at Michaelmas next, a most desirable FARM, called Tyrydail, with a Residence, adapted for a family of respectability. The Farm Buildings are of a very superior description, arranged on the most improved plan, with Water Power, and about 300 Acres of excellent Land, in a ring fence. A Railroad having a Station on the land passes through the Estate; opening the whole of the mineral districts of South Wales as a market for produce.—For particulars or to treat, apply to Mr. C Bishop, Solicitor, Llandovery, South Wales.

CONNEMARA, IRELAND.
TO BE LET, for a term of years and entered upon the 1st of May next, the FARM of SHANBOOLARD, in the parish of Ballinakill and county of Galway. It consists of about 264 statute acres of Arable, Pasture, and Bog Land, on which a considerable sum has already been spent in permanent improvements. The Farm would be let at a Corn Rent, and, if required, on a long Lease—the rent in proportion. The Farm is bounded on the north by Ballinakill Harbour, affording good sea-bathing; and on the south by Ballinakill Lough, noted for its Brown Trout, and commands extensive views of the Achill and Connemara Mountains. It is within eight English miles of the market-town of Clifden.—For particulars apply to Mr. Edward Whitwell, Letterfrack, Galway.

HIGHLANDS OF PERTHSHIRE.
TO BE LET, CASTLE MENZIES and SHOOTINGS; the House, as furnished, affording ample accommodation for a numerous family and establishment, along with 10,000 acres of Muir and Low Ground Shootings. The stock of Game, which has been strictly protected and well preserved, will be found good, healthy, and of all the usual descriptions; and Salmon Fishing is to be had along the banks of the Tay and Lyon, which bound the property for six miles. The post passes the gate, and from Aberfeldy (two miles distant) coaches proceed in all directions. Supplies are easily procured. The climate is exceedingly good; and the place would be equally suitable as a permanent residence or as a shooting quarter.—Apply to Archibald Campbell, Camserney Cottage, by Aberfeldy.

HOUSE AND SHOOTING.—ISLAND OF MULL.
TO BE LET, CARSAIG HOUSE, beautifully situated on the South Coast of Mull. It contains three public rooms, seven bed-rooms, three dressing-closets, and a bath, ample accommodation for servants, and is well supplied with water. The tenant may have accommodation for two or three horses, and may have a pasture for two cows, or be supplied with dairy produce. There is a good Vegetable Garden. The Shooting extends over about 5000 acres, which have been very little shot over for many years. Other 4000 or 5000 acres adjacent may be obtained. The Game consists of grouse, black game, partridge, hare, and rabbits, and occasionally red deer. The Sea Fishing is excellent, and there are two small Trouting Streams on the Estate. There is a commodious Quay and Landing-place, and Steam-boats pass the house in the summer three times a-week.

COUNTY OF KILDARE.—VALUABLE ESTATE.
TO BE SOLD, the HOUSE, DEMESNE, and LANDS of NEWBERRY, in the Parish of Carberry, and County of Kildare, consisting of 580 statute acres, held in fee farm. The House is large and commodious, with attached and detached Offices, Water laid all over the House, an excellent Walled Garden, and handsome Shrubberies and Plantations. The Lands have been thorough drained, are of prime quality, all under Grass, and in high condition, having been for the last 23 years, as they are at present, in the occupation of the proprietor. The fields are well watered, fenced, and sheltered with good hedges and valuable hedge-row Timber; also some fine old ornamental Timber, and a handsome piece of water in front of the house, with a Mill and Miller's House, and good water power, on the public road side. Upon these Lands there is an abundant supply of the best shell marl, limestone, sand, and gravel. Newberry Hall is 24 miles from Dublin, 3 miles from the large Market Town of Edenderry, 4 from the Enfield Station of the Great Midland Railway, 10 from the Curragh, and 2 from the Ticknevin Station on the Grand Canal. The Kildare Hounds hunt the county within 4 miles. The Church, Post Office, Dispensary, and Court House are in the Village of Carberry, immediately adjoining the Demesne, and the Roman Catholic Chapel about a statute mile distance. A purchaser can obtain immediate possession of the entire.—For further particulars, and order to view, apply to Messrs. H. Wallace & Co., Solicitors, 20, North Great George's Street, Dublin; Victoria Street, Belfast; or Downpatrick.

SHORES OF THE MEDITERRANEAN.
TO BE SOLD, the CHATEAU ST. GEORGES, at CANNES, South of France, one of the most delightful MARINE RESIDENCES IN EUROPE, with or without its Elegant and Appropriate Furniture, all in perfect order, and fit for the immediate reception of any Nobleman or Gentleman's Family. The Chateau is in the Palladian style of architecture, fitted up with every English comfort, and in a beautifully warm and dry climate, where Sea-bathing may be continued all the year with the greatest convenience. The Gardens on the south side of the Chateau sloping down to the Sea, with doors open on to the beach. On the north side the property is bounded by the grande route from PARIS to NICE, from which latter town it is distant about 20 miles south-west. The Chateau is only a few minutes walk from the seat of Lord Brougham, and about one mile west from the town of Cannes, from which Port there are three Steam-boats weekly to and from Marseilles, and four Diligences to and fro daily between Paris, Marseilles, and Nice.

The Chateau is on an elevated terrace, rising up from the Orange Garden, and within 200 yards of the sea-shore. It was originally built by the late Lieut.-Gen. Sir Herbert Taylor, but has since received considerable additions and embellishments. The terrace floor, occupying the south front, consists of splendid double Drawing-rooms, Library, Dining, and Breakfast Rooms, all *en suite*, and opening on to a Doric colonnade of hewn stone, and descending by steps to a beautiful gravelled terrace 250 feet long, facing the "Blue Mediterranean." From the Drawing-room floor a splendid marble stair-case leads to a first and second floor of elegant Bed-rooms, of which there are on the two floors nine to the south front, two to the east, and six to the north, besides six servants' rooms in the attics. Excellent Porter's Lodge at the entrance gate; Poultry-houses, six-stall Stables, large Coach-houses, and splendid Flower and Kitchen Gardens, and a great variety of shady and ornamental walks amongst the natural woods of Cork Trees, Fir, Myrtle, Arbutus, and Maritime Stone Pines: and amongst the granitic rocks are growing the Cactus, Flowering Aloe, and other tropical plants in their natural state—the great variety of level and cultivation giving the idea of a much larger extent of ground. The whole is enclosed with walls, but not obstructing the fine view of the magnificent scenery around, and forms a parallelogram containing about 30,200 square yards, or about seven English acres. The price of the whole is 7500*l.* without Furniture, which may also be had at a valuation, and immediate possession if desired.

For viewing plans and further particulars, apply to Messrs. Prichard & Collette, 57, Lincoln's Inn Fields, London, Solicitors.

TO SPORTSMEN, STOCK-FARMERS, ETC.
TO BE SOLD, a range of nearly 6000 acres of easily-travelled GROUSING GROUND, not surpassed in the Lowlands of Scotland for its sporting qualifications, and watered by several small Trouting Streams, having also a comfortable Small Lodge, all situated in the midst of several strictly preserved estates, in one of the most southerly counties, and of easy access from England or elsewhere, from being within five miles of a seaport, as well as forming a very improving and easily-managed investment as a Stock Farm for a moderate capital. The proprietor is ready to treat for a Sale of the same. Apply, free, to No. 639, N.B.A.O., Edinburgh.

TO SEEDSMEN AND OTHERS.
TO BE SOLD, the Goodwill of a large Wholesale and Retail SEED TRADE, together with the Plant and a 10 years' Lease of the Premises, which have facilities for doing the largest trade, and are on a business site unsurpassed in the three kingdoms. To a London or Edinburgh house desirous of establishing a branch at which they might vend large bulks this affords a rare opportunity—as it does to a party desirous to commence business on a sure footing.—Apply (in the first instance by letter only) to James Adolphus Moore, Esq., 2, Tenterden Street, Hanover Square, London.

TO BE SOLD, an ornamental GREENHOUSE or AVIARY (entirely new), consisting of cast-iron Pilasters, Gutters, and ornamental and wrought-iron Sashes and Dome Roof, ready for glass.—May be seen, erected, on inquiry of Messrs. Edward T. Bellhouse & Co., Eagle Foundry, Hunt Street, Garratt, Manchester.

GOLDEN-SPANGLED HAMBURGH EGGS (fresh) from First-rate Birds, 10*s.* per set of 13.—Apply to Mr. J. Compton, Porchester, Fareham, Hants.

DORKING BLUE MOTTLED FOWLS' EGGS, 12*s.* per dozen. Took first Prize at Brighton Exhibition of three counties, 1854.—Address Mr. Ed. Henden, Beehive Inn, Dorking, Surrey.

TO BE SOLD, BUFF COCHIN CHICKENS, from first class Prize Birds, Brahma Pootra Chickens, from imported American Prize Birds, and Spanish Chickens. Also some very good one-year-old Birds of the above descriptions. Wire, Game, and Poultry Netting, Poultry Hurdles, Hen-houses, Chicken Coops, Flower Stands, and Trainers, Garden Arches, and every kind of Wire Work, useful and ornamental.—T. H. Fox's, City of London Wire Works, 44, Skinner Street, and 6 & 8, Snow Hill. Illustrated Catalogues forwarded post free.

Sales by Auction.

FANCY POULTRY.—PERIODICAL SALE.
MR. J. C. STEVENS will Sell by Auction, at his Great Room, 38, King Street, Covent Garden, on TUESDAY, May 1, at 12 o'clock precisely, Poultry of choice quality, including first-class Spanish from the yard of Mr. Timothy Mason, Gold and Silver Hamburghs from a celebrated amateur in Yorkshire, Gold-laced, White and Black Bantams, Dorkings, Cochins, and Brahmas.—May be viewed on the morning of Sale, and Catalogues had by enclosing a stamped directed envelope to Mr. J. C. Stevens, 38, King Street, Covent Garden, London.

ORCHIDS ESTABLISHED AND IMPORTED PLANTS.
MR. J. C. STEVENS will Sell by Auction, at his Great Room, 38, King Street, Covent Garden, on TUESDAY, May 8, at 1 o'clock precisely, a collection of the best ORCHIDS from Columbia and Mexico, including established plants of Odontoglossum, Pescatorei, nebulosum, maculatum, and Reichenhaimi, Uropedium, Lindeni, &c. Also an importation received by last mail steamer from the Brazils, including fine Plants of Lælia purpurata and Bryssiana (new), Cattleya amethystina, bulbosa, Leopoldi lobata, mutabilis, Harrissoni and tigrina.—May be viewed on the morning of Sale, and Catalogues had of Mr. J. C. Stevens, 38, King Street, Covent Garden, London.

TO GENTLEMEN, FLORISTS, AND OTHERS.
MESSRS. PROTHEROE and MORRIS will Sell by Auction at the Mart, Bartholomew Lane, on THURSDAY, May 3d, at 12 o'clock, a first-rate collection of CARNATIONS, PICOTEES, and PINKS, from a celebrated grower; choice DAHLIAS, in dry roots; PÆONIES, VERBENAS, FUCHSIAS, AZALEA INDICA, GERANIUMS, HEARTSEASE, ERICAS, &c.—On view the morning of Sale. Catalogues had at the Mart; and of the Auctioneers, American Nursery, Leytonstone, Essex.

TULIPS IN BLOOM
MESSRS. PROTHEROE and MORRIS will sell by Auction, without the least reserve, on MONDAY, May 28, at 1 o'clock precisely, the ENTIRE COLLECTION of TULIPS in BLOOM of Mr. John Edwards, and now growing at the Paradise Nursery, Hornsey, and Seven Sisters Road, Holloway, Middlesex, where by the kind permission of Mr. Robert Parker, they may from time to time be seen. The bed is 200 rows in length, and contains over 2000 full sized first class Blooming Bulbs, including most of the show flowers extant, all of the finest strain, and collected during the last 12 years at a cost exceeding 1000 guineas.

Catalogues may be had for two postage stamps of Mr. R. Parker, as above; of Mr. Turner, Royal Nursery, Slough; Mr. J. Keynes, Salisbury; Mr. Wood, the Coppice, Nottingham; Mr. E. S. Dodwell, Derby; Mr. Lightbody, Falkirk, N.B.; Mr. Slater, Cheetham Hill, Manchester; at the Office of this Paper; and of the Auctioneers, American Nursery, Leytonstone, Essex.

BLACKHEATH.
To Noblemen, Gentlemen, Nurserymen, and Others.
8000 BEDDING AND OTHER GREENHOUSE PLANTS.
MESSRS. PROTHEROE and MORRIS are instructed to sell by Auction, without reserve, in the Lecture Hall adjoining the Blackheath Station of the North Kent Railway, on THURSDAY, May 10, at 1 o'clock, a choice collection of Fancy and other Pelargoniums, Tom Thumb and fine Scarlet Geraniums in varieties, Verbenas, Heliotropes, Calceolarias, Petunias, Fuchsias, Lobelias, Pentstemons, Phlox, Dahlias; also selected assortment of Azalea indica, Ericas, Epacris, Aphlexis, Leschenaultias, Acacias, &c.—May be viewed one day prior, and morning of sale; Catalogues may be obtained at the place of sale: of Mr. Drouet, Crown Inn, Tranquil Vale, Blackheath; of the principal Seedsmen in London; and of the Auctioneers, American Nursery, Leytonstone, Essex.

ONGAR, ESSEX.
To Gentlemen, Florists, and Others.
MESSRS. PROTHEROE and MORRIS will Sell by Auction, on the Premises, the Cottage, Marden Ash, Ongar, Essex, on TUESDAY, May 1st, at 12 o'Clock, without reserve, in consequence of the proprietor leaving the neighbourhood, the whole of the GREENHOUSE PLANTS, comprising fine Azalea Indica, Camellias, Epacris, Roses in pots, Ericas, &c.; an assortment of Bedding Plants, including Tom Thumbs and other scarlet Geraniums, Pelargoniums, Fuchsias, Verbenas, Petunias, Heliotropes, Calceolarias, &c. Also a newly erected greenhouse complete, several capital 2 and 3-light boxes, a modern summer-house, rustic flower baskets, seats, tables, ornamental wire flower-stands; a capital iron roller, garden engine, barrow, garden tools; syringe, with the fowls and chickens from a choice breed, and sundry effects. May be viewed the day previous and morning of sale. Catalogues may be had on the Premises; of the principal Seedsmen in London; and of the Auctioneers, American Nursery, Leytonstone, Essex.

HORTICULTURAL BUILDING

AND

HEATING BY HOT WATER.

AT THE LOWEST PRICES

CONSISTENT WITH GOOD

MATERIALS & WORKMANSHIP

GRAY & ORMSON, DANVERS STREET, CHELSEA, LONDON.

GRAY AND ORMSON, Danvers Street, Chelsea, having had considerable experience in the construction of Horticultural Erections, which, for elegance of design, good materials, and workmanship, combined with economy and practical adaptation, cannot be surpassed by anything of the kind in the country, are in a position to execute orders on the lowest possible terms.

G. & O. have been extensively employed by the Nobility, Gentry, and London Nurserymen; and they can with the greatest confidence give the most satisfactory references to all by whom they have been favoured with orders. Their Hot-water Apparatus is also constructed on the most approved and scientific principles, for all purposes to which the application of Heating by Hot Water can be made available.

HORTICULTURE IN ALL ITS BRANCHES.

JOHN WEEKS & Co., King's Road, Chelsea,

HOTHOUSE BUILDERS.

THE NOBILITY AND GENTRY about to erect Horticultural Buildings, or fix Hot-water Apparatus, will find at our Horticultural Establishment and Hothouse Works, King's Road, Chelsea, an extensive variety of Hothouses, Greenhouses, Conservatories, Pits, &c., erected, and in full operation, combining all modern improvements, so that a lady or gentleman can select the description of House best adapted for every required purpose.

The HOT-WATER APPARATUS, which passes through all the Houses and Pits, affording both top and bottom heat, is in constant operation and particularly worthy of attention.

Many of the Houses and Pits are of wide and lofty dimensions and together equal in length 1000 feet. They are all effectually heated by *one boiler*, which, during the severe winter months does not cost in labour and fuel more than 3*s*. 8*d*. per day, and the apparatus is so arranged that each House or Pit may be heated separately and to the required temperature. The splendid collections of Stove and Greenhouse Plants are also in the highest state of cultivation, and for sale at very low prices. Also a fine collection of strong Grape Vines in pots, from eyes, all the best sorts.

Plans, Models, and Estimates of Horticultural Buildings and Catalogues of Plants, Vines, Seeds, &c., forwarded on application to JOHN WEEKS & Co., King's Road, Chelsea, London.

HOTHOUSES, CONSERVATORIES, FRAMES & LIGHTS FOR PITS, CUCUMBER & MELON BOXES & LIGHTS.

JAMES WATTS, HOTHOUSE BUILDER, 8, Clarence Place, Old Kent Road, London.

Green and Hothouses, 9, 10, 11, 12, 13, and 14 feet wide, any length, from 16 to 100 feet. Frames and Lights for Pits, 6 ft., 7 ft., 7 ft. 6 in., 8 ft., and 8 ft. 6 in. wide, any length, from 12 to 100 feet. Upwards of 200 Cucumber and Melon Boxes and Lights, from 4 ft. by 3 to 10 ft. 6 in. by 5 ft. 6 in., kept ready glazed with stout sheet glass, painted four times, complete, ready for immediate use, all made of best material, packed and sent to all parts of the kingdom.—Reference may be had to the Nobility, Gentry, and the Trade, in most of the counties in England.

HORTICULTURAL SOCIETY OF LONDON.—The FIRST SUMMER MEETING will take place at the Society's House, 21, Regent Street, on TUESDAY, May 8, from 12 to 5 P.M.

HER MAJESTY'S COMMISSIONERS FOR THE EXHIBITION OF 1851 having granted the use of the gardens behind GORE HOUSE and GROVE HOUSE to the HORTICULTURAL SOCIETY, for the Garden Exhibition on WEDNESDAY, May 16, Notice is hereby given that Tickets, price 5*s*. each, are issuing at 21, Regent Street, till TUESDAY, May 15. On the day of Exhibition Tickets will be only procurable at Gore House, and at the rate of 7*s*. 6*d*. each.

ROYAL BOTANIC SOCIETY, REGENT'S PARK.—The FIRST EXHIBITION this season of PLANTS, FLOWERS, and FRUIT, will take place on WEDNESDAY next, May 9. Tickets of admission to be obtained at the Gardens only, by orders from Fellows or Members of the Society, price 5*s*., or on the day of the Exhibition, 7*s*. 6*d*. each.

Gates open at 2 o'clock.

ROYAL BOTANIC SOCIETY, REGENT'S PARK.—The following EIGHT BOTANICAL LECTURES are to be delivered in the Museum, at 3 o'clock, on the FRIDAYS in May and June.

By Dr. EDWIN LANKESTER.

May 11. On General Physical Conditions that influence the Life of Plants.
18. On Conditions of the Soil that influence the Distribution of Plants.
25. On the Forms of Plants characteristic of particular districts of the Earth's surface.
June 1. On the Distribution of Plants used as Medicines, Food, and Luxuries, or employed in the Arts and Manufactures.

By Professor ROBERT BENTLEY.

June 8. On Vegetable Textile Substances.
15. On Materials used for Paper.
22. On Tanning and Dyeing Materials.
29. On Gums, Resins, and Gum-resins.

Visitors are admitted to the Lectures by Tickets for the Course at one Guinea each person, or a Member of the Family of a Fellow of the Society at Half-a-Guinea, to be obtained at the Gardens. The privilege of the Ivory Tickets does not extend to the Lectures.

J. DE C. SOWERBY, Sec.

CRYSTAL PALACE.—SEASON TICKETS for the ensuing year, available from the 1st May, 1855, to the 1st April, 1856, are now issued, price One Guinea each. These tickets entitle the holders to admission to the Palace and Park whenever they are open to the Public; also to the exclusive privilege of admission at the Grand Horticultural and Floricultural Fête, to be held on Saturday, the 2d June, as well as on the subsequent occasion of playing the whole of the Grand Fountains and Cascades for the first time.

They may be obtained at the Palace; at the Office, 3, Adelaide Place, London Bridge; at the Offices of the Brighton Railway, London Bridge, and 43, Regent's Circus, Piccadilly; at Mitchell's Library, Bond Street; and Sams's Library, St. James's Street. Remittances from the country and Post-office Orders must be payable to George Fasson.

(By Order.)

Crystal Palace, May 5. G. GROVE, Secretary.

GREAT NATIONAL EXHIBITION OF FLORAL AND HORTICULTURAL PRODUCE.

THE CUMBERLAND FLORAL AND HORTICULTURAL SOCIETY OF CARLISLE will hold a GRAND EXHIBITION of FLOWERS, FRUITS, VEGETABLES, &c., in spacious marquees and tents (engaged for the purpose) on the 24th, 25th, and 26th of July (open to the United Horticultural Society's Exhibition, when 200*l*. will be awarded in Prizes.

Schedules of Prizes and every information may be obtained on applying to the Secretary, either personally or by letter. By order of the Council,

JOHN PATTERSON, Secretary.

English Street, Carlisle.

ENROLLED AGREEABLY TO ACT OF PARLIAMENT.

UNITED GARDENERS' BENEFIT SOCIETY, Waterloo Arms, Camberwell, Surrey. Instituted 1839.

This Society, established for Gardeners only under 35 years of age, has proved for 16 years the accuracy and soundness of the principle upon which it is founded, namely, the highest amount of benefits to be received by its Members in Sickness, Superannuation, and Mortality, for the smallest amount of contribution consistent with stability and permanence. The accounts are always open to the inspection of all the members, who have also a control of the expenditure of its funds; it is therefore incumbent on all, by a small monthly contribution, to provide against the casualties of life, from which none are exempt, by enrolling themselves in a Society of this nature, which guarantees 12*s*. per week in sickness; 3*s*. and 4*s*. per week superannuation; 10*l*. at the death of a member, and 8*l*. member's wife, for the small contribution of 2*s*. 3*d*. per month.

Camberwell Green, Surrey. CHARLES STUNELL, Secretary.

GOOD SWEDE SEED.

SUTTON AND SONS *have good new Ashcroft, Skirving's, and other Swede Seeds, true to their kinds, warranted all of last year's growth.* Price, in large or small quantities, 2*s*. per lb. Large quantities CARRIAGE FREE. Remittances or references required from unknown correspondents.

Address, SUTTON & SONS, Seed Growers, Reading.

THE PERENNIAL WHITE CLOVER.—This Clover is included in all Messrs. Sutton's mixtures for Permanent Pasture, and is very superior to the common White Clover; it may be purchased separately, price 1*s*. 6*d*. per pound.

Address—SUTTON & SONS, Seed Growers, Reading.

SUTTON'S LARGE YELLOW GLOBE MANGOLD WURZEL, FROM SELECTED ROOTS, QUITE HARDY.—Seed of this fine large Mangold Wurzel may be obtained genuine of Messrs. SUTTON, price 1*s*. per lb., or 5*l*. per cwt.; other sorts cheaper. Early orders are requested and recommended, as the stock is limited.—Address,

JOHN SUTTON & SONS, Seed Growers, Reading, Berks.

MORTON'S YELLOW GLOBE MANGOLD.—*From Seed grown from the original stock of J. C. Morton, Esq., the Editor of the* AGRICULTURAL GAZETTE. 1*s*. 6*d*. *per lb.*

WILLIAM E. RENDLE & Co., SEED MERCHANTS, Plymouth.

WHITE BELGIAN CARROT, 2*s*. *per lb., or much cheaper by the cwt.*

WILLIAM E. RENDLE & Co., SEED MERCHANTS, Plymouth.

TRUE GUERNSEY PARSNIP.—*This is a large and superior sort, and can be strongly recommended. The Subscribers have just imported a choice lot of Seed from Guernsey, and can supply it at 2s. per lb.*

WILLIAM E. RENDLE & Co., SEED MERCHANTS, Plymouth.

TO THE SEED TRADE.—TURNIP SEEDS, &c.

Skirving's or Liverpool Swede	Orange Globe Wurzel
Laing's	Broccoli, of sorts
White Globe Turnip	Fairbeard's Nonpareil Peas
Green	Cole's Crystal White Celery.
Red Tankard	

W. J. EPPS can with confidence offer the above (not large quantities), having been grown from the best selected stocks possible.—Prices sent on application.

Seed Establishment, High Street, Maidstone, May 5.

NEW PLANTS.

A. VERSCHAFFELT, NURSERYMAN, Ghent (Belgium), is now sending out his following New Plants:

Achimenes Ambroise Verschaffelt	8*s*. 0*d*.
" Docteur Flopf	8 0

FLOWERING PLANTS.

F. AND A. SMITH beg to offer FLOWERING PLANTS of the following (in quantities to the trade):—Geraniums, Fuchsias, Verbenas, Heliotropes, Calceolarias, Hydrangeas, Roses, Cactus, Ericas, Burchellia, Kalosanthus, Neriums, Scarlet Geraniums, &c. Prices on application. The Plants are stocky and in good condition: an inspection solicited.—Dulwich, Surrey.

500.000 FLAT-POLE OR DRUM-HEAD CABBAGE PLANTS.

THOMAS MOORE, NURSERY AND SEEDSMAN, Fore Street, Kingsbridge, Devon, begs to call attention to his large Stock of CABBAGE PLANTS, which will be ready in May and June. They are a superior late sort, and raised from seed of his own saving.

PINUS BENTHAMIANA—(TRUE).

MESSRS. VEITCH AND SON having succeeded in raising from Seed a number of this beautiful Pine, which is, doubtless, the finest of the long-leaved Californian kinds, and has proved to be perfectly hardy, are now enabled to offer good established plants on the following terms:—A single plant, 10*s*. 6*d*.: six plants, 50*s*.; twelve plants, 84*s*. Prices to the trade in proportion to the quantity taken, given on application.

Exotic Nurseries, Chelsea and Exeter.—May 5.

NEW AND RARE PLANTS.

MESSRS. VEITCH AND SON respectfully announce that their DESCRIPTIVE LIST of NOVELTIES for this season is now ready for distribution, and will be forwarded on application.—Nurseries, Exeter and Chelsea, May 5.

A GENERAL CATALOGUE OF PLANTS, TREES, AND SHRUBS offered for sale by HUGH LOW & Co., Clapton Nursery, London, is now ready to be sent free by post to any person applying for the same.

T. F. WINSTANLEY'S BEDDING PLANT LIST is now ready, and can be had on application, or free by post.—28, Market Place, Manchester.

BEDDING AND OTHER PLANTS.

F. AND A. SMITH'S Descriptive LIST of the undermentioned is now ready, and may be had, post free, on application:—Antirrhinums, Verbenas, Fuchsias, Scarlet Geraniums, Calceolarias, Petunias, Heliotropes, Pentstemons, Chrysanthemums, Mimulus, Salvias, Lobelias, &c. Climbers in variety, also a miscellaneous Collection of Greenhouse Plants. They have now in bloom Cytisus racemosus, Roses, Verbenas, Fuchsias, spotted Calceolarias, Erica Hybrids, Cactus, Geraniums, &c. The Trade supplied.—Dulwich, Surrey, May 5.

WILLIAM MASTERS AND SON, LANDSCAPE GARDENERS, Exotic Nursery, Canterbury.

WILLIAM BARRATT, LANDSCAPE GARDENER, Wakefield.

*** Plans and Estimates furnished.

ROGERS'S SEED DEPOT AND GARDENERS' REGISTRY OFFICE, Clock House, Chelsea. Seeds of the "THREE GEMS OF THE SEASON," adapted for beds or pot culture, and all the newest and best things supplied reasonably.

TO BE SOLD CHEAP, price 60*l*., a small private Collection of ORCHIDS (180 Plants).—Apply to Messrs. FRASERS' Nurserymen, Lea Bridge Road, Leyton, Essex.

DWARF FRENCH BEANS can be had in any quantity.—Apply to J. G. WAITE, Seed Merchant, 181, High Holborn, London.

MESSRS. JOHN WEEKS AND CO. have now ready a well grown stock of BEDDING PLANTS, selected from the best existing varieties, and at most reasonable prices.

Horticultural Establishment, King's Road, Chelsea; and at Frankfort-on-the-Maine.

CHEAP DAHLIAS AND VERBENAS.

H. LEGGE is sending out all the leading Sorts of last Season, 9*s*. to 12*s*. per dozen; Older Varieties, 3*s*. to 4*s*. do. Catalogues can be had on application.

Marsh Side, Edmonton.

BOSSOM'S CHAMPION OF ENGLAND CELERY.

THE finest Celery yet introduced, beautifully white, very crisp and solid, and withstands a greater amount of frost than any other known variety; it has been blanched in the ground 3 feet.—To be obtained of T. F. WINSTANLEY, Seedsman, 28, Market Place, Manchester, price 2*s*. 6*d*. per packet; prices to the trade on application.

SUPERB HOLLYHOCKS, SEEDS, ETC.

WILLIAM CHATER begs to offer packets of seed, consisting of 20 varieties, from his best Show Hollyhocks, at 5*s*.; 12 varieties, 2*s*. 6*d*.; and from good double sorts, 1*s*.

Superior Quilled German and French Asters, in 12 varieties, mixed, 1*s*. per packet; separate, 2*s*. Fine Quilled African Marigolds, 6*d*. per packet.—Saffron Walden Nurseries.

BANKS' SEEDLING FUCHSIAS.—1855.

(FOR FULL DESCRIPTION SEE FORMER ADVERTISEMENTS, AND ON APPLICATION).

W. J. EPPS has much pleasure in stating that the above Fuchsias have been proved to be the finest that have been raised by that celebrated grower E. Banks, Esq., Deal. Early orders are solicited. The set of six, 2*l*. 2*s*. The usual discount to the trade.—Bower Nurseries, Maidstone.

NEW SCARLET VERBENA.—MRS. WOODROFFE.

ARTHUR HENDERSON AND CO. are now sending out this fine new VERBENA; particulars of which may be seen in their advertisement in the *Gardeners' Chronicle* of March 31. The usual discount to the Trade.

☞ This Verbena is the same as "Conqueror," one offered by another firm.—Pine-apple Place, Edgware Road, London.

MAY'S MAGNUM BONUM LETTUCE is by far the largest, sweetest, and crispest Lettuce known, in proof of which we possess numerous letters received from parties who had it last season. The addresses of the writers can be had on application. Only a few packets remaining at 1*s*. each.—HENRY MAY, the Hope Nurseries, near Bedale, Yorkshire.

THE FINEST CRIMSON DAHLIA OF THE SEASON, ABLITT'S "INCOMPARABLE."—It is the brightest of its class, and full size. Perfect outline, very deep, full, compact, and symmetrical; and for a flower so beautifully cupped, well up, and good in the centre.—Mr. GLENNY'S *Opinion.*

☞ Strong healthy plants, at 10*s*. 6*d*. per pair, may now be had of Mr. BARNES, Stowmarket; Mr. TURNER, of Slough; and of EDWARD ABLITT, Onehouse, Stowmarket, Suffolk.

M'ADAM AND CO.'S BLIGHT COMPOSITION, now universally used, is sold in packets (with full directions) at 3*s*. 6*d*. each, sufficient to make 24 gallons of liquid wash. No Grape, Peach, or Plant grower should be without this invaluable remedy (see *Gardeners' Chronicle*, May 27, June 10, July 1, &c.)—Agent, JOHN HAYNE, 8, Liverpool Street, City, London. Paid orders forwarded.

SKIRVING'S IMPROVED TURNIP SEEDS.

W. SKIRVING, Queen Square, Liverpool, begs to acquaint his friends and the public that he has fixed the price of his TURNIP SEEDS for the season, as follows:—

SKIRVING'S IMPROVED SWEDE TURNIP, at 1s. 9d. per lb.

IMPROVED PURPLE-TOP YELLOW BULLOCK TURNIP, at 1s. 3d. per lb.

All other kinds of Turnip and Agricultural seeds in general, of the most select description, at moderate prices. A remittance, or reference from unknown correspondents, is respectfully requested to accompany orders. W. S. has no agent in town or country.

Liverpool, May, 1855.

CHOICE BEDDING-OUT PLANTS,

And to those about Permanently Replenishing the Flower Garden.

YOUELL AND CO. beg to submit the following List of desirable PLANTS, suitable for the above purpose. Carriage paid on all Orders of 2l. and upwards to any distance within 150 miles of the Nursery, and good Plants added to compensate for this charge on packages of less value:—

EDWARD TILEY, Nurseryman, Seedsman, and Florist, 14, Abbey Church Yard, Bath, Somerset.

NEW PLANTS.

MESSRS. WILLIAM ROLLISSON AND SONS are now prepared to offer—

BEGONIA SPLENDIDA.—This exquisite plant was discovered in Java by our collector, Mr. John Henshall, during his researches in the Indian Archipelago. It is an extremely beautiful plant of ornamental foliage, the stems and leaves of which are covered over with a bright crimson hirsute down: altogether it presents so striking an appearance, that it is alone much to be desired for its magnificent foliage, for which we are now offering it, the plant not having yet flowered in this country. 42s. to 63s.

RHODODENDRON GRISEWOODIANUM.—This is a most superb large white free-blooming variety, beautifully tinted with blush, and distinctly spotted with large dark brown spots; fine form and large truss, and possessing beautiful foliage. We have no hesitation in saying that this is one of the finest Rhododendrons ever raised, being perfectly hardy, which has been fully tested during the last two severe winters; for while many of the so-called hardy sorts were completely disfigured in their foliage, not a leaf of this variety was injured. 21s. to 31s. 6d.

RHODODENDRON SHAKSPEARE.—A soft rosy purple, intensely blotched with orange yellow on the top petals; a most beautiful and thoroughly hardy free late-flowering variety. 21s. to 31s. 6d.

ERICA ÆMULA.—This is a very beautiful hybrid, in the Erica Massoni section, of a fine bright crimson colour, after the style of Erica aristata, but very much higher in colour: altogether this is a very distinct variety. 21s.

ERICA EXIMIA SUPERBA.—This variety may really be said to be three times as fine as the parent, whose name it bears: it is a very compact grower and excellent in habit, with tubular blossoms of a fiery scarlet colour. This charming variety obtained the first seedling prize at the Royal Botanic Gardens, 1852. 31s. 6d.

ERICA PAXTONI.—A very distinct variety obtained by hybridising Erica Hartnelli with Erica Massoni; it blossoms in very large whorls of a soft red colour. This variety will be very useful for Autumnal Exhibition purposes, as it blossoms from July to October. 21s.

The set of the above-named Ericas, Three Guineas.

CALCEOLARIA VARIABILIS.—As a bedding plant this will make a charming variety, and in some measure supply the deficiency there has been for durable and effective plants of a light colour for the parterre. It is an excellent grower, of very compact, pretty habit, and produces in great profusion immense trusses of blossom, which open of a delicate primrose colour, and change to white. Altogether it is a most desirable acquisition, and a variety thoroughly distinct from any in cultivation. 10s. 6d. each.

NEW PRICED CATALOGUE OF PLANTS.

MESSRS. WILLIAM ROLLISSON will be happy to forward this on application. It can also be forwarded throughout the following countries, post free: America, Austria, Belgium, France, Germany, Holland, Prussia, &c. &c. COMPLETE CATALOGUES on application for six penny stamps, or the Spring Catalogues alone for three penny stamps, or gratis to our customers who may not have received them.

Seed and Horticultural Establishment, Sudbury, Suffolk.

MESSRS. E. G. HENDERSON AND SON beg to announce that in consequence of their inability to supply plants of sufficient strength so early in the season, two of the new Pelargoniums will not be sent out this year, consequently the set will now only be 3*l.* 3*s.*

Empress Eugenie.	Lady of the Lake.
Mrs Story.	Queen Victoria.
Prince Albert.	Raffaelle.
Snowdrop.	Water Nymph.

Orders for the above can only be booked and executed in rotation after the earlier orders are despatched.

THE NEW SPRING CATALOGUE

Will shortly be published and forwarded post free on application. Parties wishing for the same will have their names booked.

A COLOURED PLATE,

Composed of a group of Nine new Flowers belonging to the Stove, Greenhouse, and Garden. It will be sufficient to say that Mr. Andrews, the eminent floricultural artist, has them in course of preparation, and under his superintendence full reliance may be placed on their accuracy; any one wishing for the same will have their names booked for it, to be sent them when finished, by forwarding 12 postage stamps; and if ordered in time will be stitched-in and sent with their new Spring Catalogue. This notice also applies to any nurseryman that may wish to have the Plate.—Wellington Nursery, St. John's Wood, May 5.

NEW BEDDING PLANTS.

CHARLES TURNER has much pleasure in introducing the following New Plants:—

CALCEOLARIA "PURITY," a new and beautiful shrubby variety, pure paper white, dwarf free habit, and a most desirable bedding plant. Very highly recommended. 7*s.* 6*d.* each.

NEW VERBENAS.

*WONDERFUL (Edmonds), rich plum purple, with very large white centre. This is without exception the finest and most distinct variety yet introduced, and is especially recommended for bedding purposes, continuing fully in bloom until very late in the season. It obtained a Certificate of Merit at National Floricultural Society.

*BLUE BEARD (Edmonds), a decided blue, good shape, large truss, and an excellent bedding variety. Highly recommended.

*LADY LACON (Edmonds), bright rose, with large pale yellow centre, good shape and habit. This also is a first-rate bedding variety. Obtained a First-class Certificate at National Floricultural Society for form.

COMMANDER-IN-CHIEF (Edmonds), bright cerise, with yellow eye, free bloomer, and good habit. Very fine.

EMPRESS OF FRANCE (Edmonds), large pale rose, fine truss.

FLORENCE NIGHTINGALE (Edmonds), pink, yellow eye, good shape.

ROSE OF ENGLAND (Edmonds), bright rosy pink, with yellow eye, good form, free and distinct, fine.

TYRIAN PRINCE (Edmonds), deep blue purple, fine and distinct. Received a Certificate at Norwich.

EVA (Turner), pure white, fine truss, and free bloomer.

The above 5*s.* each, or the Set for 2*l.* The three varieties marked thus * were figured in the "Florist" for April, 1855.

NEW DAHLIAS.

Pre-Eminent (Fellowes)	10*s.* 6*d.*	Glenlyon (Fellowes) ...	7*s.* 6*d.*
Lord Bath (Wheeler) ...	10 6	Diadem (Fellowes) ...	7 6
Espartero (Turner) ...	10 6	Constancy (Hopkins) ...	7 6
Beauty of Bath (Bush)	10 6	The Nigger (Fellowes)	10 6
Ringleader (G. Holmes)	10 6	Baron Alderson (Perry) a fancy variety ...	10 6
Attack (Fellowes) ...	10 6		
Agincourt (Fellowes) ...	10 6		

For Descriptions of these varieties see Catalogue, which can be had on application.—Royal Nursery, Slough.

NEW STRAWBERRY—CAROLINA SUPERBA.

JAMES KITLEY begs to inform his friends and the public that he has succeeded in raising from Seed a New Strawberry, the qualities of which have long been a desideratum. It possesses the excellent flavour of the old Carolina, the fruit as large as the British Queen, with all the combined good qualities of productiveness, hardiness of plant, dwarf habit, &c., which tend to make it a general favourite. It was exhibited at the Chiswick Horticultural Exhibition, and obtained a First-class Certificate.—See *Gardeners' Chronicle*, July 15, 1854.

Dr. Lindley's Opinion.

"J. K., the Strawberry which you have named Carolina Superba partakes of the flavour of the old Carolina, but the fruit was bruised by carriage, so that the paper which accompanied the Strawberries was saturated with juice, and this juice dried on the paper like syrup — sweet, adhesive, glossy, and brownish coloured. Strawberry juice does not usually possess these properties."—See *Gardeners' Chronicle*, July 1, 1854.

The undermentioned gentlemen having had opportunities of seeing it growing, and also tasting the fruit, have kindly permitted their Testimonals to be placed before the public:—

"Your Carolina Superba Strawberry, which I saw last summer in bearing, appeared a very hardy and productive kind, with the flavour of the old Carolina, and will prove an acquisition to this class of fruit.

"JOHN SPENCER, Marquis of Lansdowne's, Bowood."

"I feel much pleasure in giving my opinion of your Seedling Strawberry, Carolina Superba. Having had frequent opportunities of seeing it growing and tasting the fruit, I consider it hardy, of good habit, short foliage and fruit-stem. In flavour and crop, I know none that will surpass it; and feel assured it will do you credit, and give satisfaction to all who may purchase it.

"JAMES POND, Devonshire Cottage, Bath."

"The Seedling Strawberry, named Carolina Superba, that I saw fruit in your nursery last season, appeared to me to be a first-rate variety of dwarf foliage, a profuse bearer, and flavour excellent. I have no doubt it will give the greatest satisfaction to all who may possess it.

"D. BUTLER, Widcombe Nursery, Bath."

Strong well-rooted PLANTS are now ready, at 3*l.* per 100, 10*s.* per dozen, or 12*s.* free by Post.

Lyncombe Vale Nursery, Bath.

TWO VERY USEFUL NEW DWARF NASTURTIUMS.

JOHN CATTELL has much pleasure in bringing into notice these two very showy hardy ANNUALS, viz.:—

NASTURTIUM DWARF CRIMSON.—The colour of the common dark crimson.

Ditto DWARF SCARLET.—The colour very rich orange scarlet, with a fiery shade on the upper part of the throat.

They are both of the dwarf compact habit of minimus, and admirably adapted for forming large buds, particularly in any poor soils; the flowers are the size of the common Nasturtium, and thrown well above the foliage, and are a mass of bloom throughout the summer and autumn. Packets, containing 12 seeds, 1*s.* each, post free.

J. C. has also the following choice Seeds for present sowing, at the prices annexed per packet, post free:—

	s.d.		*s.d.*
Alstræmeria acutifolia ...	1 0	Lychnis fulgens	0 6
Anemone, single Poppy, fine mixed	0 6	Mandevilla suaveolens ...	0 6

N.B. The new Hybrid Perpetual Rose Emperor Napoleon will not be sent out before June; by that time I shall have proved it. If not more than semi-double, I much question if it is worth 7*s.* 6*d.* I, however, received a very high character of it, which induces me to offer it to the public, *but not to let it out before proving its worth.*

Carriage paid to any Station on the Eastern Counties Railway.

St. John's Street Nursery, Colchester.

MESSRS. J. AND H. BROWN offer the following CHOICE PLANTS, &c., which they will forward to any part:—

	s.	*d.*
Andromeda floribunda, per dozen ... ... 12*s.* to	18	0
25 Azaleas, new hardy Belgian varieties, one of a sort, by name on their own roots	20	0
25 Azaleas, American varieties, do. do.	16	0
Hardy Heaths, Ledums, and Kalmias, per dozen ...	6	0
25 Hardy American Plants, one of a sort, by name ...	10	6
12 Rhododendrons, including scarlet, white and rose ...	12	0
Fine hardy Scarlet Rhododendrons, 1 to 2 feet, per doz.	12	0
New Yellow Rhododendrons, in pots, each 3*s.* 6*d.* to	5	6
6 Fine hardy Magnolias, one of a sort, in pots	10	0
Wistaria sinensis, strong plants, in pots, each	3	6
12 Hardy Climbers, of sorts, in pots	12	0
Fine climbing Roses, of sorts, per dozen, in pots ...	8	0
Bourbon Roses, budded, 1 ft., fine for beds or edgings, do.	10	0
Fitz-Roya, Saxe-Gothæa, Cephalotaxus, Libocedrus, each	5	0
Wellingtonia gigantea, and other choice and cheap hardy Coniferæ (see list).		
Cedar of Lebanon, 2 to 3 ft., well grown, per doz., 12*s.* to	18	0
Greenhouse Azaleas, choice varieties, per dozen 12*s.* to	18	0
6 New Achimenes, and 6 Gloxinias	10	0
50 choice Greenhouse plants, one of a sort	45	0
Orchidea Plants, beautiful species, by name, per dozen	40	0
24 choice Ericas, one of a sort	16	0
24 choice Fuchsias, fine proved varieties	12	0
6 Tree Carnations, choice sorts	6	0
Verbenas and Petunias, best sorts, per dozen	4	0
Calceolarias and Cineraria, in flower, per dozen, 9*s.* to	12	0
Fancy Geraniums, best sorts ... ... per doz.	15	0
First Class Carnations and Picotees ... ... „	10	0
First-rate sorts of choice Pinks ... ... „	6	0
25 choice Pansies, one of a sort...	10	0
25 choice hardy Herbaceous Plants, named	10	6
Pentstemons, Lobelias, new Phloxes and Potentillas, per dozen	6	0
Dahlias, the best fancy and show sorts, per dozen ...	12	0

Choice Flower Seeds, 20 papers, 5*s.*; 45 ditto, 10*s.* Free by post.

Conservatories, Greenhouses, and Gardens furnished on moderate terms.

Albion Nursery, Stoke Newington, London.—May 5.

TWO MAGNIFICENT NEW CALCEOLARIAS ADAPTED FOR BEDDING OR POT CULTURE.

"EMPEROR NAPOLEON AND EMPRESS EUGENIE."

YOUELL AND CO. have much pleasure in introducing the above beautiful varieties of this favourite flower, which they do with the greatest confidence of giving the most entire satisfaction. The following will be found a faithful description:—

EMPEROR NAPOLEON.—This is of a peculiar dwarf and compact habit, producing, on stout flower stems, dense heads of large orange-scarlet flowers, the outline of each being distinctly banded with a brilliant gold colour.

EMPRESS EUGENIE.—This, as the former, is of a dwarf but more robust habit, carrying, on extremely stout stems, an enormous head of rich, golden-coloured flowers, which, in point of size, are unequalled.

The foregoing possess the desirable properties of resisting the sun and rain without discolouring the bloom. The above are now ready for sending out at 7*s.* 6*d.* each, with the usual discount to the trade.—YOUELL & Co., Royal Nursery, Great Yarmouth.

SUPERB NEW HYBRID HEATHS.

LUCOMBE, PINCE, AND CO. are now prepared to send out their beautiful well known NEW HYBRID HEATHS; they were exhibited at the Horticultural Society's Meeting in Regent Street, and obtained the large Silver Medal. The following is the description given by the Editor of the *Gardeners' Chronicle*, May 28, 1853:—

"*Messrs.* LUCOMBE, PINCE, & Co. *received a Large Silver Medal for a Collection of New Hybrid Cape Heaths, consisting of*

LINDLEYANA, EXONIENSIS,
INSIGNIS, PULCHERRIMA, EXQUISITA,
METULÆFLORA-SUPERBA,

all fine kinds, possessing large bold flowers and bright clear colours; they were stated to have been raised from Massoni, Ampullacea, Sprengelli, Hartnelli, and Aristata, all, it will be seen, good parents."

L., P., & Co. can assure all cultivators of this beautiful tribe of plants that these fine varieties cannot fail to give satisfaction, as they possess excellent habits, and have large rich coloured flowers of much substance, which are produced in great profusion,—properties that fully justify L., P., & Co. in very strongly recommending them to the public. Price, 3*l.* the set of Six.

Exeter Nursery, Exeter.—Established 1720.

FLOWER SEEDS.

PETER LAWSON AND SON, SEEDSMEN and NURSERYMEN to the QUEEN, Edinburgh, and at 27, St. George Street, Westminster, beg leave to invite attention to their very choice selection of Flower Seeds.

27, St. George Street, Westminster.

The Gardeners' Chronicle.

SATURDAY, MAY 5, 1855.

MEETINGS FOR THE ENSUING WEEK.

TUESDAY, May 8—Horticultural ..... 3 P.M.
WEDNESDAY, — 9—Royal Botanic..... 3 P.M.

LAST Tuesday was the fiftieth anniversary of the HORTICULTURAL SOCIETY OF LONDON, and the Council took advantage of the occasion to lay before the meeting a sketch of the rise and progress of this great Corporation up to the present time. The report itself is much too long for our space, and we therefore confine ourselves to condensing portions of it, recommending every one to read the complete report if he can.

The Society was established in the year 1804, since which time great changes have taken place, the face of gardens is entirely altered, and the art of cultivation has been brought to a state of perfection which could not have been anticipated 50 years ago. Probably few persons have any distinct recollection of the real state of gardening in the beginning of the present century. It is however obvious from the writings of those who flourished at that time, that no English garden bore much resemblance to the first-class establishments of the present day. Vegetable physiology had only just begun to be applied to practice; what was good in cultivation did not extend beyond the fruit and kitchen garden, which was scantily supplied with varieties scarcely now remembered, except in the case of a few fruits and esculents little susceptible of change. Flower gardens, shrubberies, and plantations contained little that had not been in them for a century and more. MARSHALL, whose book on gardening had passed through five editions by the year 1813, has even at the last date few trees among his lists beyond such as are natives of Europe, or as form the commonest vegetation of the United States; and his annual and perennial flowers have long since been confined to Botanic Gardens, with the exception of Cockscombs, Balsams, some Convolvuli, Hollyhocks, Stocks, Mignonette, Chinese Pinks, and a small number of other common species.

Of the then state of gardening we may form some idea from an address in April 1805 by the late THOMAS ANDREW KNIGHT, beyond all comparison the most experienced practical gardener, as well as scientific experimentalist, of his day. Speaking of the need there was of some stimulus to horticulture, he made the following observations:—

"Societies for the improvement of domestic animals, and of agriculture in all its branches, have been established with success in almost every district of the British Empire. Horticulture alone appears to have been neglected, and left to the common gardener, who generally pursues the dull routine of his predecessor; and, if he deviates from it, rarely possesses a sufficient share of science and information to enable him to deviate with success. In training wall trees there is much in the modern practice which appears defective and irrational: no attention whatever is paid to the form which the species or variety naturally assumes, and be its

ADDRESS: SUTTON & SONS, SEED-GROWERS, READING.

growth upright or pendent, it is constrained to take precisely the same form on the wall. The construction of forcing houses appears also to be generally very defective, and two are rarely constructed alike, though intended for the same purposes; probably not a single building of this kind has yet been erected, in which the greatest possible quantity of space has been obtained, and of light and heat admitted, proportionate to the capital expended. It may even be questioned whether a single hotbed has ever been made in the most advantageous form; and the proper application of glass, where artificial heat is not employed, is certainly very ill understood."

It was in March, 1804, in a room in the house of Mr. Hatchard, the eminent bookseller in Piccadilly, that the Society was first organised. On that occasion there were present Mr. Charles Greville, Sir Joseph Banks, Mr. Rich, Anthony Salisbury, a distinguished botanist of the day, Messrs. W. T. Aiton and W. Forsyth, two of them royal gardeners, and Mr. James Dickson, an experienced practical gardener. When organised, which occurred in a week's time, the list of members included the names of all who in those days were most distinguished for their knowledge of horticulture. The mere institution of the Society, therefore, conveyed a distinct declaration, by those best qualified to form an opinion, that the state of gardening stood in very great need of improvement.

In 1810, the first number of the "Horticultural Transactions" made its appearance, a publication which ultimately extended to 10 quarto volumes, replete with horticultural information both theoretical and practical of the highest value, and from which writers on gardening subjects have not failed to extract a large part of their knowledge. The cost of publishing these deservedly celebrated volumes had in 1830 amounted to 25,250*l.*; and they were not finally discontinued till the year 1848.

In the year 1816 (March 5) the first bye-laws were passed, and by May, 1818, the prosperity of the Society had so much increased as to lead to the hire of an Experimental Garden at Kensington. The elections rapidly increased, having risen from 73 in 1818 to 328 in 1821, the largest number ever added to the Society in one year.

About this time the effects of that system of obtaining valuable foreign plants from extra-European countries, by which the Society has conferred such inestimable benefits upon these kingdoms, began to be felt. In the accounts of 1819-20 appears for the first time a charge of 108*l.* 18*s.* 9*d.* under the head of foreign importations. Plants had begun to arrive from China; not the least important of which was the magnificent Glycine (or Wistaria) sinensis, of which the first living plant, now an aged tree in the Society's Garden, arrived in 1818.

By the year 1823 gardeners had been despatched to the coast of Africa, the West Indies, South America, and China, and extensive collections of valuable exotics had been procured from distant colonies. In 1823, 1200 varieties of Roses existed in the Garden; and this assemblage, as well as the importations from China, may be assumed to have led to that elimination of bad sorts, and general improvement of the Rose, which has rendered the modern Rose garden a scene of perpetual enjoyment, instead of a summer display which only lasted for a month or six weeks.

In 1822 the Society obtained a lease of the present Garden at Chiswick; the admission fee was then raised to 6*l.* 6*s.*, and the annual subscription from 3*l.* 3*s.* to 4*l.* 4*s.* At the same time, with a view to defray the cost of the new Garden, a voluntary subscription was opened, which ultimately reached the sum of 7275*l.* 2*s.*

In 1827 it was resolved to discontinue the anniversary dinners previously held in London, and to substitute for them fêtes or public breakfasts. These assemblages were unprofitable, produced dissatisfaction, and were discontinued after 1831. The first was held June 23, 1827. It was attended by 2843 persons; gave rise to a lawsuit between the Council and the purveyor; and produced a profit of 504*l.*, of which however 213*l.* were afterwards consumed in legal proceedings. The second occurred on June 21, 1828; it was attended by 4193 persons, produced a gross sum of 4760*l.*, and a loss estimated at 139*l.* The third took place on June 27, 1829; tickets were sold to the amount of 5185*l.*; the expenses were 5162*l.*, and the balance in favour of the Society 22*l.* 16*s.* 6*d.* The fourth and last was on the 23d June, 1831; on which occasion the balance in favour of the Society was ascertained to be 115*l.* 12*s.*

These experiments, having proved unsuccessful were finally abandoned, and replaced by the Garden Exhibitions, which have formed so great a feature in the recent history of the Society.

By the year 1826 the heavy charges incurred in the formation of the Garden had begun to affect seriously the pecuniary resources of the Corporation, and the floating debt had acquired very formidable dimensions. In addition to this source of embarrassment, differences arose between the Society and the then Secretary, which led to the appointment in February, 1830, of a Committee of Inquiry, which was authorised to investigate the management of the Society. This Committee reported that the debts of the Society amounted to 19,750*l.*, of which 14,200*l.* were on bond (they eventually proved to amount to about 500*l.* more, or 20,243*l.*), and they did not estimate the property of the Society higher than 16,500*l.*, exclusive of the annual subscriptions about to fall due. They found that the cost of the formation and annual expense of the Garden for the eight years from 1822 to 1830 had exceeded the amount of all separate subscriptions and sources of garden revenue, of whatever kind, by the large sum of nearly 29,000*l.* They however added that many objects of the Society had been substantially fulfilled; that the foreign missions for collecting plants had been eminently beneficial, &c., &c. The Committee declared that these results could not have been attained without continued exertion and superintendence, and that whatever errors had been committed, had arisen from mistaken judgment, rather than from want of zeal in promoting the objects of the Society.

Nor, add the Council, could the Committee have said less when it appeared in evidence that a large part of the debt had been incurred upon the faith of a promise made by Government in May, 1825, but not fulfilled, that 5000*l.* should be given to the Corporation in aid of their funds; that 16,464*l.* had been sunk in permanent works in the Garden; that 5737*l.* had been expended upon procuring plants, &c., from abroad for distribution among the Fellows; that more than 880*l.* worth of medals had been given as encouragement to horticultural skill, and that the costly "Transactions" had been distributed gratuitously to the Fellows, during a period of 20 years, without the funds of the Corporation having furnished more than about 4000*l.* for the purpose.

Between 1823 and 1830, the Council observe, the progress of the Society in works of permanent utility had been continual and rapid. The confusion that formerly existed among fruits and esculents had been reduced to order. That system of heating glass structures by hot water, instead of by flues or expensive applications of steam, to which modern gardeners owe so much of their success, although it did not originate in the Garden, was first systematically applied there in the face of great opposition from those who objected to the introduction of a method to which they were unaccustomed; and the rapidity with which it gained public favour must certainly be ascribed in a great degree to the proofs which the Garden furnished of its perfect suitability to cultivation. The importance of regulating the moisture of the atmosphere of glass-houses—never attended to systematically by the older gardeners, but which has become one of the corner-stones of successful horticulture—was first demonstrated in the Garden, after having been pointed out by Daniell in the Society's "Transactions." With instruments of the best construction, procured and placed under the advice of the late Professor Daniell and the present Colonel Sabine, a series of daily observations of the barometer, thermometer, hygrometer, rain gauge, &c., was commenced on the first of May, 1825, and has been continued to the present time; and the Council believe that there does not exist in this country so long, exact, unbroken, and trustworthy a record of the climate of London as the "Meteorological Journal" of the Society has now become. Nor must it be forgotten that in 1830 the country was in full possession of those numerous and now universally cultivated hardy plants, which resulted from the expedition of Douglas to the then almost unexplored regions governed by the Hudson's Bay Company. The Brodiæas, Collomias, Eutocas, Gilias, Gaillardias, Coreopsides, Clarkias, Godetias, Collinsias, Lupines, Escholtzias, the musky Mimulus, numerous Pentstemons, and many another universal favourite in the flower garden owe their origin to the Horticultural Society of that period, as also do the Holly-leaved Berberry, Spiræa ariæfolia, Vaccinium ovatum, Garrya elliptica, Rubus spectabilis, Gaultheria Shallon, the Ribes sanguineum, aureum, and speciosum, the Douglas Fir, and many more of our noblest and hardiest Coniferous trees. To this may be added the names of the Fuchsias, Salpiglotts, Schizanths, Œnotheras, Petunias, Calceolarias, Verbenas, brought from Chili and elsewhere, which laid the foundation of races unrivalled for the brilliant effects produced by their descendants in modern flower gardens.

The Council next allude to the measures taken after the report of the Committee of Inquiry had been received, and give the history of their Garden Exhibitions, which have rendered the modern history of the Society memorable. The experiment was made in 1833 and proved successful; the exhibitions were popular; the number of elections began to increase; a profit of 340*l.* was carried to the credit of the Society, and a reduction of the dead weight to the amount of 951*l.* was immediately effected. Since that time the Garden Exhibitions have yielded about 43,000*l.* of clear profit.

The Council remark that with such means at command the incumbrances of the Society could have been readily liquidated, had there been no other purpose to gain than that of paying off liabilities. But it was obvious that however desirable extrication from debt might be, the managers of the Society were appointed for other purposes. A part of the debt dated as far back as 1824; the whole of it was incurred before 1830; and it seemed unjust to the Fellows elected since that time to apply the funds supplied by them to no other purpose than the discharge of debts, to contracting which they had been no parties. Nor could the various Councils avoid feeling that to discontinue the improvement and encouragement of horticulture would be virtually to abandon the purposes for which the Society was incorporated. They therefore endeavour to combine the liquidation of liabilities with a vigorous prosecution of the objects declared in their charter. Since 1830 nearly 11,000*l.* has been expended in works of permanent utility; and more than 7000*l.* in the introduction of rare plants and seeds; notwithstanding which the debts have been gradually reduced to 8800*l.* In the course of this time the high character of the Society has also been sustained, among other measures by a most liberal distribution of medals and pecuniary rewards for meritorious productions, under which head alone 19,224*l.* has been expended since 1830; by an enormous distribution of seeds, plants &c., amounting to almost a million and a half; and by an impulse given to horticulture to which there is no parallel.

After alluding to some other points the Council refer to the enormous debt *bequeathed* to the Society in 1830. Up to 1852 a pretty steady reduction of this incumbrance continued to take place; but in 1853 and 1854 it was slightly increased, and again in 1855 to the amount of 1250*l.* This has chiefly arisen from the thin attendance at the Garden Meeting in May, when there was an important launch at Woolwich in presence of her Majesty, and from that in June having fallen into unfortunate proximity with the day on which the Queen opened the Crystal Palace.

The Council report that in consequence of this unforeseen event, immediate means were taken to curtail expenditure; his Grace the Duke of Devonshire reduced the Garden rent from 300*l.* to 200*l.* a year, and a valuation of the property of the Corporation was ordered to be made. The result shows a balance of property *over* liabilities, *in favour* of the Society, of more than 15,000*l.*

The Council observe in conclusion that the career of the Society has been, upon the whole, one of much prosperity, and they cannot but look back with pleasure to the important public services which that prosperity has enabled the Corporation to perform. They therefore invite the Fellows each to exercise his influence in recruiting the ranks of the Corporation. "When it is considered that the admission fee is now only two guineas, that the annual subscriptions are retrospective *and not payable in advance*, that ladies are admissible as Fellows, that the publications of the Society are distributed gratuitously, that Fellows have free personal admission to the Garden, and to the Meetings, that at present there is no limit to their power of issuing orders for free admission to the latter, that for Garden Meetings each Fellow has the power of obtaining a considerable number of privileged tickets at a lower rate than the general public, that the distribution of seeds and plants will certainly increase in proportion to the means at our disposal, and is already far more extensive than is generally supposed, and finally, that no personal liability whatever is incurred, the advantages which the Society offers to those who join its ranks are so great that there seems to be every inducement to enter an association from whose continued efforts for half a century the present flourishing state of garden cultivation is unquestionably derived."

We quote the last paragraph literally, and sincerely hope it may be responded to in a manner worthy of the members of so important an institution.

We have received from the author a new pamphlet* on the Potato Disease, in which an attempt is made to show that that calamity arose from the presence of nitrogenous or ammoniacal matter in

* "Facts and Observations relative to the Potato Disease, its probable Cause and Cure." By John Malam, Esq. Longman. A 12mo. pamphlet of 28 pages.

the soil: and that the remedy is to withhold all substances capable of yielding ammonia. At least such appears to us to be the substance of the little treatise before us.

So far as producing evidence obtained by himself as to the advantages of refraining from the employment of rank manure in cultivating the Potato, we are glad to see Mr. Malam's remarks; but we are surprised to find them published in the year 1855 as something new, for the same result was obtained by ourselves several years since, after an examination of the numerous returns from all parts of the United Kingdom, procured with great labour and trouble in the year 1849, and then published in our columns. There has never, indeed, been the least difference of opinion in the minds of well-informed persons that all manures containing ammonia are prejudicial to the crop. This has been stated over and over again in our columns, and no reasonable doubt exists of its perfect truth.

But although ammoniacal matter most unquestionably increases the tendency of the Potato to disease, we are by no means called upon to believe that it caused the disease. It is, indeed, not a little singular that Mr. Malam should not have felt that, to establish his case, it is necessary to show that ammonia in excess was presented to the Potato crop for the first time in the year 1845. Was that so? Surely not. If heavy rains fell then, so had they hundreds of times before without destroying this plant; and it will surely not be pretended that thunderstorms broke over Potato fields for the first time in 1845. It may be very true, and we believe it was so, that the Potato crop in some cases ran into a state of putrefaction immediately after thunderstorms, or when the air was highly charged with electricity; but these were customary events, and they produced no disaster till 1845. There can therefore, be no doubt that something had occurred to the Potato in 1845 which had never occurred before, and which made it prone to become diseased from the operation of causes previously inoperative. This is the answer that we give to all speculators upon this singular visitation, from Prof. Liebig at the top of the scale to Mr. Alfred Smee at the bottom.

On other points we also find matter worth a notice, every word of which has, however, been years ago anticipated in our columns. The most striking is what relates to tar as a preventive of disease. On the 6th of March, 1847, we gave the history of a fisherman who had accidentally smeared his Potatoes with tar, and of the produce which had proved sound. This now appears in the following form of illustration of the value of non-nitrogenised matter as manure for Potatoes. Gas-tar is a hydrocarbon which, according to our author, has no nitrogen in its composition, and which, he thinks, is a singularly good manure for Potatoes.

"To test the disinfecting properties of coal tar, I had three cesspools emptied, the sewerage of them being diluted with 1 gallon of tar (price 3*d.*) to about 100 or 120 gallons of the water. One of the cesspools contained about 1000 gallons of sewerage from the water-closet, and the effect was to render it so completely inodorous, that neither I, nor those employed, could perceive any smell of the water when close to it. The naphtha in the tar, in combining and forming a new compound with the sulphuretted and phosphuretted hydrogen gases, &c., leaves a black sediment at the bottom of the cesspools like coal-dust. Mr. Reed, of Montrose, in his letter in 'The Journal of Gas Lighting' states, 'Although I am unable directly to corroborate its efficacy in preventing the Potato disease, I can with certainty affirm its value generally as a manure. The farmer who made use of the ammoniacal water we sent him frequently obtained quantities of our coal tar, which he valued very highly, but his mode differed from that mentioned by Mr. Malam. While storing up the manure from his stable and cattle sheds in the dung-court, his method was to deposit a layer of about 1 foot deep, and, when levelled, he sprinkled over it a good coating of tar. This was covered over by another layer, and tar similarly applied, and in this manner he made up the heap. The decomposition of the mass did not appear to be retarded in any way, but a singular change in the nature of the tar itself takes place. Its oily character shortly disappears by its absorption in the manure, and a carbonaceous powder remains in its place. Manure thus prepared has invariably been found to produce much richer cereal, and greener crops than ordinary, and abundantly repays the cost.' Mr. Reed here fully points out the value of gas tar as a manure. Considering the value of sewerage water and tar, I have had the mixture applied to all my Peach, Apple, Gooseberry, and Currant trees, and to a small plot of Grass land. I have suggested that different Boards of Health should adopt the plan I point out, for the conversion of the sewerage of towns into a profitable manure, by its dilution with coal tar. The process, so far from being prejudicial to public health, would be beneficial to it. The disinfectant properties of the tar not only neutralise the noxious gases emanating from the sewerage, but give out those volatile properties advantageous to health in a vitiated atmosphere."

Whatever opinion may be formed of the relation of these statements to the Potato, it is at least certain that they possess public interest for reasons of another kind.

New Plants.

123. Escholtzia tenuifolia. *Bentham in Trans. Hort. Soc., Ser.* 2, I. 408. *B.M. t.* 4812.

This is one of the very pretty annuals imported by Messrs. Veitch & Co. Like Esch. californica it is perfectly hardy. Whatever botanical difficulties may stand in the way of a rigorous definition of the plant, no reasonable doubt can, we think, be entertained that it is a perfectly distinct species, without the strong straggling habit

of the common kind, for which is substituted a compact tufted manner of growth. Its leaves too are much finer and somewhat downy, its flowers much smaller and prettier, paler on the under than upper side of the petals, and the calyx-cup destitute of any conspicuous shining horizontal rim.

It is one of the neatest annuals among the novelties of the season.

VEGETABLE PATHOLOGY.—No. LXX.

306. 3. Chlorosis of Cucumbers. *Cucumber Disease.*—The first notice that I can find of this disease is in 1844, when complaints were made that Cucumbers were apt to exude a gummy substance from their surface, a circumstance supposed then to be attributable either to excess of moisture or want of bottom-heat, while the superficial temperature was high. In 1846 these complaints were faintly repeated, but in the following year the evil became so widely diffused as to excite a good deal of attention amongst cultivators. Specimens were at that time submitted to me for inspection with an intimation that there could neither be excessive moisture nor defect of bottom-heat from the construction of the frames; and it is now well known that the very best cultivators are scarcely less subject to the evil than those *practical* men with whom everything depends either on chance or inveterate routine. The whole history of the disease shows that it is strictly constitutional, and though the subsequent indications if examined by themselves might lead to a different conclusion, an attentive consideration of its early stages and development point out that it is essentially a case of chlorosis.

307. The Cucumber disease, like most other constitutional maladies, makes its appearance at very different stages of growth. Sometimes the plants are what gardeners call "miffy" from the very first, inclined, that is, to damp off; sometimes they progress rapidly till the blossoms appear, when both the leaves and shoots are affected; but more frequently the malady appears when the young Gherkins are just formed, and attains its height by the time the fruit is fully developed. In all cases, we believe the first symptom of the disease is an unnatural paleness confined to certain spots, in consequence of the chlorophyll being only imperfectly developed or altogether wanting. Meanwhile the neighbouring cells may be in exuberant health, and may in some cases increase so rapidly as to cause distortion, a circumstance which is far from uncommon in the fruit, where the lower part often increases while the tip makes no progress, or even withers up entirely. According to circumstances these chlorotic spots exhibit different phenomena. The cells of which they are composed are equally unfit to resist heat or moisture; in the former case they dry up on exposure, and the foliage exhibits a disagreeable withered aspect, even though the plant itself should not entirely fail. Sometimes, however, especially in the more juicy parts, as in the shoots and fruit, the gummy fluid not being disposed of in the formation of chlorophyll bursts through the walls incapable of exerting much resistance, and as air and moisture are thus admitted to the tissues and the spores of moulds enter with them, decomposition of greater or less rapidity, according to varying circumstances, takes place. These secondary phenomena are, in fact, no part of the disease itself, but only a consequence of it. Further facilities for decomposition are afforded by the condition of the tissues. A vertical section through the diseased fruit in an advanced stage of the malady shows that the intercellular passages are extremely dilated, and in aggravated cases the component cells eventually disunited, circumstances which are highly favourable to decomposition, though even in these cases I have seen an attempt at the formation of new independent cells, containing chlorophyll in the intercellular cavities. In some instances, after the disease has advanced to a certain stage, a curative process commences, arising probably from some favourable condition of external circumstances, by which the diseased matter is isolated, and the fruit, though full of unsightly pits, goes on to maturity without decomposition. In the earlier stages something may certainly be done by attention, maintenance of that degree of light, warmth, and dryness which the particular case may require, and in the Melon disease which has lately been so troublesome, and which seems perfectly identical, I have myself seen cases where a crop has been secured simply by careful vigilance, with nothing beyond a common garden frame and stable manure, while in a neighbour's garden, with every available horticultural means, there has been a total failure.

308. Where the disease advances to that condition in which actual decomposition takes place, there is almost always a development of fungi, such as Cladosporium herbarum and Botrytis capitata, but though they may possibly take their share in producing more rapid decay, they have no primary part in the matter.

309. As the disease is strictly constitutional, the only way to combat it effectually is by securing if possible healthy seed. I have very lately suggested in this journal a method which might easily be pursued, viz. to take the oldest seed which can be procured, and to select from such plants as germinate the very healthiest, rejecting all which show the slightest indication of disease. Meanwhile the fruit intended for seed should be impregnated with pollen from the healthiest plant that can be found. A little attention in this respect would soon produce seed upon which dependance could be placed, and if, as I believe to be the case, the malady is universal,* no other method can give security. The offspring of two animals of a strumous constitution is sure to be weakly, and twice as sickly as its parents, and the same principles hold good amongst vegetables.

Our figure, reproduced from our article 1847, p. 356, represents at 1, 2, 3, the condition of the tissues in a diseased fruit. In Number 3, the cells of the cuticular strata are undisturbed, while those beneath are entirely separated, stained with ulmates and humates, while in one intercellular space a new cell is formed containing chlorophyll. Figures 4, 5, 6, represent Botrytis capitata,

* Plants raised from foreign seed are quite as subject to disease as those from the best English gardens. A white and a green variety from Brussels with extremely small fruit, viz., Concombre de Bonneuil and Concombre vert à petits cornichons, were so diseased last year that I could scarcely secure a single well-formed fruit of each to ascertain its characters.

Fries; 7, 8, Cladosporium herbarum. Fig. 9 represents dead cells attached to the cuticle of the leaves of Portugal Laurel, to which I shall have some future occasion to allude. *M. J. B.*

SARRACENIA DRUMMONDI.

Visitors to Chatsworth, in the summer and autumn of 1849, were scarcely more surprised at the glorious aspect of the Victoria Lily, than at the exquisite beauty of this plant, many large specimens of which decorated a neighbouring stove among rare Orchids of the richest hues and the most interesting forms.

It was, we believe, originally introduced by the late Mr. Drummond, who met with it in Florida, near the town of Appalachicola. It has since been found abundantly, by Dr. Chapman, on the western borders of the river of the same name, below Ocheesee. It, therefore, inhabits the swamps of a region which, during summer, experiences a tropical heat, as in some measure indicated by the presence of Orchidaceous Epiphytes, such as Epidendrum Magnoliæ and tampense.

The pitchers of this plant are from 18 inches to 2½ feet long, perfectly erect and straight, with very much the form of a postman's horn. Their colour is of the most vivid green, except at the upper expanded end, where they are brilliantly variegated with white, red, and green. The rim of the orifice of the pitchers is slightly folded back, from the front towards the back, where it expands into a broad roundish arched cover, much undulated and crisped. In the inside this cover is clothed with long hairs, which partially disappear towards the entrance of the pitcher, at which point there is a considerable exudation of sweet viscid matter, apparently secreted by the hairs which exist there. The flower is of a dingy purple colour, roundish, about 2½ inches in diameter, with five blunt acuminate sepals, five obovate inflexed petals, and a pale green diluted five-angled membranous stigma, which is nearly as long as the flower itself; each angle is divided into two short lobes, beneath which, in a fold, lies the real stigmatic surface. These flowers have little beauty, and are by no means the object of the gardener's care.

The so-called pitchers are in reality the leaves of this plant, in a very singular condition; the pitcher itself being the leafstalk, and the cover its blade. By what mode of development this kind of structure is produced has never yet been conclusively shown. It has been thought that the pitcher is formed by the folding together, in its earliest infancy, of the two sides of a flat leafstalk, the line of which union is indicated by a firm elevated rib, which proceeds from the base to the opening of the pitcher, as if to stiffen and sustain it; but this is not certain, and it is more probable that the pitcher is the result of a hollowing process, coeval with the first growth of the pitcher itself, and analogous to that which produces the hip of the Rose, or the cup at the bottom of the calyx of Eschscholtzia, or the cups that appear accidentally upon Cabbage leaves.

If the exact nature of the pitcher is thus undecided, we are still further from a knowledge for the use for which so singular an apparatus is destined. To the common idea, that nature intended it to hold water, arise these objections: that water is not found in the pitcher except after rains or heavy dews, and that plants which grow naturally in bogs can hardly require any unusual apparatus for supplying them with water. Others think that the pitcher is a contrivance for detaining insects in captivity till they perish and decay, the putrefaction of these creatures conducing to the nutrition of the plant. But there is no apparent reason why the Side-saddle flower should require this sort of special nutriment more than its neighbours in the same bogs, which have no pitchers. This, however, is certain, that if the pitchers were intended for fly-traps, they could hardly have been more ingeniously contrived. It is the honey of the mouth of the pitcher that tempts the insects to their destruction; and, accordingly, they are found in abundance at the bottom. In the plant now before us we count, in the month of February, about a dozen, two of which are wasps; and Mr. Croom says that he found in one of his a large butterfly (*Papilio Turnus*). Reversed hairs keep them there without hope of escape. As the sides of the pitchers consist of very lax cellular tissue, containing large cavities in every direction, and as starch grains in abundance escape from the sides when wounded, it is a question whether this starch, converted into sugar by the vital force of the pitcher, may not serve to sweeten the water in which the imprisoned insects meet a miserable end?

The manner in which the North American Side-saddle flowers are grown at Chatsworth is explained in the following memorandum, which is applicable to the more common species as well as to that which is the immediate object of the present article:—

"The stove is decidedly the most suitable place for these species making and maturing their growth, at which time they require much warmth and moisture. A temperature of from 80° to 100°, with plenty of water at the roots, and syringing three times a day, from March till September, we have found to suit them the best. During their season of rest, a greenhouse would probably answer the ends of cultivation better than the stove; at all events, the plants should be kept in a dry cool atmosphere, from 40° to 60°, not higher. The best time for potting is January, and the best material for that purpose is silver sand and sphagnum, well mixed with a portion of peat and potsherds, broken quite small. It is important to have plenty of drainage, and no fear need be entertained of excess in this particular. It has been customary at Chatsworth to place the pots in saucers which have been kept full of water during the whole of the summer season. We do not, however, attach any importance to this practice. The plants will thrive equally well without saucers. Pitchers are usually formed in October, and continue perfect for three months. The number of pitchers on an individual plant of S. Drummondi varies from 14 to 23. We have measured individual pitchers of this species, and find the maximum length 2 feet 3 inches, and the maximum girth at the *top*, 6 inches. Flowers usually open in March and April. By removing the flower-buds as they appear, the succeeding pitchers become much finer."—*Paxton's Flower Garden.*

CLIMATE OF FOREIGN COUNTRIES.

No. VIII.

Nice, 23*d April*, 1855.—The weather has been splendid here of late, the sky being nearly cloudless since the 4th inst. The temperature has considerably increased, as will be seen from the statement annexed. Various flowers have in consequence come rapidly into blossom, and most of the trees are in full leaf—Whitethorn came into flower on the 9th; Lilacs have been very fine, but are now going off; Banksian Roses (yellow and white) on pillars and on walls are now in perfection, together with the Chinese and several other kinds, which are extensively grown for the purpose of distillation for perfumery; Verbenas are also in flower in the borders, having lived through the winter; the Quince is common in the hedges, and looks quite showy; Strawberries are generally out, and on the 19th inst. I saw several ripe on an open southern bank; the large yellow Antirrhinum, pink Cistus, red Valerian, yellow Coronilla, and Cytisus, growing wild in profusion on the sides of the hills, look very gay; the white Spiræa is in fine bloom in the gardens; also the Judas Trees, one of which, a standard 40 feet diameter, is a splendid object.

The tall Italian Reed (Arundo donax), which often exceeds 20 feet in height, grows very extensively, and, besides forming a pretty addition to the general appearance of the country, is most useful in the various purposes for which it is applied, either in supporting the Vines, for arbour trellises, Pea sticks, Olive threshing, fencing, &c.

Large quantities of Tomatoes are cultivated here, and are now being planted out, as they were raised last month on borders under the walls, with slight reed coverings occasionally.

COMMON THINGS.

Fruit Tree Protectors.—Pea sticks form a capital protection for fruit trees grown as pyramids, espaliers, or on low walls; they should be stuck in the ground and lean on the trees, so that the spray-like branches are mingled with the blossom-buds—a very small quantity of refuse hay placed among the branches will make the protection still more efficient. It is indeed so like that given by the foliage as not to require removal till the end of May. In the country, where Pea sticks are abundant and can be cut of extra length, they will be found, with a little hay, even for full-grown trees on high walls the cheapest of all protectors.

Broccoli.—The following kinds are especially worthy of cultivation, as they produce heads at a time when, under ordinary circumstances, a succession is usually most required. The Walcheren may be mentioned as one of the most useful in this respect. In order to have a good succession from August to January sow now, although a little earlier would have been better, and afterwards make a small sowing every three weeks, until about the middle of July; in this way a good succession of heads will be furnished until the end of December, and by taking up the plants should the weather be very frosty, and laying them in by the roots in an open shed, and protecting or exposing them as may appear necessary, bearing in mind that they are but little hardier than Cauliflowers, good heads of the last sowing may be kept till the middle of January. This variety is also very useful when sown early in September, and planted under hand-lights, or treated in all respects similar to Cauliflowers. Snow's Superb White Broccoli is also well deserving of general cultivation; from sowings made in May and beginning of June very good compact white heads are produced from the end of November to January, quite superseding Grange's White, which comes in at the same time. Legge's Late White is also an invaluable Broccoli, producing heads at a time when they are most wanted, although the produce is not so fine as that from either of the former. The value of this variety is, however, enhanced by its extreme hardiness, a property which now applies to few other sorts.

Home Correspondence.

Gooseberry Caterpillar.—Your correspondent who has so well described this insect in page 281, will confer a service on his brother gardeners if he will tell them how he managed to catch several hundreds of them in an hour or two in the morning for a few days. Here in Middlesex it was only on the 16th April (the only genial spring day we have yet had) that I observed these flies in any number (a few stragglers having however been previously observed), but their mode of flight prevented me from catching them in any quantity. The following day the wind turned northwards, and though fine, the number of flies was much fewer: since that time, however, they have disappeared with the continued east and north winds; but as they have only hidden themselves, and will again appear as soon as the warm spring weather does come, gardeners ought to be on the look out, and there seems to be all probability of Mr. Grey's reply hereto being in time to be of service. I may mention further that I succeeded in discovering the males of this pest, a circumstance of some little interest, as "Ruricola" in his article on the insect in a former volume of the *Chronicle*, "Rusticus," of Godalming, (who wrote some amusing articles on blight in the "Entomological Magazine"), and Mr. Stephens, in his "Illustrations of British Entomology," have only described the female. The male, instead of having the body of a delicate yellow colour, as is that of the female, has it of a black hue, the tip and sides only pale yellowish; it is also smaller and slenderer than the female. *J. O. Westwood.*

The Osage Orange.—Is it an established fact that this plant is to supersede the Whitethorn as a hedge plant? When I went to South Wales 12 months back, I found there some plants which had been imported from Philadelphia and planted several years; but they had only annually produced a few abortive branches and leaves, and had not made half an inch of wood in 12 months. It is true they were not planted under the most favourable circumstances, nor had they much attention afterwards; but Whitethorn, side by side with them, grew as well as it generally grows, making from 1 to 3 feet of good strong growth every season. In June, last year, I had the ground dug round the Osage Orange, gave it a good coat of dung, and soaked the plants occasionally with manure water. This moved the plants a little, but still I only got a straggling branch here and there, 2 or 3 inches long. I have read the pamphlet on this plant published by an American seedsman 12 or 18 months back, and have seen the representations of hedges, which are certainly first-rate in every respect, but I am sorry my own experience does not accord with that published in America. I fear our summers and autumn are not warm enough to ripen this free-growing plant, that is, if it ever grows freely in this country, and hence it will suffer much from the winter's frost; but I may be mistaken. The examples above specified, however, warrant me in doubting this to be a first-rate plant for our climate, for if it will not grow in a dripping climate like South Wales, or if it will not bear comparison with the Whitethorn there, I fear it will not be of much value through the country generally. *W. P. Ayres, Whittlebury Lodge.* [Is not the "dripping country" the explanation of its unwillingness to thrive?]

Effect of Last Winter on Conifers in Cambridgeshire.—Our situation is high for a particularly lowland country, and the place rather exposed. The subsoil of the district is chalk, but we have a very great depth of loam. P. Hartwegi, planted in 1848, has escaped this and other years' severity. It looks a little yellow during east winds, but has never sustained injury. The following have stood quite untouched this year, viz.: P. Pinea and varieties; P. apulcensis, P. macrocarpa, P. Lindleyana, P. Fremontiana, P. insignis, P. radiata, P. macrophylla, P. monticola, P. maritima, and its varieties; Lemoniana, Mar di Corte, &c.; P. Laricio and its varieties; P. excelsa, P. Lambertiana, P. Montezumæ, P. Russelliana, P. Devoniana, P. Benthamiana, P. rigida, P. inops, P, pungens, P. Sabiniana, P. Ayacahuite, P. brutia, P. Cembra, and variety; P. Mugho, P. Tæda, P. pumilio, P. ponderosa, P. Banksiana, P. Llaveana, P. taurica, P. Gerardiana, P. Nordmanniana, P. tuberculata, Picea Fraseri, P. grandis, P. amabilis, P. Pichta, P. Pinsapo, P. nobilis, Abies Wittmanniana, A. orientalis, A. Douglasi. The three spring tender ones, A. morinda, P. Webbiana, and P. cephalonica, have escaped the winter, and I hope they may escape late spring frosts. P. Teocote, which stood the previous winter, has been killed; P. patula is very much browned; P. Pseudo-Strobus has last year's shoot destroyed, Abies Brunoniana suffered from last year's late frost, and has not at present recovered. The Cypresses have not escaped so well; C. Uhdeana is killed, C. mexicana is injured, but I hope not materially. Some of the C.

Goveniana are injured, and C. funebris; also C. lusitanica more considerably, and C. elegans, but I refer to small plants; Libocedrus chilensis is hardly touched; C. majestica and C. Knighti, both in a rather sheltered position, have stood very well. Juniperus bermudiana is killed to the ground. The following look very well:—Cupressus thurifera, C. glauca, C. Wittmanniana, Juniperus phœnicea, excelsa, J. oblonga pendula, echiniformis, J. ericoides, J. recurva, J. recurva densa, J. chinensis, Thuja pendula, T. aurea, T. flagelliformis, Cryptomeria japonica, varieties Lobbi and nana, Podocarpus coriacea, Cephalotaxus pedunculata and Fortuni, Chamæcyparissias sphæroidea and variegata, Taxus ericoides and Araucaria imbricata. Fitz-Roya patagonica, a young plant put in late in the autumn, has suffered, excepting where protected by snow. At present I have had no success with the P. Grenvilleæ, P. halepensis, P. muricata (which I believe is sufficiently hardy), P. australis, and P. filifolia. The Deodars, excepting those much exposed to the wind, look very well. I venture to add that I must attribute a good deal of damage done in the previous year to having pot-bound plants. Plants have grown and thriven here for some few years, and have afterwards been killed by winter's frost or blown down by a high wind. Upon taking them up I almost invariably find a cause for this in the root. In one case a P. insignis, which had grown from 1½ to 12 feet (and which accomplished 3½ feet in one year), was blown on one side by a high wind in the spring, and the following winter killed. Upon taking it up I found plain symptoms of disease at the roots, all curled up and entangled. It had never taken the least hold of the ground. *Wm. Parker Hamond, Pampisford Hall, near Cambridge.*

Scarlet Geraniums.—Can any of your subscribers account for the following:—Trained to the wall of my greenhouse is a giant scarlet Geranium of three years' growth; about 14 months ago the plant was thinned, and one branch was cut off about 3 feet 6 inches from the ground, and omitted to be taken out. It is now growing vigorously and showing blossom. The branch is about 5 feet 6 inches long. *R. D. Nemill, Wellington, Salop.* [Perhaps the branch has rooted in a mortar-joint.]

Mowing Machines.—Your querist "E. B., Perdiswell," cannot have a better mowing machine than Samuelson's improved Budding's. He says he "has seen this, but it will not suit, in consequence of the travelling wheels not going sufficiently near the edge of the walks." If he looks again he will find that for this purpose these wheels are made so as to be easily removed, after which the machine remains (with the exception of some slight modifications) one of Budding's old machines, and is the best for narrow borders. The great advantage derived from the use of the wheels is in the open lawn; they reduce the power required to work the machine, and, by a simple arrangement of the axle, fix the cutting or revolving knives to any required height, where they are kept, without any care from the operator. Without these wheels the height cut depends on the skill and care of the workman, who cannot help making irregular work, long Grass here and short there, according to the irregularities of the surface. *J. S., Banbury.*

Percepierre (see p. 281).—Allow me to inform your correspondent that Crithmum maritimum is called Percepierre in Guernsey, where it abounds on the rocks surrounding that delightful island. It is often collected for pickling, for which purpose I was told it is excellent. *E. Y.* [And so it is.]

The Argan Tree.—We have at present six healthy plants of Argania sideroxylon in our large tropical house. *I. Vair, Gardener to Lady Dorothy Nevill, Dangstein, Petersfield.*

Frosting Asparagus.—Having noticed early in the winter that a correspondent (see No. 50, 1845) considered it an advantage to expose his Asparagus to the effects of frost, my gardener concluded to try the effect here, and took the covering off two short single rows, set according to the plan recommended in Cuthill's pamphlet. After the unusually hard frost this winter, I may acknowledge that I feared they were much injured; but on examining them on the 13th ult, there were eight heads up, whilst in the two adjoining rows that had been covered, scarcely any were to be seen. Whether it is an advantage or not, I leave to wiser heads to determine, as I purpose sending the whole produce of each of the two beds that were frosted and covered to the meeting of the Horticultural Society, in Regent Street, next Tuesday. At any rate, it will have the effect in future of removing any anxiety I might have in frosty weather, lest the plants were not sufficiently covered. *J. Abell, Limerick.*

Natural Mushrooms in April.—In addition to the account furnished by Mr. Ingram of his early Mushrooms in the open air, I beg to inform you that last year, wishing to grow some ridge Cucumbers under hand-lights upon a slight bottom-heat, I made a bed for that purpose, into which I put some Mushroom spawn, which produced me a moderate crop, principally buttons, and none of more than medium size. Early this spring I distributed half the bed for manure over part of the garden, and left about half the old bed without disturbance. I was surprised to see a crop of Mushrooms springing up in this; and on the 21st of April I gathered a very respectable basketful. Since that time they have continued to appear, and of extraordinary size. This morning I gathered at least half a peck, one measured nearly 9 inches, and several 6 and 7 inches across. That you may see I am not exceeding the truth, I send you an exact copy of the section of one of the stems. *J. B. R. L., Lynn, Norfolk.* [The section in question measured 2¼ inches across.]

Societies.

HORTICULTURAL, *May* 1: ANNIVERSARY.—R. Hutton, Esq., V.P., in the chair. The following new members of Council were elected, viz., his Grace the Duke of Northumberland, Sir S. M. Peto, Bart., and Sir Joseph Paxton, M.P.; *vice* General Fox, G. Rushout, Esq., M.P.; and J. C. Whiteman, Esq., retired. His Grace the Duke of Devonshire was elected president; Dr. Jackson, treasurer; and Dr. Royle, secretary; and as auditors, Messrs. J. C. Stevens and Henry G. Bohn. The annual report from the Council was read, and upon the motion of Sir P. Pole, Bart., seconded by Lord Ravensworth, was adopted and ordered to be circulated among the Fellows,

Reviews.

A Manual of Elementary Geology; or the Ancient Changes of the Earth and its Inhabitants as Illustrated by Geological Monuments. By Sir Charles Lyell, M.A., F.R.S. 8vo, pp. 655. Fifth edition, illustrated with 750 woodcuts. Murray.

This great work stands in the foremost rank of those which are devoted to a consideration of the ancient changes which the earth has undergone. Unlike the author's "Principles," which merely relate to changes of a recent date or now in progress, the volume before us deals with events the nature of which is purely inferential, reveals the causes which led to the formation of the so-called aqueous, volcanic, plutonic, and metamorphic rocks, and thus carries the reader back to the most remote period of the earth's history concerning which we have any positive evidence.

It is superfluous to say that Sir Charles Lyell has renewed his task for the fifth time with consummate ability, and that the reader will find in the work before us all that is most trustworthy in relation to its mighty subject. The account of what geologists call the Wealden formation, that is to say, of the region which comprises within it the whole of Sussex, and part of the counties of Kent, Surrey, and Hants, will be read with peculiar interest, all the facts belonging to that large area having been carefully reconsidered, and embodied in a new description, of which the woodcuts, always good in the volume before us, most especially deserve to be mentioned with high praise. The same may be said of the views now expressed concerning the true geological analogies of the Isle of Wight, in arriving at an opinion concerning which the views of Edward Forbes are expressed in conjunction with those of Sir Charles Lyell.

Works of this nature have too little immediate relation to the main purposes of this Journal to justify us in devoting much space to their consideration. We will therefore only add that, upon the vegetation which existed at the period when coal was formed, we are unprepared to acquiesce in the opinions expressed by the learned author. Adolphe Brongniart calls the carboniferous Flora that of the age of Acrogens, because of the great quantity of Ferns and similar plants now found in the coal measures, and the rarity there of other classes of plants; and this view Sir Charles Lyell thinks may be justified. But we hold to the opinion, formed many years ago, and once supported by experimental investigation, that the remains of coal plants offer no satisfactory evidence concerning the vegetation of England in the remote ages when the beds of coal were formed. All that the remains can be taken to prove is, that at a certain time certain plants existed; but we are not justified in assuming that at the time in question no other plants existed; because under the conditions which enabled Ferns, &c., to resist decomposition, other races as abundant, or infinitely more so, may have utterly disappeared. For ourselves, we regard the whole of the inferences concerning vegetation drawn by geologists from the plants now found in the old rocks, as hasty, and unsupported by anything like sufficient evidence; and we entertain a strong belief that the geological world will one day advocate the same opinion.

Garden Memoranda.

HORTICULTURAL SOCIETY'S GARDEN, TURNHAM GREEN.—No one can doubt that vegetation this spring is at least three weeks or a month behind what it usually is in ordinary years, and therefore there is even thus late in the season little out of doors yet to attract especial notice. The Horse Chesnut is almost the only tree in full leaf. Lime trees have scarcely begun to move. Hawthorns were not in leaf before the 20th ult, and it was the 16th before Standard Almonds were in flower, while in early seasons they are often in blossom in the month of January. The pale variety of Cydonia japonica on the conservative wall is in full flower, and very showy it is, as are also one or two of the earlier hybrid Rhododendrons; but with the exception of these and the red flowering Currant, little else in the open grounds is yet in flower; for although the sun has now become powerful in the middle of the day, easterly winds prevail, and the nights are cold and mostly frosty, while the excessive dryness of the ground which at present exists greatly assists in retarding growth.

Under glass, however, things now begin to wear a different aspect. In the great conservatory both white and red Brugmansias are in full flower, as is also Paulovnia imperialis in the shape of a tree which reaches near the top of the house. The flowers are pale blue, and in form resemble those of a Gloxinia. The tree itself, we need scarcely add, is perfectly hardy; but out of doors its wood never sufficiently ripens to enable it to produce flowers. Camellias are still in blossom, and we also noticed several plants of Salvia gesneræflora covered with multitudes of scarlet flowers of the most brilliant description. This is truly a most useful winter and spring-flowering plant, which requires nearly the same kind of treatment as a scarlet Geranium. Roses are likewise coming into bloom, and trained on the roof was Tropæolum Triomphe de Gand, whose scarlet flowers are extremely showy, and even in a pot this is one of the gayest plants we have, and certainly not so much cultivated as it should be. The shelves were also full of flowering things, such as Heaths, Cytisus, Azaleas, and other plants in pots.

In one of the stoves was the Pilot's cap-like Aristolochia gigas, whose flowers, notwithstanding their disagreeable odour, are prized for the singularity of their shape. The plant is, however, difficult to keep except it is raised from cuttings every year.

In the small greenhouse near the Rose-house a new Clematis, a variety of cærulea, was in flower, and two Sikkim Rhododendrons, glaucum and theæflorum; the former has small pinkish-salmon flowers, each about the size of a lady's thimble, and 24 or so in a cluster at the end of every shoot; the latter has larger buff-coloured blossoms suffused with red, and both are spotted in the upper petals. Even should these not flower out of doors they must be ranked as pretty greenhouse plants at this season of the year. The white R. Gibsoni, *aliàs* formosum, was likewise in blossom, and in addition to the large size of the flowers, they have also the advantage of being exceedingly sweet-scented. Associated with these we remarked the shrubby Calceolaria violacea, a sort with prettily spotted helmet-shaped flowers, quite different from those of the common kinds, and a handsome plant of Imatophyllum miniatum, with a noble head of brilliant salmon-coloured flowers, some 10 or more in number, and these on a plant in an 8-inch pot. The beauty of this fine plant is not near so well known as it deserves to be. In this house were also some well-grown plants of Schizanthus violaceus, and, what is not often met with, an example of Tropæolum azureum. A small plant of Berberis Wallichi was also in blossom here.

Among new things were young plants of Wellingtonia, and we observed several of M. Botteri's seeds coming up; also plants of the Californian Plane tree and Maclura aurantiaca or Osage Orange. Some bulbs from Balaklava were likewise beginning to grow, as were plants of Whitlavia and other new annuals. Some seeds from Mr. Skinner were likewise beginning to vegetate. Eugenia Ugni was coming into flower, and we remarked examples of the White Glycine, which will soon be in flower. We also noticed plenty of young plants of the Palmetto Palm, which is reported to be nearly as hardy as the Chusan Palm, together with offsets of the Gynerium argenteum, or Pampas Grass, which had been separated from the old plant, and struck in a little heat. The old plant, it may be mentioned, though much cut up, is not dead; the outside leaves have been removed, and it is beginning to push again from the centre.

In Ewing's glass wall some of the Acacias and New Holland plants are dead. Tea Roses, however, seem to thrive well in it, and Edwardsia chilensis is now in full bloom. This thrives here perfectly, although it does not succeed on the conservative wall.

In one of the low span-roofed pits erected for Mr. Fortune's Pæonies, were plants of Forsythia viridissima, literally one mass of yellow flowers; these were quite striking, even at a distance; where this plant can have the protection of glass merely to keep its flowers from getting tarnished by the weather, it is certainly one of the most ornamental early flowering shrubs we possess. Camellia reticulata, in a two-light box, has also had some hundreds of blooms on it.

In the orchard-house the young trees in pots are progressing satisfactorily. The red and white flowered Chinese Peaches are in blossom, and very ornamental they are. Apricots, Peaches, and Nectarines are setting their fruit, and the two latter are being disbudded in such a way as to keep their branches near "at home." Figs have a plentiful crop on them, and Cherries and Pears are in flower, as are also Currants. Gooseberries have set their fruit, and appear to be free from both Gooseberry caterpillar and a little red Acarus which has been so destructive to Gooseberry bushes in the open air this year in the neighbourhood of London.

In the Orchard department care is being taken to keep the Peach and Nectarine blooms from frost; in addition to 9-inch coping boards, straw protections, about 4 feet in width, are put under the boards along the top of the wall, off which they are kept by strong twine fixed to the wall at top and to pegs driven into the border about 4 feet from the bottom of the wall. The Harrison woollen net and others of a lighter description are also employed, which will, doubtless, have the effect of saving the bloom, of which there is a fine show. Apricots owing to the late season are not more than 10 days out of flower! Pears on walls are full of blossom, although the latter has been greatly thinned, in order to strengthen what is wanted to remain, and altogether there is every appearance this year of a prolific crop of fruit of all

kinds. The blossoms of standard Pears have not yet begun to expand, and Apples are not even in leaf. Some of the latter have been painted over with a mixture of lime, sulphur, and lamp black, with a view to ascertain whether or not that will keep down American blight. Some young pyramidal Pear trees, presented by Mr. Rivers and Mr. Glendinning, have been planted along the front of the Peach border, together with others from M. de Jonghe.

In the kitchen-garden, collections of different sorts of vegetables have been sown for the purposes of trial, the result of which will be given in succeeding reports. It may be mentioned now, however, that among Lettuces, the hardy Hammersmith Cabbage, the dwarf Black Seeded Cos, and the Bath Cos have stood the best.

FLORICULTURE.

National Floricultural Society, *April 26.*—Mr. Robinson in the chair. On this occasion several seedling Cinerarias were exhibited. Mr. Lidgard sent the following varieties, viz., Blue Beard, small with rather coarse disc; Bridesmaid, white, but no improvement on Kate Kearney; Lady Bathurst, scarcely so good as Mrs. Beecher Stowe; Hector, white with deep lavender edging, but insufficient in breadth of petal; Emperor, white, deep blue edging, deficient in form and substance; Mary Anne, rosy purple, neat second-class flower; Lydia, like Kate Kearney, but hardly so good; Fame, white with rosy purple margin, too much reflexed; Brilliant, pure white, medium margin of delicate azure, compact dark disc, petals slightly indented, good form but rather thin, promising and distinct—a Certificate of Merit was awarded it. Mr. Lockner sent Query, white, broad rosy lilac margin, but only of average merit. Mr. Crockford furnished Morning Star, a flower of little value. Mr. Turner exhibited Emperor of the French, rosy crimson with broad white ring round a dark disc. Rose of England, white, edged with rose. To each of these varieties a First Class Certificate was awarded. From the same Nurseryman also came Lord Cardigan, white, with a broad margin of violet purple; Monarch, shaded plum with brighter centre; Magnum bonum, purplish crimson with a small white ring round a black disc, and Princess Royal. Mr. G. Smith sent Verbena Lord Raglan, bright vermillion, good truss, and habit of Defiance; to this a First Class Certificate was awarded. The same grower also sent four seedling Mimuluses, viz., Portia, Unique, Enchantress, and Lydia; the last, a striking variety, received a Certificate of Merit. Of Pansies there were several. Mr. Turner produced Perfection, yellow ground, with belting of dark maroon, and Constellation, yellow, with broad very dark margin; each of these obtained a First Class Certificate. Two other seedlings, and pans of named varieties, also came from the same exhibitor. Messrs. Henderson, of Pineapple Place, sent a collection of Hyacinths. Mr. Rosher contributed Rhododendron Edgworthi, with large white flowers spotted with lemon, and deliciously fragrant. A Certificate of Merit was awarded to an Epacris named purpurea rosea, a cross between miniata and Tauntoniensis; this came from Mr. Kinghorn. Messrs. Ivery, of Dorking, sent Azalea Admiration, a striped variety.

Calendar of Operations.

(For the ensuing week.)

PLANT DEPARTMENT.

Conservatory, &c.—Look over specimens growing in the borders or beds of this house frequently, in order to regulate the growth, and see they do not become a prey to insects; also keep them properly supplied with water at the root, and in watering be careful to give sufficient to well moisten the soil about the whole of the roots, for mere surface waterings will not serve to keep the plants in a vigorous state, and unless this can be secured weakly growth will be the result. Examine Orange trees carefully for red spider, and if they are found to be at all infested with this pest, lay those in pots or tubs upon their sides, so as to avoid saturating the ball, and give them a liberal washing with the engine; turning them so as to make sure of cleaning every leaf, and this should be done before the blossoms are so far advanced as to be liable to injury. If kept in vigorous health, however, these are by no means subject to red spider, and a liberal supply of manure water at the root, during the growing season, will be of great service in effecting this. Should black fly make its appearance upon the young shoots of those growing in heat, which it is very apt to do, and the plants cannot be conveniently smoked, dip the young shoots in tobacco water made by steeping tobacco in warm water, and straining the decoction through a piece of flannel so as to have it clear, for tobacco water, as frequently obtained from the tobacconist, is so thick and dirty that plants cannot be dipped into it without soiling and disfiguring their foliage. Attend to removing the seed vessels from Azaleas directly the plants go out of flower, and those intended to bloom early next spring should be removed to where they can be kept rather close and warm, in order to induce early growth, and get the flower buds prominent before winter. Such as require more pot room should be shifted before starting them into growth, using good strong rich fibry peat, well broken up and intermixed with plenty of silver sand, which is the most suitable compost for them. Keep young plants of scarce sorts which it is desirable to grow as rapidly as possible near the glass in the cool end of the stove, and attend to regulating the growth by pinching any over-luxuriant shoot, and stopping regularly over when necessary to secure compact growth. Also keep the foliage clear of thrips and afford them plenty of pot-room, and they will make rapid progress and form nice sized plants in course of the season. Young stock of hard-wooded greenhouse plants will now be fairly starting into growth, and in the present unfavourable state of the weather will require very careful attention. Take every advantage of mild days to give air freely, but do not expose the young tender growths to currents of cold drying air by opening the front sashes in every state of the weather. We have invariably found young stock of greenhouse things to do best in cold frames after this season, and their removal from the greenhouse affords more space for the specimen plants; and there is nothing more ruinous to well-grown specimens than the want of sufficient space at this season. Be very careful to give plants of all sizes a proper supply of water at the root, and do not trust this work to any inexperienced hand, but carefully and frequently examine every plant, and see that nothing is either overwatered or allowed to suffer through dryness. In the case of small or moderately-sized plants, there is little difficulty in ascertaining the state of the ball as to moisture, but it is sometimes very difficult to feel certain as to whether a large old specimen is in the right state in this respect; for when a plant becomes weakly through the want of pot-room, or some of the many evils attendant upon age, &c., most of us incline to lay the blame on under or over-watering, and doubtless sometimes judge incorrectly, and the remedy decided upon proves the death of the specimen. With loose bottomed pots this difficulty is avoided, and these are invaluable for large specimens, as the pot can easily be removed in doubtful cases, and the exact state of the soil as to moisture ascertained without the least risk of injuring the ball or roots, and if this was the only advantage gained by the use of these pots they are certainly deserving of the cultivator's preference for large plants wherever they can be obtained. But they are hardly within the reach of the mass of cultivators at present, and if proper care is exercised in the preparation of the soil and potting so that the water will permeate equally through the ball, and moisten the whole of the soil before making its escape by the drainage there will be little danger of the ball becoming either too dry or too wet, provided the old rule of "Water only when necessary, and then thoroughly," is observed.

FORCING DEPARTMENT.

Pineries.—In cases where a regular supply of fruit is required at all seasons of the year, it will be necessary to examine the stock of plants, frequently marking those considered the most likely for fruiting, so as to be able to keep them rather dry at the root for a month or so, which will, in most instances, have the desired effect of checking growth and throwing the plants into fruit. The only effectual method, however, of securing a supply of fruit at any particular time is foresight in the management of the stock, taking care to get the growth well matured in sufficient time to allow of affording the plants a short period of comparative rest, which is the only certain means of inducing them to fruit at any desired season. With plenty of convenience this is easily enough managed, but where the accommodation is limited, it is by far the most difficult part of the culture of the Pine. And in cases where a regular supply of fruit has to be furnished from limited accommodation, it is safer to grow the plants in pots, so as to secure perfect command over the roots, and also be able to move the plants to a cooler pit or otherwise, as may be necessary. Black Jamaicas and Cayennes are the best varieties for winter fruiting, and the stock of these should receive every attention at this season, so as to induce them to make free growth, and a portion of them should be shifted into their fruiting pots as soon as possible. Use every means to afford growing stock a moist atmosphere, which in the present state of the weather is a work that requires much attention, but must be done if the plants are to be kept in first-rate condition. Give air freely, but avoid draughts of cold drying air, and use shading to assist in keeping down the temperature without being under the necessity of admitting cold drying air too freely. Vineries.—In cases where Muscats are grown in the same house with Hamburghs, and other free setting varieties, the temperature must be kept sufficiently high during blooming, and until the berries are fairly set to suit the Muscats; for a crop of these cannot be depended upon from the most healthy Vines, unless they can be afforded a brisk temperature while in bloom and setting their fruit. It will be better, however, to risk having the Muscat bunches somewhat thin than to injure other varieties by maintaining a night temperature of 75°, which is the practice of some good growers: 68° or 70° will be found quite sufficient. Get the borders prepared for planting out young Vines, and if these are started into growth before planting do not keep them too warm, or it will be difficult to prevent their sustaining a check after planting out. Peaches.—Where the fruit is approaching maturity the atmosphere should be kept rather dry, with a free circulation of air, whenever the state of the external atmosphere will admit.

FLOWER GARDEN AND SHRUBBERIES.

Where the beds are filled with spring flowering things the effect of the present arrangement should be carefully examined while the principal part of the plants is in bloom, making a memorandum of any alterations which it may be deemed proper to effect at next planting time. Light well drained soils are already so dry that a good soaking of water will be serviceable to Anemones, Turban Ranunculuses, and many other things which are generally used for the spring decoration of the flower garden. Do not water in the evening when there is the slightest danger of frost, as this might injure the foliage of Ranunculuses, &c.; and give a thorough soaking, which will save labour and be of more use than repeated slight waterings. If the surface can be covered with a thin coat of fine dry soil or sand after watering this will greatly assist in preventing evaporation, and keep the surface of the ground from getting hard and cracking, as is usual in dry weather after heavy waterings. Give every necessary attention to shrubs or trees that have been recently planted, especially large evergreens, keeping the soil about their roots moist by a liberal soaking as often as may be requisite to effect this. In the case of things which are liable to suffer in severe winters when their young wood is not well ripened, watering is sometimes overdone, and we have seen many such things greatly injured through the soil being run together and rendered very unkind for the roots by too heavy and frequent waterings. All such things should therefore be well mulched at once, in order to avoid the necessity of being continually watering. Herbaceous plants lately planted will also require occasional attention with water until they get hold of the soil. If the removal of any large shrubs or trees has been delayed through unfavourable weather, this had better be deferred until we experience a decided change. Get bedding stuffs hardened off as expeditiously as possible, but see that they are perfectly clear of green fly before removing them from the pits and frames, and do not be in too much haste to expose the stock to drying winds and bright sunshine. Encourage any backward plants to make free growth for some time longer, for the beds will be sooner furnished by planting out good strong stock at the beginning of June than by planting weakly ill-prepared plants early in May.

HARDY FRUIT AND KITCHEN GARDEN.

Recently transplanted trees, &c., must be carefully attended to with water. Take advantage of the dry state of the ground to get manure wheeled upon quarters where it will soon be wanted, and see that there is a good supply being prepared for the Celery crop; for without plenty of old rich manure large crisp Celery can hardly be obtained. Directly the weather becomes more favourable get the spring-raised Cauliflowers and Lettuce planted out, if not yet done, selecting for them a sheltered situation and light rich soil. A few branches of evergreens stuck amongst such things after planting, so as to screen them from the sun, is a great protection, and prevents their being dried up until the roots get hold of the ground.

STATE OF THE WEATHER AT CHISWICK, NEAR LONDON,
For the week ending May 3, 1855, as observed at the Horticultural Gardens.

April and May.	Moon's Age.	Barometer. Max.	Barometer. Min.	Temperature. Of the Air. Max.	Temperature. Of the Air. Min.	Temperature. Of the Air. Mean	Temperature. Of the Earth 1 foot deep.	Temperature. Of the Earth 2 feet deep.	Wind	Rain

The highest temperature during the above period occurred on the 6th, 1830, and 12th, 1833—therm. 81 deg.; and the lowest on the 10th, 1853, and 11th, 1838—therm. 27 deg.

Notices to Correspondents.

Covent Garden Market: *I.* You are allowed to sell personally if you choose; but growers at a distance generally find it more convenient to commission some agent to sell for them. ‡

Insects: *J R.* The eggs were most probably deposited in the seeds of the Pinus nobilis whilst on the tree. Can you learn the particulars of the importation of the cones. Thanks for the specimens.—*J H.* The Orange leaves are infested with a scale different from that which is now doing so much injury to the fruit. The leaves should be sponged with warm water and the scales destroyed by hand. Smoking the house when the young are hatching will be useful.—*H.* We found no insects on your Gooseberry twigs, the leaves of which seem small and withered from some other cause. *W.*

Names of Plants: We have been so often obliged to reluctantly decline naming heaps of dried or other plants, that we venture to request our correspondents to recollect that we never have, or could have undertaken an unlimited duty of this kind. Young gardeners, to whom these remarks more especially apply, should bear in mind that, before applying to us for assistance, they should exhaust their other means of gaining information. We cannot save them the trouble of examining and thinking for themselves; nor would it be desirable if we could. All we can do is to *help* them—and that most willingly. It is now requested that, in future, not more than four plants may be sent us at one time.—*Const. Sub.* Primula cortusoides.—*Reader.* The Rhododendron is thoroughly out of health. Perhaps it is grafted. The other is Anthyllis cytisoides.—*A R.* Pinus Pinea—or Stone Pine—probably from Italy.—*S H.* Myoporum lætum.

Roof for a Summer-house: *Const. Sub.* We should use thatch made of Heather. Any handy thatcher could employ it. You will hardly get wooden tiles of a good pattern, if at all, or that will stand.

Sarracenia Drummondi: *R W.* You will find the information you seek respecting this plant in another column. All other Sarracenias should be treated in the same way. ‡

Vanilla: *J M.* If you will read the paragraph with attention you will find that you have misunderstood it. Vanilla ripened years ago at Liége.

Vine leaves: *R R.* The small green excrescences you complain of are harmless. They are induced by too damp an atmosphere and want of sufficient ventilation ‡

Weigela: *Yorkshire.* Your plant is probably too luxuriant to bloom; if that is the case try what effect root pruning has on it. The great point is to get it to make wood no stronger than your summers can thoroughly ripen. ‡

*** As usual, many communications have been received too late, and others are unavoidably detained till the necessary inquiries can be made. We must also beg the indulgence of those numerous correspondents, the insertion of whose interesting contributions is still delayed.

PERUVIAN GUANO, Bolivian Guano, Superphosphate of Lime, Nitrate of Soda, Sugar Scum, and every description of Artificial Manures, Linseed Cakes, &c.
WM. INGLIS CARNE, 10, Mark Lane, London.

PATENT SANITARY SEWAGE COMPANY'S NITRO-PHOSPHATED CARBON OR BLOOD MANURE, 5l. 10s. per ton; delivered in London, bags included. Each ton contains 1350 lbs. Blood and 11 per cent. of Phosphate of Lime.—Agents throughout the country.
22, Lincoln's Inn Fields, London.

THE FOLLOWING MANURES are manufactured at Mr. LAWES' Factory, Deptford Creek:—Turnip Manure, 7l. per ton; Superphosphate of Lime, 7l.; Sulphuric Acid and Coprolites, 6l.
Office, 69, King William Street, City, London.
N.B. Genuine Peruvian Guano, guaranteed to contain 16 per cent. of ammonia. Nitrate of Soda, Sulphate of Ammonia, and other Chemical Manures.

CORN MANURE FOR SPRING SOWING.
CONCENTRATED URATE FOR GRASS, RAPE, AND ALL ROOT CROPS.
SUPERPHOSPHATE OF LIME.
THE LONDON MANURE COMPANY continue to manufacture the above Manures, which have been used with so much success for the last 14 years.
The London Manure Company also supply PERUVIAN GUANO direct from importers' warehouses), Nitrate of Soda, Sulphate of Ammonia, Fishery and other Salts, Bone Dust, and every artificial manure of known value. EDWARD PURSER, Sec.
Office—40, Bridge Street, Blackfriars.

SEWAGE CHARCOAL MANURE.—This highly fertilising Manure, which is Peat Charcoal completely saturated with London Sewage, will be found most efficient for every species of crop; more especially for Peas, Beans, Turnips, Mangold Wurzel, and other root crops. It will produce a greater return for the outlay than Guano or any other Manure at an equivalent value: it also possesses the property of retaining its fertilising power longer than other Manures now in use. It may be obtained at the SEWAGE MANURE WORKS, Stanley Bridge, Fulham, at 4l. per ton, and in quantities less than half a ton, at 5s. per cwt., for ready money only; and in quantities not less than a ton, will be delivered at the London Termini of the Railroads free of charge for cartage. No charge for sacks.
It may also be had from Messrs. G. GIBBS & Co., 26, Down Street, Piccadilly, Agricultural Seedsmen, Agents for London, and from all the other Agents of the Company.

THE LANDS IMPROVEMENT COMPANY, INCORPORATED BY SPECIAL ACT OF PARLIAMENT FOR ENGLAND AND SCOTLAND.—To Landowners, the Clergy, Solicitors, Surveyors, Estate Agents, &c.—Loans may be contracted for the execution by the proprietor or by the Company of every landed improvement, especially Drainage, Building, Clearing, Enclosing, Warping, Irrigation, Embanking, Reclamation, Roads, Planting, Machinery, &c. The plans (of buildings), specifications, and estimates are prepared by the proprietors, and are submitted to the approval of the Enclosure Commissioners. Proprietors may avail themselves of the powers of the Act to recover from the inheritance their own funds to be expended on improvements. They may also apply jointly for the execution of a mutual improvement, such as a common outfall, &c. For forms of application, &c., apply to the Hon. WM. NAPIER, Managing Director, 2, Old Palace Yard, Westminster.

THE GENERAL LAND DRAINAGE AND IMPROVEMENT COMPANY
INCORPORATED BY SPECIAL ACT OF PARLIAMENT.
Offices, 52, Parliament Street, London.
DIRECTORS.
HENRY KER SEYMER, Esq., M.P., *Chairman.*
SIR JOHN V. SHELLEY, Bart., M.P., *Deputy-Chairman.*
George Thomas Clark, Esq.
John C. Cobbold, Esq., M.P.
Sir William Cubitt, F.R.S.
Henry Currie, Esq.
Thomas Edward Dicey, Esq.
William Fisher Hobbs, Esq.
Edward J. Hutchins, Esq., M.P.
Sir S. M. Peto, Bart.
William Tite, Esq., F.R.S.
William Wilshere, Esq.
Empowered to execute Drainage, Road-making, and other Land Improvements, and to Erect Farm Buildings upon Estates under Settlement, Mortgage, or otherwise; or Church property, and without investigation of Title to charge the whole outlay and expenses upon the Estate, to be repaid by instalments spread over any period determined by Landowners within the limits of 25 years for Drainage and Roads, and 31 years for Farm Buildings. Landowners may arrange with the Company for the execution of the works by their own agents, with the use of their own or the Company's Capital. WILLIAM CLIFFORD, Sec.

THE PATENT NITRO-PHOSPHATE OR BLOOD MANURE COMPANY.—Provisionally Registered pursuant to the Act 7 & 8 Vict. c. 110.
Trustees.
Abel Smith, Esq., Jun., M.P., 2, Halkin Street West.
Charles Dimsdale, Esq., Essendon Place, Herts.
Edward Ball, Esq., M.P., 8, Belgrave Road, Pimlico.
Major-Gen. Hall, M.P., Weston Colville, Linton, Cambridge.
John Brady, Esq., M.P., Warwick Terrace, Belgrave Square.
Directors.
Chairman.—Jonas Webb, Esq., Babraham, Cambridgeshire.
Deputy-Chairman.—John Sharp, Tower Villa, Queen's Road, Regent's Park.
Edward Bell, Esq., Tottenham, Middlesex.
John Clayden, Esq., Littlebury, Essex.
Richard Hunt, Esq., Stanstead Abbot, Herts.
Thomas Knight, Esq., Edmonton, Middlesex.
Robert Leeds, Esq., West Lexham, Norfolk.
Robert Morgan, Esq., 72, Camden Villas, Camden Town.
Thomas Nash, Esq., Great Chesterford, Essex.
James Odams, Esq., Bishop Stortford, Herts.
John Collins, Esq., Middleton Square, Pentonville.
With power to add to their number.
Bankers.—Messrs. Barnett, Hoare & Co., Lombard Street.
Auditor.—James Caird, Esq., Baldoon, and 9, Little Ryder Street, St. James's.
Solicitors.—Messrs. Kingsford & Dorman, 23, Essex St., Strand.
Secretary and Chemist.—James Taylor, Esq., F.C.S.
MANUFACTORY, PLAISTOW MARSHES, ESSEX.
The Directors of the above Company beg to call the attention of their friends and the Agricultural Community to their Blood Manures for Corn and Turnips, which have been used with the greatest success in all parts of England, and to assure them that having now erected commodious Works, with every suitable convenience for carrying on the manufacture on a large scale, under the management of an experienced practical Chemist, the Agriculturists of this country may depend upon having a manure of proved high quality, which the Directors guarantee to be genuine. It is sent out in the form of a fine friable powder, which may be sown by the drill or hand with the utmost facility.
They beg to caution the public against the attempts of spurious imitators, who, since the introduction of this Manure, have proceeded to make one possessing similar qualities. As security, they sell to the purchaser, every bag is marked "Odams' Patent Blood Manure," and sold only by the authorised Agents of the Company.—Corn and Grass Manure, 7l. 10s. per ton.
Directions for Use.—From 2 to 3 cwt. per acre, according to the condition of the soil. It may either be drilled in with the Seed, or sown broadcast; if the latter, it should be well harrowed in.
Turnip Manure, 6l. 10s. per ton.
Delivered at any Railway Station or Wharf in London.
Applications to be made to ODAMS, PICKFORD, & KERR, Agents for the above, 35, Leadenhall Street, London.

TURNIP SOWING.—The Undersigned beg to offer their valuable Supherphosphate of Lime (See "Royal Agricultural Society's Journal," Vol. VI., Part 2), Turnip Manure, and Nitro-phosphate or Blood Manure.
Also on sale, Guano, Nitrate of Soda, Gypsum, Bone-dust, Sulphuric Acid, Salt, and all other Manures of known value. Agents for the sale of Peat Charcoal.—Apply for Prices Current to MARK FOTHERGILL & Co., 204A, Upper Thames Street, London.

COLLEGE OF AGRICULTURE AND CHEMISTRY, AND OF PRACTICAL and GENERAL SCIENCE, 37 and 38, Lower Kennington Lane, Kennington, near London.
Principal—J. C. NESBIT, F.G.S., F.C.S., &c.
The system of studies pursued in the College comprises every branch requisite to prepare youth for the pursuits of Agriculture, Engineering, Mining, Manufactures, and the Arts; for the Naval and Military Services, and for the Universities.
Analyses and Assays of every description are promptly and accurately executed at the College. The terms and other particulars may be had on application to the Principal.

ARTIFICIAL MANURES, &c.—Manufacturers and others engaged in making ARTIFICIAL MANURES may obtain every necessary instruction for their economical and efficient preparation, by applying to J. C. NESBIT, F.G.S., &c., Principal of the Agricultural and Chemical College, Kennington, London. Analyses of Soils, Guanos, Superphosphates of Lime, Coprolites, &c., and Assays of Gold, Silver, and other Minerals, are executed with accuracy and dispatch.
Gentlemen desirous of receiving instructions in Chemical Analyses and Assaying, will find ample facility and accommodation at the College.

CHEMICAL ANALYSIS.
MR. H. MEDLOCK (formerly Chief Assistant in the Royal College of Chemistry) begs to inform Agriculturists that he undertakes the Analysis of Soils, Manures, &c., on moderate terms. Mr. Medlock also gives instruction to Gentlemen in Agricultural Chemistry at his private Laboratory, 20, Great Marlborough Street, London.

THE CONSULTING CHEMIST of the Royal Agricultural Society of England has removed his Laboratory to 15, Welbeck Street, Cavendish Square, where all communications and substances for analysis should in future be addressed. The Laboratory is open to Gentlemen wishing to study Agricultural Analysis, for which purpose it offers considerable advantages.

TESTIMONIAL TO J. B. LAWES, ESQ.—The Committee beg to inform those interested in the above undertaking, that the New Laboratory is expected to be ready for presentation in May or June, until which time the Subscription List will remain open, to afford an opportunity to any who may still wish to associate their names with this acknowledgment of Mr. Lawes' services.
Communications to be addressed to
Mr. W. KERL, Hon. Sec., Harpenden.

TO ARTIFICIAL AND CHEMICAL MANURE MANUFACTURERS AND MANUFACTURING CHEMISTS.
MR. COOKE, CHEMICAL ENGINEER & MANUFACTURING CHEMIST, contracts for the erection of Sulphuric Acid Chambers, and Chemical Plant generally on the most approved forms. Practical instructions from 12 years' experience in the trade given in the working of Acid Chambers, and in the manufacture of all kinds of Artificial Manures, Superphosphates, and Guanos. Receipts for the best mixtures furnished, and other information on application.—For terms, &c., apply by letter to 6, St. Thomas Terrace, Newcastle-on-Tyne.

SPOONER'S PATENT WATER AND MANURE DRILL.—Manufacturers: TASKER & FOWLE, Andover, Hants; and GARRETT & SONS, Saxmundham, Suffolk, to whom orders may be sent; or to the Inventor and Patentee, W. C. SPOONER, Eling, Southampton.

CAUTION.
PARKES' STEEL DIGGING FORKS AND DRAINING TOOLS.
Whereas very inferior descriptions of Steel Digging Forks are now manufactured and sold, and I have been informed that purchasers of the same have believed them to be the same as those manufactured by me, and to which the Royal Agricultural Society and numerous Agricultural Societies' prizes have been awarded, I hereby respectfully inform the public that every Fork manufactured by me is stamped with my trade mark "J. P.," and that Messrs. BURGESS & KEY, of No. 103, Newgate Street, London, are my sole Wholesale Agents, and I have authorised them to replace to the purchaser every Fork of my manufacture found defective; they will also on application send Wholesale and Retail Price Lists, &c., post free. FRANCIS PARKES & Co.

SAMUELSON'S REGISTERED LAWN MOWING MACHINES. To cut 16, 19, 22, and 25 inches wide. The Registered Improvement renders unnecessary the great care requisite in the handling of these Machines on the old plan. All that is now required can be done *by any unskilled labourer*, who has only to push the Machine before him, the Registered Adjustment insuring a clean cut of uniform height, and preventing the knives from cutting into the soil, however uneven the ground may be. Illustrated Price Lists, with copies of Testimonials, and a Catalogue of his other Agricultural Implements, may be procured, post-paid, on application to the Manufacturer,
B. SAMUELSON, Britannia Works, Banbury, Oxon.
The above may also be procured at the principal Agricultural Implement Depôts in London, and of all respectable Ironmongers and Seedsmen in the country.

CLAYTON, SHUTTLEWORTH, AND CO.'S PRIZE PORTABLE STEAM ENGINES, AND COMBINED THRESHING, STRAW SHAKING, RIDDLING AND WINNOWING MACHINE may be seen at their London Establishment, 6, Fitzroy Terrace, New Road, where all information relative thereto can be obtained. These Machines are constructed to horn Barley, and make a perfect separation of the chaff from the pulse. They are fitted with Elevators, which deposit the grain into bags, and beyond the feeder of Machine require no hands except to take away the Corn, &c, as threshed, the whole of the operations being performed by self-acting machinery, whereby the Corn, Straw, Chaff, and Pulse are delivered in the places assigned for them.
C. S. & Co. have paid special attention to this class of Machinery, and Fixed Barn Machinery, and from the position they have taken at the Royal and all the leading Agricultural Shows of England, flatter themselves that for efficiency, durability, and simplicity, their Engines and Machines are not surpassed by any other maker in England. All letters forwarded to the Works at Lincoln will have immediate attention; and Illustrated Catalogues forwarded to all parts of the kingdom postage free.

STEPHENSON AND PEILL, 61, Gracechurch Street, London, and 17, New Park Street, Southwark, Manufacturers of Copper Cylindrical and Improved Conical Iron BOILERS, and Conservatory and Hothouse Builders, either in Wood or Iron, respectfully call the attention of the Nobility, Gentry, and Nurserymen to their simple but efficacious method of warming Horticultural and other Buildings by Hot Water.
From the extensive works they have executed, references of the highest respectability can be given, and full particulars furnished on application.

SCYTHES.
BOYD'S PATENT SELF-ADJUSTING SCYTHES may be had of the Manufacturers, WILLIAM DRAY & Co., Swan Lane, London; and of all Ironmongers and Seedsmen. A liberal allowance to the trade.

WATERPROOF PATHS.
BARN AND CATTLE SHED FLOORS.
THOSE who would enjoy their Gardens during the winter months should construct their walks of PORTLAND CEMENT CONCRETE, which are formed thus:—Screen the gravel of which the path is at present made from the loam which is mixed with it, and to every part of clean gravel add one of sharp river sand. To five parts of such equal mixture add one of Portland Cement, and incorporate the whole well in the dry state before applying the water. It may then be laid on 2 inches thick. Any labourer can mix and spread it. No tool is required beyond the spade, and in 48 hours it becomes as hard as a rock. Vegetation cannot grow through or upon it, and it resists the action of the severest frost. It is necessary, as water does not soak through it, to give a fall from the middle of the path towards the sides.
The same preparation makes first-rate paving for BARNS, CATTLE-SHEDS, FARM-YARDS, and all other situations where a clean, hard bottom is a desideratum. May be laid in winter equally well as in summer.
Manufacturers of the Cement, J. B. WHITE & BROTHERS, Milbank Street, Westminster.

TANNED NETTING, for the protection of Fruit Trees from frost, blight, and birds, and for the security of fresh sown seeds, either in Gardens or Fields, at 1d. per square yard; 200 yards, 14s.; 500 yards, 30s.; 1000 yards, 50s. Scrim Canvas, for Wall Fruit.—At EDGINGTON and Co.'s, Rick Cloth, Tent, and Waterproof Cloth Manufacturers, 17, Smithfield Bars, City, and Old Kent Road, Southwark; Emigrant Outfitters, Ship Chandlers, and Export Merchants, Brunswick Street, near the East India Export Dock, Blackwall.

FRUIT TREES, POULTRY, RABBIT, SHEEP, AND LAMB FENCING.—Worsted Netting, to protect the Bloom of Peach, Nectarine, and other Trees, Flower or Seed Beds, from frost, blight and birds, 2 yards wide, 5d. per yard. New Twine Netting (tanned if required), 1 yard wide, 2d. per yard; 2 yards wide, 4d. per yard; 4 yards wide, 8d.; half-inch Mesh do., 2 yards wide, 8d. per yard. Tanned Netting, 2 or 3 yards wide, 1½d. per yard; 4 or 6 yards wide, 3d. per yard. Elastic Hexagon Garden Net, or Scrim Canvas, 4½d. per square yard. Cocoa-nut Fibre, or Hemp Sheepfolding Net, of superior quality, 4 feet high, 4d. to 6d. per yard. Rabbit Net, 4 feet wide, 2d., 6 feet wide, 3d., 8 feet, 4d. per yard. Each edge corded, ½d. per yard extra, suitable for Poultry Fencing. Square Mesh Cricketing Net, fix its full width and length, made of stout cord, 3d. to 4d. per square yard; this is the best article for Fencing against Fowls, Cats, &c.—W. CULLINGFORD'S, 1, Edmund Terrace, Ball's Pond, Kingsland, London.
A 20-yard Drag Net, with purse complete, 2l. 10s.; a Single Walled Drag Net, any length and depth, 1s. per square yard; Casting Nets, complete, 1s. per yard, measured round the lead line; Flue Nets, any size, 1s. per square yard complete. Minnow Nets, Eel Nets, and Landing Nets equally cheap, all warranted first-rate quality and workmanship.

GALVANISED WIRE NETTING FOR GAME AND SHEEP FENCING, AVIARIES, PHEASANTRIES, &c.
2 inch Mesh, light, 6d. per lineal yard, 2 feet wide.
" strong, 8d. " "
Netting of any size or quantity, and Fencing of all kinds, supplied on the shortest notice.—WILLIAM DRAY & Co., Manufacturers, Swan Lane, Upper Thames Street, near London Bridge.

IMPROVED MOWING AND ROLLING MACHINE.
ALEXANDER SHANKS AND SON, Arbroath, Forfarshire, Inventors and Sole Manufacturers, respectfully solicit the attention of the Nobility, Gentry, and Gardeners to this Improved Machine for Mowing and Rolling Lawns. The Machine is in operation in the Royal Gardens at Windsor Palace, Buckingham Palace, and at Osborne, in the Botanical Gardens at Kew, Regent's Park, Manchester, Sheffield, &c.; at Blenheim Palace, Trentham, Cleveden, Elvaston, Broadlands, Woburn Abbey, Clumber, Lilleshall, Castle Howard, Shrubland, Eridge Castle, Enville Hall, Tiptree Hall, Chatsworth, and in many other of the principal gardens in the kingdom as well as in the United States, British America, and on the Continent, where its merits have been fully proved, and its success established.
The machine is made to cut the breadth of 42, 30, 20, and 15 inches respectively, is exceedingly durable, easily managed, and adjusted to cut to the length required. The execution of the work is far superior to what may be attained by the most skilful mower, while at the same time a great saving of labour is effected, and the turf much improved. By the largest machine a Scotch acre may be mowed, rolled, and the Grass collected in one hour.
A. S. and SON have much pleasure in stating that they have made considerable improvements in their 15-inch or hand machine this year, by which the draught is considerably lessened. This machine combines all the merits and advantages of the larger machines with firm and secure construction, and is admirably adapted for borders and for lawns of no great extent.
ALEXANDER SHANKS and SON also respectfully solicit notice to "Fleming's Weeding or Salting Machine" for destroying weeds in gravel walks, court-yards, drives, &c. This machine is now in operation in many parts of England, where it has given ample satisfaction as the best and most economical means of thoroughly keeping down weeds or Moss
Further particulars with testimonials and prices, may be had on application.

The Agricultural Gazette.

SATURDAY, MAY 5, 1855.

MEETINGS FOR THE ENSUING WEEK.
WEDNESDAY, May 9—Agricultural Society of England.

IT appears that in our report last week of Mr. TANQUERAY'S sale we made two or three slight mistakes, which we now correct. "Lady Barrington," purchased by Lord BURLINGTON for 170 guineas, is put down as "dead"—a misprint of "Do."—Lord BURLINGTON having been the pur-

chaser also of the preceding lot. "Oxford 11th," purchased by Mr. Gunter for 500 guineas, is priced 525 guineas. "Lady Iris," marked "dead," was not so—she was purchased by the American firm, Becar and Morris, for 90 guineas. In calculating the averages, too, we are corrected by our correspondent, Mr. Frere, and with the alterations now made they will stand as follows: 77 cows and heifers at 5634 guineas = 76*l.* 16*s.* 6½*d.* each; 24 bulls at 1837 guineas = 80*l.* 7*s.* 4*d.* each; or 101 head of cattle, 43 of which are under 12 months old, at 7844*l.* 11*s.* 0*d.* = 77*l.* 13*s.* 4*d.* each. And if any further evidence of the estimation in which the short-horn breed is at present held be wanting, it will be found in the circumstance that our contemporary, the *Mark Lane Express*, tells the farmers of this country that this price "is not, for an average, a very extraordinary one." We may be sure of this—that the competition amongst English breeders alone would never have raised it so high. It is the extraordinary demand for certain strains of the breed in America coming into opposition with the sturdy resolution or patriotism, as we may call it, of a few amongst ourselves that has driven prices up so high—and produced this extraordinarily high average—for so we may surely call that which stands fourth in the list of short-horn sales since the breed acquired its name.

Charles Colling's 47 sold for more than 151*l.* each; Robert Colling's 61 fetched 128*l.* 16*s.* each; Lord Ducie's 62 sold for 151*l.* each; and Mr. Tanqueray's 101 fetched 77*l.* 13*s.* each. Both Lord Spencer and Mr. Bates, the one realising 68*l.* 17*s.* and the other 67*l.*, come after Mr. Tanqueray, and the Hendon sale may therefore rank as one of the very few "events" of which the breed can boast.

On Friday of last week Mr. Strafford conducted the sale of the small herd belonging to the late Mr. Bolden, at Hyning, near Lancaster. The sums realised will be found in another column. Amongst them is the sum of 220 guineas for "Lady Hopetown," bought by Mr. Torr—a price which does credit to Mr. Booth's breeding. And there are other particulars to which reference might be made in illustration of the influence of Mr. Bates, such as the average price—53 guineas—of the six calves by the "Duke of Cambridge," the bull sold at Hendon to Sir C. Knightley for 280 guineas; these calves were respectively 5½, 5, 4, 4, 2½, and 2 months old! But to this and some other particulars bearing on this subject we must refer another time.

We have lately received some specimens of Wheat from a rich black loam on a limestone bottom confirmatory of our remarks at page 226, and as our correspondent observes, so neatly cut off at the base as to make it difficult to imagine that the mischief is not due to the attacks of wireworm during the fine weather at the commencement of January. That the wireworm is not to blame we were, however, fully convinced by finding, together with a total absence of wireworms, the connection between the seed and dead stem still retained, where the plants were taken up with sufficient care. Amongst a multitude of cases our correspondent found the connection between them maintained in one case only when the plant was gently drawn out from the ground, and in this the grain had been partially ergoted, and had produced three bright blue fungi, which were undoubtedly the Cordyceps purpurea, Fr.; which, according to the discoveries of Tulasne, detailed some months since in this journal, is the fully developed state of the ergot. Tulasne and others had already observed that partially ergoted grains would germinate, but perhaps the Cordyceps has not been found before under such circumstances.

A portion of the field from which the specimens before us were derived, is sown with winter Beans, of which three-fourths have entirely perished. In that part of the field only which was covered with snow they are bright and healthy. A portion of those from exposed spots which show some signs of vitality accompanied the Wheat, and it is clear that they are affected precisely in the same way as the Wheat. A large portion of the part above ground is dead, and though the heart and a portion of the stem below the first leaf show some life, that part near the cotyledons is either dead or dying, the deep brown tint extending in some cases to the very centre. No weather, however genial, can recover plants whose tissues are decaying from the effect of frost, while the effect of mildew winds is daily more and more evident, where the plant was merely dwarfed, or the herbage only was affected. Whether the diseased condition of the Wheat crop be entirely due to the frost or not, or whether the system of metallic dressing may have aggravated the evil, we do not the less insist on the superior safety of other modes of steeping. Sulphate of copper is perhaps the least harmless of those substances which are commonly used, for seeds which have been steeped in a solution of that salt retain their vitality far longer than those to which arsenic or corrosive sublimate have been applied. The sulphate of soda and lime would probably, if tried carefully, prove so efficacious as to supersede all more questionable and dangerous applications. *M. J. B.*

EXPERIENCES IN LAND DRAINAGE.

No. III.—During the last 30 years I have drained many thousand acres. The result in all cases was highly satisfactory—the tenants being generally willing to pay 6½ or 7 per cent. on the expense, and the advantage to them I am aware greatly exceeds that interest. The drainage I have adopted is the parallel system. For some years I have allowed no drainage under 3½ feet deep in hard land, and in moss or bog 4½ or 5 feet. At one time (20 years ago) our drains were only 27 and 30 inches, but experience has shown us the great advantage of deeper drains. Our present drains are 3½ feet deep at 24 feet distance.—We have no lowland for permanent pasture, our drainage in moor-lands for permanent pasture being only a small open cut for surface water, at an expense of about 3*l.* per thousand rods, but of incalculable advantage in sheep walks.—The direction of our minor drains is *with* the fall. We do not regard the furrows—the land in this district being sown out flat.—I have used 2-inch and 2½-inch pipes for minor drains, and 4-inch to 6-inch tiles with soles for leaders. Collars or socket-pipes have not been used in this district, although I believe they ought to be. We have generally stones thrown out of drains, with which we fix the joints of pipes very firmly.—I have not tried the practice of giving air at places to drains, and do not consider it at all necessary.—The average number of acres to one outlet I cannot accurately say; perhaps 8, 10, or 12 acres, according to circumstances.—We have great variety of soil: peaty soil upon clay or till, or a good red earthy soil with more or less of clay upon rock, till, or clay. We have a great variety of geological formation, but chiefly a second-class retentive soil upon the clay slate formation.—We are from 10 to 400 feet above the level of the sea.—The fall of rain here is, perhaps, as great as any part of Britain. In conclusion I believe there is no expenditure of capital more profitable than that of drainage, and few measures have done more good than the Government grant for that purpose. I believe if the money so absurdly expended in promoting emigration had been laid out in drainage it would have been immensely more beneficial, both in contributing to the comforts of the poorer classes and in promoting the prosperity and wealth of the community. In some cases a tract of land not worth 50*s.* has been, by drainage, made worth 50*l.* a year, and whole farms or estates have been even tripled in value by drainage, followed by a good system of farming. *G. Guthrie, Rephad, Stranraer.*

No. IV.—The greater part of Lord Yarborough's estate in this county that required draining has been drained by his tenants (his lordship providing the necessary tiles) during the last 25 years. Up to about four years ago the drains were put in from 18 to 24 inches from the surface, but during the last four years a great part of these have been taken up, and put in not less than 3 feet deep. No difference is made between arable and Grass land. The soil generally is clay, with the subsoil of the same character; where the latter has sand veins, or is at all gravelly, a greater depth is adopted—in some few cases they are 5, 6, and even 8 feet deep, the object being to go wherever the water is. On the strong soils, 3 feet draining is found so far to be effectual; the system is to drain down each furrow, the lands being generally about 8 yards wide. Egg-shaped pipes, 2¾ ins. by 1½ in., without collars, have been partially used, but open tiles (with sides where necessary) have been more generally used, and are preferred. The average depth of rain-fall in the neighbourhood is a little over 20 inches. *Stephen Gibbons, agent to the Earl of Yarborough, Brocklesby Park.*

No. V.—The result of our drainage operations on all descriptions of land has been most satisfactory. I believe nothing pays better than draining land.—The drainage adopted has been generally on the parallel system, but that must depend a good deal upon the nature of the ground and the fall.—The prevailing depth of the drains is about 3 feet.—I have not laid down the drains quite so near each other on Grass land as on arable.—The direction of the minor drains has been generally with the fall.—I have found 2-inch pipes answer best for the minor drains; I would not advise that smaller should be used on any ground. I have never used collars, as I think they would have a tendency to displace the pipes and destroy the regularity of the channel.—I have not sufficient experience to say if there is any benefit by giving air at places to either main or minor drains.—The average number of acres discharging at the several outlets is about 3 acres, sometimes more.—What is the soil and subsoil? Pebbly gravel, sometimes loamy, for the soil; the subsoil generally a stiff clay.—We are situated here in what is called the London Basin, which consists of a great depth of stiff clay, overlying the chalk which crops out at Ware and Hertford, but is at too great a depth to be worked in this vicinity. The valley of the Lea consists of a great depth (in some places 8 or 10 feet) of loam (brick earth). The sides of the hills are covered in many places with beds of gravel, which dip under the loam, and lay immediately over the clay. This is on the Hertfordshire side of the river. On the Essex side the clay rises again after passing under the river, and there is little or no gravel. The marshes close to the river consist chiefly of black peat or decomposed vegetable matter, intermixed occasionally with beds of gravel, with clay underneath. The surface of these marshes is evidently higher than it was originally, and if drained would contract like a sponge, and sink again. I doubt much whether they can be drained to advantage. The best mode of improving them would be to dig up the clay and spread it on the top, so as to consolidate them. Great injury is done to the land by heading up the water for the navigation and the mills.—We are about 100 feet above the sea level. Hertford is 96 feet above the high-water mark at the Thames.—I am quite convinced, from experience, that nothing pays better than draining if well done, and the drains are not placed at too great a distance. I have one field on my estate which was utterly worthless until drained. It would not grow the poorest Grass. It now produces good crops of corn and roots. But I strongly advise that whatever is done in draining should be well and effectually done, and that the pipes should never be less than 2 inches. I am of opinion, also, that although the water will find its way down to very deep drains, say 4 or 5 feet, this does not obviate the necessity of close draining. We are also less careful than we ought to be in forming the outlets. What is much wanted is a good practical work on drainage, similar to Leclerc's "Traité de Drainage," a French work. *G. T. Bosanquet, Hoddesdon.*

No. VI.—My experience of drainage operations has been quite satisfactory where the drains have been put in sufficiently deep. I have adopted a parallel system generally. The depth of drains has been from 3 ft. 6 in. to 4 ft.; but where springs were to be cut off, oftentimes far deeper. Most of the land in this neighbourhood has been set out in high and crooked ridges; therefore, in draining the arable I have totally disregarded the furrows, and have put in the drains parallel to each other, at distances varying, as the soil might be more or less porous, looking to have the ridges levelled and straightened; but on the pasture I have, for the most, drained up the old furrows, if the land was stiff, and the ridges high; but otherwise, where the land was porous and required fewer drains, at wider intervals. The direction of the minor drains has always been with the fall of the ground, unless the fall was very rapid; in that case they have, in some instances, been placed diagonally with respect to the fall. For the minor drains I have used 1¾ inch pipes, and for the mains 3 inch pipes, unless I had to bring a larger quantity of land than I have usually done into one head; then, in that case, pipes of a larger diameter have been used towards the lower end of the main drain. Collars have been occasionally resorted to, but only in those parts of the drains where spots of running sand or fine gravel were met with. I have not any experience as to giving air, either to the minor or main drains. I did not believe it needful. I have seldom brought more than 5 or 6 acres into one head; perhaps it might have been better had I done otherwise, in which case I should have had fewer outlets to look after. It is certainly desirable, where the main outlet is liable to occasional floods, that a considerable quantity of land should empty itself at one point, whereby a strong under current is created at those times, which will effectually keep the mouth clear of mud till the flood abates. The soil here is blue lias clay, at the foot of the oolite limestone hills, mixed with diluvial sand and gravel in spots. The clays are very calcareous, and even in the stiffest parts, when you go down to the depth of 4 or 5 feet, a grey marl is mostly met with, which is considerably porous and contains a good deal of water. My estate lies at the foot of the oolite ranges of limestone hills in the parish of Haresfield, six miles below Gloucester, on the Bath and Bristol roads, and about two miles from the river Severn. On our hill we have the remains of an ancient British encampment (which gives a name to the parish), a portion of which was fortified in after times by the Romans, where they had a beacon, forming one of a chain of fortifications extending from the lower Avon, near Bristol, to the Cotswold Hills, in Gloucestershire. On the south-west of the island, where we are situated, and exposed to the westerly winds which blow from the Bristol Channel, we probably have our full share of rain—I should think a larger quantity than falls to the lot of those dwelling in the more midland and eastern counties. *Daniel J. Niblett, Haresfield, Gloucestershire.*

No. VII. The system adopted is and has been parallel wherever the land permits. The depth of the drains is not less than 3½ feet. Here are few minor drains; the drains are independent of each other, and their direction is with the fall, and they empty themselves each separately into an open ditch on the lower side of the hedge. But little pipe has been used; the material used being thin slaty stone placed edgeways a foot high at the bottom of the drain, on which is from 10 to 12 inches of stone broken very small; the top of the drain is then filled with soil. There does not appear to be any necessity for air-holes. Our fields are generally not exceeding from 10 to 20 acres, and as each drain is independent of another, the quantity of land drained by each is very small. The soil and subsoil various, perhaps in every field; in some parts loam with a clayey subsoil; or clay with a soft slate stone beneath, such as is used for the drain. The old red sandstone is the geological formation. *John Arkwright, Hampton Court, near Leominster.*

P.S. I tried 1½ inch pipe, but in some places found it choked with a fibrous plant or root-like vermicelli.

TRADE MEMORANDUM.

The information communicated to your readers in the *Gazette* of the 7th inst., relative to the proceedings of certain parties resident in Manchester and its vicinity, seems to me exceedingly like the doings of a correspondent who in 1853 dated his favours from "36, *Lord Street, Hulme, Manchester*," and who succeeded in victimising several parties, inducing them to forward live stock, butter, and other agricultural produce to his kind order. I should have no hesitation in giving his name, or the name he assumed, as it might perhaps save others from being duped, as I own I was by the fellow. But the inquiries I made at the time showed that he had used other names in the course of his transactions. Manchester has acquired a very unenviable notoriety in swindling, and I would strongly advise any one favoured with orders from that quarter to look upon them with a considerable degree of suspicion, as the names, or what are apparently the names, of really respectable people are often assumed for the purpose of deceiving the unwary. *One who was Duped.* [There is a very efficient Trade Protection Society in Manchester, from which information may be obtained.]

ON GREEN FOOD IN FEEDING.

The feeding of bullocks has been of late much discussed in the agricultural journals and elsewhere. It is singular that such a variety of opinions, such a diversity of practice, and so great a difference in expense, should exist at the present day on a subject of every year's experience from time immemorial, and that by thousands of agriculturists. Amongst an eminently practical people, as we are reputed to be, it would have been a natural presumption that the mode and cost of feeding a bullock in the shortest time, and on the most economical plan, would be as well established as any proposition whatever; the only deviation being the time required for the operation; and this would depend on the age, the breed, and the condition of the animal put up. Had this been the occupation of the merchant or manufacturer, instead of the farmer, such a discrepancy would not have existed at this day. Hitherto, exact experiment, carefully noting weight, measure, cost of food, &c., has not been an attribute of the farmer. Such alone will furnish a sound foundation for reliable practice, for which Mr. Lawes has set us an admirable example.

I will presently give some particulars of the feeding of some bullocks last winter; but my immediate object is to repeat a protest I have made from time to time against the prevailing practice of giving to *feeding* animals a very large quantity of roots daily, and that in a neat state. When I commenced feeding bullocks, some years ago, I depended mainly on the experience of others, and was in the habit of noting down the allowances of the different kinds of food recommended in the agricultural periodicals, and otherwise, by men of reputed authority in such matters. The quantity of roots usually recommended I have observed to be from 1 to 1½ cwt. per diem, and for large bullocks even up to 2 cwt., and that without admixture.

Now, what is the object we propose to accomplish? It may be assumed for our present purpose we are dealing with animals at maturity in point of growth, that the skeleton is fully developed, and that we have only to accumulate flesh and fat. The first consideration would seem to be, what is the food which, at the least cost, contains the largest proportion of those elements which build up muscle and fat, and is at the same time palatable to the animal. General experience points to the various roots grown on the farm as best fulfilling the latter condition; but when it is borne in mind they contain on an average somewhere about 88 per cent. of water, the next point for consideration is, how we can combine with this quantity of fluid as much solid food of an ordinary kind (whether hay, straw, or chaff) as may be requisite, having reference to the capacity of the stomach, and that degree of healthy action which is essential to the due assimilation of the more nutritious portions of the food. It must ever be borne in mind that it is not the quantity of food put into the stomach of the animal which accomplishes the object in view, but that which is thoroughly digested and assimilated by the healthy action of the viscera. When animals are in a state of rest, and consuming food so mixed, I have observed that, with water constantly before them, they take very little, unless the more nutritious food superadded be of a heating nature, such as Pea or Bean-meal in too large a proportion: the safest course is to combine crushed Linseed with those articles. Such considerations led me to doubt the expediency of making the chief food of fattening animals *that*, nine-tenths of which consist of water, and more especially mixed with more solid food. The setting before a bullock half a cwt. of neat roots the first thing in the morning, some hours afterwards their allowance of more solid and nutritious food, and repeating the feed of roots in the evening, appeared to me an irrational proceeding; and, on the other hand, that a due mixture of the solid and fluid foods would probably aid the proper digestion of each. I resolved therefore to diminish the quantity of roots which I had generally heard recommended one half—viz., to from 70 lbs. to 80 lbs. per diem, according to the size of the animal, and to give a portion of these with each feed, as intimately incorporated as might be practicable with the more solid food. With this view I obtained Moody's cutter, now sold by Carson, of Warminster, which cuts the roots into thin ribands; these we turn over amongst the chaff, so that the animals cannot avoid eating them together.

I have for some time directed the attention of some of the agricultural implement-makers to the want of a pulping-machine, in order to effect a still more intimate incorporation of the drier food with the roots, for which a prize has lately been offered by the Royal Agricultural Society. Such an article was produced at Lincoln by Mr. Phillips, of Downham. This is an effective machine at 11 guineas. It cannot probably be rendered, as at present constructed, at a less cost; but while the cost of Moody's cutter is only 4*l.* 10*s.*, a machine for pulping must be produced at much less cost than 11 guineas before it will get into the farmers' hands.

I observed that the animals under the change to which I have adverted throve faster, and were kept equally clean with one-third less litter, by weight, than we had found necessary on the former mode of feeding.

In the month of August, 1853, our Swedes and Mangold were struck with some kind of blight, or other not very well defined malady, which nearly stopped their growth, and we were reduced to the alternatives of selling some of the stock or putting the whole on short allowance of roots, and we adopted the latter. We limited the bullocks to 50 lbs. weight, and the sheep to 10 lbs., per head per diem. We had plenty of good Barley-straw, but the hay was very indifferent, having been exposed for several weeks to rain, and put up at last in questionable condition.

I purchased 17 bullocks at the October Hereford fair. For the first four weeks they had little else than the Barley-straw and bad hay cut into chaff, with their 50 lbs. of roots. From that time till they were sold they had 6 lbs. of Linseed and Rape-cakes, mixed in equal proportions and boiled, and the soup poured over the chaff, which was then covered over in a slate-tank until the former was completely absorbed. This destroyed the fungus or mould which had accumulated on the damp hay, and rendered it perfectly sweet, but of course could not restore the nutriment washed out by the rain. The Linseed and Rape-cake together averaged 8*l.* per ton; the cost of this therefore was 2*s.* 7½*d.* per head per week. The attendance I put at 6*d.* per head per week (a man and a boy, at 18*s.*, managed in all respects 24 bullocks, 24 fatting hogs, and the store pigs); the chaff, 2*s.* 4*d.* per head per week; the roots (estimated at 10*s.* per ton), 1*s.* 8*d.* Say, for the first four weeks the cost was 5*s.* per head per week; and for the next 13 weeks 6*s.* 10*d.*: when the animals were sold. The account stands thus:—

17 bullocks, prime cost		£286 17 6	
Feeding 4 weeks, at 5*s.*	£17 0 0		
„ 13 „ at 6*s.* 10*d.* ...	76 1 0		
		93 1 0	
		£379 18 6	

They were sold for 386*l.* 10*s.* The credit balance of 6*l.* 11*s.* 6*d.* would be absorbed by the engine-power in cutting the chaff; and the manure represents the straw cut for litter. The result, I think, shows that bullocks may be fatted, in a reasonable time, at a less cost, and with a much less quantity of roots than are usually given, by the mode of feeding adopted, without actual loss. I may observe, too, in reference to this particular case, that, though beef during the year 1853 bore a good price, lean stock commanded a much higher proportional price in the market. *Mr. Lawrence, of Cirencester, in the Journal of the English Agricultural Society.*

Home Correspondence.

Sale of young Short-horn Bulls bred by Mr. Longmore, of Rettie, Banffshire.—A public sale of young bulls of the stock of the above gentleman, who has a high local reputation as a breeder of short-horns, took place on the 20th April. The prices realised, as noted below, will show that the hardy farmers of north-eastern Scotland are not disinclined to pay liberal prices for such animals as give promise to be useful in upholding—in this case we may perhaps justly say improving—the quality of the stock raised in that cold but well farmed district. The names given to the animals are no less indicative of the popularity of our warriors among those holding "land and beeves." Not that their relative popularity is quite in unison with the prices realised. There is something in a name; and it did us good to hear the shouts of self-gratulation in which the burly farmer who became owner of "Sir Colin Campbell" announced his acquisition of the northern hero's namesake. We may further remark that the purchasers were, we believe without exception, practical agriculturists, men noted for their caution and sharp look-out for what will pay.

List of Bulls sold.

Name.	Age.	Price.
Cardigan	14 months	50 guineas
Raglan	12 „	71 „
Canrobert	11¾ „	61 „
Sir Colin Campbell	11½ „	51 „
Dundas	11 „	44 „
Napier	9½ „	33 „
Burgoyne	8 „	31 „
Balaklava	6¾ „	20 „

A ninth, "Inkermann," was catalogued for sale, but an accident had occurred to him: from choking on a Turnip, the best breeding will not secure exemption. *S.*

Manures.—It would be a great boon to little people like myself if you or any of your correspondents could give us practical information as to the value of some of the manures which we see advertised in your columns. Several of these might suit our purpose, if we could depend on the genuineness of them. To take one instance—I see the "Patent Nitro-phosphate or Blood Manure" most highly recommended *quoad* trustees, directors, &c. Will any one of these trustees tell us the value of this dung from his own experience, or send a recommendation of it from Professor Way? It might be worth his while; and so on with others. And why will not Messrs. Gibbs sell Peruvian guano in rather smaller quantities, or seal their bags, or do something to enable the small consumers to get an honest manure, instead of encouraging the trade of the "rogues in dirt," as is practically the case now? Is not the money of the little man as good as any other? *S. R. E.*

Straw Chaff as Food for Stock.—In reference to a letter on this subject which appeared in our columns lately, Mr. Phillips has written as follows:—It is true I prefer steam as a means of cooking the chaff, but boiling water is a very good substitute where steam cannot be had, or even cold water will do, only with this latter you must adopt the system of spontaneous fermentation, which has, however, this disadvantage, that the process is longer in hand, and further requires a larger expenditure of the minced roots, which in a season like this is a serious consideration, as it requires about one-third of the bulk to be minced roots in order to set up spontaneous fermentation. But whatever mode you adopt of cooking the chaff, the best receptacles for the purpose will be brick cisterns or tanks, which of course may vary in size, according to the quantity of food required for consumption; a good size for these cisterns is 6 feet square, inside measure, by 3 feet 6 inches in depth, or 6 feet by 9 feet inside; if very large quantities of food are required, they must have a perforated false bottom, either of wood or iron, and there should be a wooden plug through the outer wall, inserted between the true and false bottom, to let out superfluous moisture, or, in case of spontaneous fermentation being adopted, to let in atmospheric air, which is highly essential to its production. The outside walls of the cisterns should be 9 inches in thickness and the partition walls 4½ inches; there should also be an Oak kerb on the top of the walls, and lids to cover down the cisterns securely, so that there may be no unnecessary waste of steam. From two to four cisterns will be sufficient on most farms. I, however, make use of five such, and think of erecting two more. Where there is not a steam-engine upon the farm, one of the ordinary steam generators for cooking vegetables would be found useful, and might be had at a moderate price, with which the cisterns might be heated. In mixing your minced roots with the straw chaff, do it when removing it from the cisterns; the roots do not require steaming; and as to the best mode of preparing the roots for mixing, by mincing or pulping, I am not aware that there is any better machine for the purpose than the Royal Agricultural Society's prize pulping or mincing machine, made by Woods, of Stowmarket, Suffolk; who also makes a larger machine, applicable to steam or other power, which will mince from two to four, or even more bushels, per minute. *Frederick Phillips, The Hall Farm, near Brandon.*

Failure of Wheat after Dressing with Blue Vitriol.—A piece of Wheat of mine has lost stock to such an extent that scarcely a plant can be seen in some parts of the field. I attributed this at first to the frost, but I am now inclined to think that the cause is the dressing of the seed in the usual way with blue vitriol, because a small part sown with undressed seed is as thick and flourishing as I could wish. The seed was sown when the ground was dry, after waiting for rain which did not fall till some time after sowing. Much of the seed never grew, and that which did grow was so weak that it could not resist the frost, and has wellnigh all perished. *J. C. C.*

Diseased Meat.—The prevalence of particular diseases in London cannot be a matter of astonishment to those who are aware of the universal adulteration of food of every description, both liquid and solid—nothing escapes the ingenuity of traders; the only wonder is that the mortality in the metropolis is not greater under the amount of poisonous stuff daily swallowed. It will not be necessary to enumerate the various articles, mixed with red lead, sulphuric acid, copperas, &c., &c., which are daily consumed by the public. However there is one fact which will interest the readers of the *Chronicle*, more particularly respectable agriculturists, who will be shocked to be classed amongst vendors of diseased meat—a trade apparently carried on to an immense extent, which the *Gazette* will do well to expose, and put a stop to a traffic so nefarious. The following extracts from the "Quarterly Review," March, 1855, speak for themselves:—Evidence before the Smithfield Market Commission:—"It is purchased by soup shops, sausage makers, the *à-la-mode* beef and meat-pie shops, &c., &c. There is one soup shop, I believe, doing 500 lbs. a week in diseased meat; this firm has a large foreign trade. The trade in diseased meat is very alarming, as anything in the shape of flesh can be sold at 1*d.* per lb., or 8*d.* per stone. I am certain if 100 cows were lying dead in the neighbourhood of London, I could get them all sold in 24 hours: it don't matter what they died of." Again—"The London market is very extensively supplied with diseased meat from the country. There are three insurance offices in London, in which graziers can insure their beasts from disease. It was the practice of one of these offices to send the unsound animals dying from disease to their own slaughter-houses, situate 160 miles from London, to be dressed and sent to the London market. Cattle, sheep, &c., are insured against all kinds of diseases, and one

of the conditions is, that the diseased animal when dead becomes the property of the insurance company, the party insuring receiving two-thirds of the value of the animal, and one-third of the salvage, or, in other words, one-third of the amount the beast is sold for when dead. The Chinese are supposed to be rather gross feeders, because they consider dogs, &c., delicacies, but a well-fed puppy in a pie must be a luxury when compared to a bit of diseased cow covered with dirty crust and well seasoned. "People who live in glass houses," &c., &c." *Falcon.*

To sow Clover Seed.—I have found the following method of sowing Clover seed so successful in producing a good plant the following spring that I beg to offer it, through your columns, to the consideration of those who have the means of availing themselves of it. I always use Cambridge's presser this month to protect my Barley from the ravages of the wireworm, and in the grooves or furrows made by this implement I sow the Clover seed broadcast, and the bush-harrow which follows brushes the seed into the bottom of the grooves, and covers it over at a uniform depth. This method has for the last three years produced excellent crops of Clover—far better than I had before been able to obtain, either by drilling the seed or sowing it broadcast—and seems to combine the advantages of both these systems. To ensure the seed being evenly sown I usually sow it with the drill, the coulters and the principal part of the pikes being removed. *G. P. S.*

Societies.

ROYAL AGRICULTURAL OF ENGLAND.

Monthly Council, May 2: Mr. Miles, M.P., President, in the Chair.

Finances.—Mr. Raymond Barker, Chairman of the Finance Committee, presented the Monthly Report on the Accounts, from which it appeared that the current cash balance in the hands of the bankers was 3225*l.*

Journal Committee.—The President submitted to the Council the Report of the Journal Committee, containing the following recommendations:—

1. The postponement to a subsequent meeting of the further reports made by the Judges of Essays, in their adjudication of prizes for 1855.
2. The postponement, to a Special Council next week, of the report of the Committee on the prizes for essays, to be offered by the Society for 1856.
3. The election of Dr. Edward Hartstein, Professor of Agriculture in the Royal Academy of Poppelsdorf, as an Honorary Member of the Society.
4. The delivery of Professor Way's Lecture on the Production of Butter, on the 16th of May; and his Lecture on the use of Fish as Manure, on the 13th of June, before the Members in the Council Room of the Society, at 12 o'clock on each of those days.

These recommendations were unanimously adopted by the Council.

Chemical Committee.—Sir John Johnstone presented the report of the Chemical Committee, stating the progress of the researches, undertaken by direction of the committee, and carried on by Professor Way, in his new laboratory, 15, Welbeck Street, Cavendish Square. This report was adopted, and an order made that the amount of the grant for the year ending the 1st May, should be placed at the disposal of the committee.

Carlisle Meeting.—Mr. Fisher Hobbs presented the Report of the General Carlisle Committee, announcing the arrangement of the programme for that occasion, and its preparation for distribution.

Steam-power Conditions.—Mr. Raymond Barker submitted the following recommendations, which were adopted:—

1. *Steam-engine Pumps.*—That no force-pump must be fitted with more than two valves, which must be of easy access. That if two pumps be fitted for the same engine, no more than one be allowed to work at the same time.
2. *Reaping-Machines.*—That the Society find horses for the trial of the reapers, but that exhibitors may, if they think proper, send their own horses for that purpose.

Steward of Implements.—On the motion of Mr. Fisher Hobbs, seconded by Mr. Hamond, Sir Archibald Keppel Macdonald, Bart., was appointed Steward Elect of Implements for the Carlisle Meeting.

Country Meeting of 1856.—The Report of the Inspection Committee having been read, the Council received a deputation from Chelmsford, consisting of the following gentlemen:—Mr. Burch Western (Chairman of the Essex Local Committee), Mr. D. Waddington, M.P., General Hall, Major Skinner, R.A., Mr. Bullock, Mr. Gurdon Rebon, Mr. Kemble, Mr. Mechi, Mr. Hardcastle, Mr. Round, Mr. Parker, Mr. Batard, and Messrs. Meggy and Chancellor (Secretaries to the Committee), who favoured the Council with their explanations of the various local advantages possessed by the town of Chelmsford for the country meeting of the Society. On the motion of Mr. Fisher Hobbs, seconded by Mr. Jonas, Chelmsford was then decided upon as the place of the country meeting of 1856, subject to the completion of the stipulated engagements, and the usual agreement to be entered into by the authorities of the town with the secretary of the Society.

Country Meeting of 1859.—The Council then proceeded to determine the district of the country meeting four years in advance; and Mr. Wren Hoskyns having alluded to the great increase of transit accommodation, furnished by the gradual completion of the railway system of the country, especially in the county of Warwick, and the other central counties of England, since the Society held its country meeting at Oxford in 1839, it was carried, on the motion of Mr. Fisher Hobbs, seconded by Mr. Thompson, that the Country Meeting District for 1859 should comprise the counties of Oxford, Warwick, Northampton, and Berks, and be denominated the "Central District."

Soda.—An important communication was received from Lord Wodehouse, on the part of the Earl of Clarendon, in reference to an abundant supply of native carbonate of soda ascertained to exist in South America; and of which specimens, forwarded from the Foreign Office, had been placed in the hands of Prof. Way for analysis.

Adjourned to May 9.

Farmers' Clubs.

Botley.—*On Agricultural Leases.*—At a late meeting of this Club this subject was again discussed. Judge Gale said—I desired to bring before a body of practical men interested in land, as landowners, as well as tenant-farmers, the question whether a scheme might not be devised by which, while the interests of the landlord should be secured, the tenant might be freed from the restrictions by which he is at present bound. He is frequently, indeed generally, restricted from the sale of root crops and all straw. Now he could, particularly in the neighbourhood of large towns, often sell the former for milch cows for much more than they are worth for feeding purposes; and it frequently happens that he could sell his excess of straw for 40*s.* or 50*s.* a ton, which he is able to convert only into manure, very inferior in value to that which he might purchase with the price of his roots and straw.

Judging from observations made in the *Mark Lane Express*, many farmers prefer a good tenant-right agreement to a long lease. I cannot, however, think that preference is by any means general. It is true by the effect of such an agreement a farmer might be reimbursed for any outlay of improvement in the event of his being ejected from his farm; but I should call that but a poor compensation. In no trade can a man change his locality without a heavy loss, and that is particularly true of farmers. Every farmer must know the reason why. Besides which, if times are good, as I hope they will continue to be, it is not an easy thing for a farmer to find a farm to suit him. A shop-keeper, or a manufacturer, has obviously much greater facilities of locomotion. Farmers, too, are more likely to have strong local attachments, and if there were no pecuniary loss in moving from among his friends and connections, it would be with a great sacrifice of comfort that he would begin the struggle of life again surrounded only by strangers. However, those who prefer a good tenant-right agreement will, of course, get it if they can; but I repeat, that in my opinion, a farmer possessed of capital, which he desires to lay out on the land, would prefer a long lease to any other security. A friend of mine, Mr. John Bullar, a conveyancer in extensive practice in town, has informed me that there are, in the Lothians, leases, known as Lord Kaimes' leases. They are for a very long term—I think 999 years—determinable at septennial periods, by the tenant only, by a seven years' notice. Every seven years the rent is increased. I presume there is a sufficient provision for the landlord's protection. Whatever may be the advantage of such leases, I think it very unlikely that demises for so long a term would be adopted in England. Few landlords would like so completely to part with their interest in, and control over, their land. In the Lothians agriculture is very much assimilated to the manufacturing procedure. On all the farms of any size there is a steam-engine—of course, with its invariable long chimney; and on a great many gas is made, by the light of which the labourers work in the long winter evenings. I should imagine that such a country must have almost lost its rural appearance. Whether we shall ever arrive at such business-like proceedings it is difficult to say; if we ever do, though the land may gain in productiveness, it will lose in the picturesque.

Mr. Wyatt referred to the system of Nottingham, where the custom was that the outgoing tenant was to be paid for what he left, and then he left the farm in such a state that his successor could cultivate it with the best advantage. In that county they had handed the system down from father to son. Mr. Wyatt then read the communication to which he had before referred, sent to him by a friend in answer to his inquiries. The letter was dated from the vicinity of Nottingham, and was as follows:—

"I have been desired by Mr. Potts, of Calverton, to acquaint you with our system of valuing tenant-right in this neighbourhood. In the first place, we pay for all labour done on Turnip land or summer fallows, together with the average rent and rates of the farm, Turnip seed, and hoeing, and for all purchased manures and carriage, and for the labour of manure being the produce of the farm, deducting therefrom one-half the value of the Turnip crop when consumed on the land by sheep, and the whole when drawn off to the yards or consumed by cattle provided the manure belongs to the tenant, but if it belong to the landlord only one-half is deducted, whether it is consumed on the land or in the yards. The allowance for bones is for three crops of corn or Grass in sixths; after a crop of Turnips we allow the whole cost and carriage; after one crop of corn or Grass mown 2-6ths is deducted without carriage; after one crop of corn or Grass mown and one year's pasture half; and after one crop of corn and two years' pasture 4-6ths; and after two crops of corn or Grass mown and one year's pasture 3-4ths, after which the allowance ceases. For lime we allow for two crops the whole value and labour before a crop, and half the value after one crop; this I think too little and should like to increase it. For all artificial manures, such as guano, Rape-dust, superphosphate of lime, &c., one-third without carriage after one crop of corn or Grass mown. For draining, tiles, labour, and carriage, or any part of them for seven years, deducting one-seventh every year. For Linseed cake, one-fourth of the bill for the last two years, and in some cases one-quarter and 1-6th. We have nearly done away with the system of fallowing or way-going crops, substituting in its place the above-mentioned tenant-right. I recommend the manure should invariably belong to the tenant, because it is much better taken care of, and we value to the tenant on quitting the whole of the manure which is made from the last year's produce, together with all the hay and straw unconsumed, and if it is greatly in excess, at a less rate. We also value any hay or fodder of previous years' growth, deducting the value of manure it would be supposed to make. All fixtures which belong to the tenant and have had the sanction of the landlord, must also be valued. All labour in the preparation of the land for seed Wheat or other corn, with the bill for Clover seed and sowing, and all corn sown."

Mr. Blundell said, with regard to the statements made in the communication read by Mr. Wyatt, let them not be misled by the system of Nottinghamshire. What were they met to consider? A proposition was made by Mr. Gale, to provide a remedy for the landlord for what was being done wrong by the tenant; and a compensation to the tenant for the unexhausted manures he left on the land. These were powers that had not been possessed by them before. He did not object to them. If they were beneficial to the tenant they were so also to the landlord. What had been suggested by his friend Mr. Wyatt differed from the practice of this part of the country, but he should not enter into the details of the system described by him, except as to the new position in which they found themselves. Before entering on it he would say that no one would object to tenant-right agreements, yet he thought that the law would never compel parties to submit to one general rule, and he hoped they would all stand upon their own foundation. Let the rates of compensation be law when they have been agreed to by both parties. With respect to the observations of Mr. Gale as to the landlord's obtaining immediate possession of the land—for breach of covenant—to be settled in the county court, he would say that the landlord would have a superior power over his tenant. If that summary power were to exist, the object would, as he took it, be to prevent the tenant doing the injury. He thought that an essential alteration in the lease must be made before this summary power was given to the landlord. He had therefore made a bold hazard, and had proposed a form of, or rather conditions for, a lease, and a scale of payments to be made to the tenant when he leaves, all depending on the supposition that what Mr. Gale proposes shall have been made law—else they might come before the world, asking for power for the landlord over the tenant, without protecting the tenant in his just demands against the landlord. Let them meet on such terms that the public cannot say, "You don't act upon fair principles by having your settlement in a county court."

Proposal for Farm Lease under a New Arrangement, whereby the Landlord should obtain immediate possession by arbitration:—

Lease for Seven, Fourteen, or Twenty-one years, determinable by either party giving two years' notice (in writing) previous to the expiration of either of the before-named periods.

Upon entry, the landlord and tenant both to be represented by their agents, or valuers, who shall inspect the farm, and agree upon the general state thereof between themselves, or by umpirage, and sign a written statement of the condition, &c. of each field, or parcel of land, and also of the state of the farm-buildings, &c. as to repairs.

The tenant to be allowed to cultivate the land, as regards rotation of cropping, &c. as he may deem most advantageous during the whole term, except in the last two years of the lease, whether determined by notice or otherwise, during which two seasons the land shall be managed and cropped according to the four course rotation, or Norfolk, system of cropping, viz.—one-fourth part to be fallowed and seeded for roots, &c. to be fed on the farm: one-fourth to be sown with Barley or Oats; one-fourth to be seeded to Clover and Grass; and the remaining fourth part to be sown with Wheat.

The tenant to be allowed to sell hay and straw, except during the last two years of the term; and, on leaving, to be paid by the landlord for haulm and fodder at consuming price, and for hay at market value, or at consuming price, upon the same principle at the same ratio as the tenant paid upon entry.

Repairs to be done by the tenant, the landlord finding the materials.

The tenant, upon leaving, to be paid for seed and tillages, and purchased manures, from which he has derived no benefit, at the full value.

The tenant to receive from the landlord the value of unexhausted manures and improvements at quitting, according to the rates named in the annexed schedule:—

Rule 1. Purchased manure, either town, yard, or other decomposed manures, to be charged over two years: first year, 20*s.* in the pound; second, 6*s.*

2. Bone manures used for Turnips, &c., to be charged over two years: first year, 20*s.* in the pound; second, 8*s.*

3. Superphosphate of lime, guano, &c., used for Turnips, &c. to be charged over two years: first year, 20*s.* in the pound; second, 6*s.*

4. Grain, Pulse, Linseed, or oilcake, fed during the last year of the tenancy, by fatting stock or sheep, to be charged at 8*s.* in the pound.

5. Lime, if used by itself or with common mould, to be charged over two years: first year, 20*s.* in the pound; second, 10*s.*

6. Chalk, if done by consent of the landlord, the quantity and price per acre to be first agreed by landlord and tenant, to be charged over five years: first and second years, 20*s.* in the pound; third, 15*s.*; fourth, 10*s.*; fifth, 5*s.*

7. Draining (where the landlord finds tiles, the tenant doing the labour), to be charged over six years: first year, 20*s.* in the pound; second, 18*s.*; third, 16*s.*; fourth, 14*s.*; fifth, 10*s.*; sixth, 5*s.*

8. Pipe or tile draining, done by consent between landlord and tenant, tenant finding everything, to be charged over ten years: first year, 20*s.* in the pound; second, 18*s.*; third, 16*s.*; fourth, 14*s.*; fifth, 12*s.*; sixth, 10*s.*; seventh, 8*s.*; eighth, 6*s.*; ninth, 4*s.*; tenth, 2*s.*

9. Any hedge planted, pasture-land converted into tillage, orchards or plantations made by the consent of landlord, to be subject to valuation.

10. Extra buildings required to be subject to a special agreement between landlord and tenant.

11. Temporary buildings.—Any shed put up for sheep, cattle, manure, &c., by the tenant, to be taken by the landlord at valuation, or be allowed to remove it.

12. All consents to be given in writing.

13. If any dispute arise between landlord and tenant respecting any of the abovementioned rules contained in this schedule, to be subject to reference, one referee to be chosen by each party, who are to choose an umpire before proceeding to business, whose decision shall be final.

After a lengthened conversational discussion, Mr. Spooner said their subject was the consideration of agricultural leases, but they had diverged into many others. The object is to have such regulations laid down as conditions of the lease as should be satisfactory to the landlord and the tenant, and beneficial to the country at large, the aim being that the cultivation shall be as good in the last as in the first year of the tenancy. The subject at the last meeting had two objects, first, a recommendation of an Act of Parliament; and second, a recommendation to make an agreement between landlord and tenant. The first was to enable the landlord to get rid of a bad tenant who wanted to get all he could out of the land, and then leave it in its impoverished condition; or that was unable from poverty to do justice to himself or his landlord. Judge Gale seemed to consider it was not desirable the landlord should have the power, for some weak and frivolous reason perhaps, to dispossess the tenant, but that upon

his desiring to do so (to save his land from further deterioration), to leave the power to some valuers, who are to look upon the land, and if they find it as represented, they should have the power to dispossess the tenant from the farm. On the other side, if it could be shown that the land was not injured, or that it would be recovered from its temporary injury, that then they should not be able to dismiss the tenant. Then he understood that the tenant should be paid for unexhausted improvements. It did seem, at first sight, hard, that if power should be given to one party to do himself justice, that it should not be given to the other. The Chairman, after some further disquisition, read the resolutions of the Club as prepared by the Secretary, as follows:—

1st. That it is the opinion of this Club that the numerous restrictions which at present so frequently encumber the leases of farms are absurd and injurious, and should therefore be abolished.

2d. That the tenant should have the power of farming in any manner he may think proper, provided he farms the land during the last two years in such manner as may be specified, and

3d. That he should be compensated for unexhausted manures and improvements, according to a scale laid down and agreed upon.

4th. That the landlord should have the power of dispossessing a tenant for bad cultivation by a more summary process than at present exists, such power to be afforded by an Act of Parliament, and to be exercised only under the sanction of competent valuers, such having been previously agreed to by both landlord and tenant.

5th That in the opinion of this Club the best term for a lease would be 21 years, determinable at the end of 14 years by a two-years notice, given by either landlord or tenant.

Miscellaneous.

The late Mr. Bolden's Herd.—On Friday, April 27th, the sale of the celebrated stock of short-horned cattle, the property of the late John Bolden, Esq., of Hyning, took place at Springfield Hall, Lancaster. There was a remarkably good attendance from all parts of the country, and we noticed the presence of some visitors from Ireland. Mr. Strafford officiated; and the competition was remarkably spirited, as the following prices will show:—

Calendar of Operations.

MAY.

Cambridge, May 2.—The month of May has arrived, but not with it any Grass, and dairy stocks generally are suffering for want of it. Hay last year was an exceedingly light crop, and many farmers have had to buy hay and other food at a high price for their cattle, and are now, from necessity, turning them out to very bare pastures. Wheat is recovering rapidly from the effects of the severe weather, and where the root has not been too much thinned is very promising for a crop. The sowing of spring corn of all descriptions, and of seeds, has been quickly got over in consequence of the frost having left the ground in beautiful order for their reception. Potato planting has been satisfactorily performed, and the sowing of Mangold Wurzel, which is now so important a crop, is in a forward state. The next step is the preparation for the Turnip crop, but farmers generally are not so anxious as formerly to sow early on account of the increased liability of mildew to early sown Turnips; from the last week in May to the end of the first week in June is now considered the best time on an average of seasons. Vetches and all kinds of spring food for soiling cattle will be much later than usual, consequently the expense of keeping stock will be greatly enhanced. Owing to the very dry summer of last year, and the great scarcity of Grass, the make of cheese was unusually small, and there is now very little in the farmers' hands, consequently prices have ranged rather high at the late fairs; but considering the deficiency, they are not remunerative. Oats are very scarce and dear, and Wheat is rather more in demand at higher prices. *W. P.*

Notices to Correspondents.

Clover: *A Ten Years' Subscriber.* 3 cwt. of Lawes' superphosphate per acre would be a good dressing for old Grass land. It should have been spread early in spring. If you mix the guano you purpose sowing with 10 or 12 times its bulk of garden mould, or good earth of any kind, for a day or two before sowing, and then spread it over the Clover in or after the first rain, you will do good "without any mixture of harm."

Grass: *G S.* Sow ½ cwt. of nitrate of soda, and 1½ cwt. of guano, mixed up with two or three times its bulk of good mould broadcast per acre.

Marl: *J P.* Put it into a wine-glass half full of vinegar. If it effervesces you may conclude it to be a marl. It appears to effervesce very slightly indeed; but may be a useful dressing upon very light land.

Poppy-cake: *W O M* having seen lately in our columns a favourable analysis of Poppy-cake as food for young stock, asks if any of our readers can speak of its feeding qualities from actual experience, and also where it can be procured.

The bulls marked * were bred by Mr. S. E. Bolden.

RICHMOND & CHANDLER'S PATENT CHAFF CUTTING MACHINE.

All the various modern Implements of Agriculture manufactured on the most scientific and improved principles, suitable for home use and exportation.—Address, RICHMOND & CHANDLER, Salford, Manchester; and 32, South John Street, Liverpool.

☞ CATALOGUES GRATIS.

WILLIAM DRAY AND CO.'S STEEL DIGGING FORKS are warranted equal, and by many are considered superior, to any in use. Three Tine Forks, 4s. 6d. each; Four Tine Forks, 5s. 6d. each. A liberal allowance on Wholesale Orders. WILLIAM DRAY & Co., Swan Lane, Upper Thames Street, near London Bridge.

PARKES' STEEL DIGGING FORKS & DRAINING TOOLS.

MESSRS. BURGESS AND KEY, as Mr. PARKES' Wholesale Agents for England, have always in stock a large assortment. These Forks and Tools are now in use by upwards of 1000 of the Nobility and Farmers, members of the Royal Agricultural Society, who pronounce them to be the best ever invented, and to facilitate labour at least 20 per cent. Price Lists sent free on application, and Illustrated Catalogue of the best Farm Implements, on receipt of eight postage stamps.

WARNER'S IMPROVED LIQUID MANURE, OR GENERAL PORTABLE PUMP.

The valve is a ball of imperishable material, and cannot clog in action. The barrel is of galvanised iron, not likely to corrode, and can be raised or lowered at pleasure. The legs will fold together, and the whole may be carried on shoulder to any pond or tank required.

Price of 4½ in. Pump, with legs, 3l. 3s. The barrel is 27½ in. long, and the legs are 5 ft. high.

1½ inch Gutta Percha Suction Pipe, 1s. 6d. per foot.

1½ inch Flexible Rubber and Canvas Suction Pipe, 3s. 6d. per foot.

May be obtained of any Ironmonger or Plumber in town or country, at the above prices, or of the Patentees and Manufacturers, JOHN WARNER & SONS, 8, Crescent, Jewin Street, London.

Every description of Machinery for Raising Water, by means of Wheels, Rams, Deep Well Pumps, &c.; also Fire and Garden Engines, &c.—Engravings sent on application.

WARNER'S PATENT VIBRATING STANDARD PUMPS.

PATENT CAST-IRON PUMPS, for the use of Farms, Cottages, Manure Tanks, and Wells of a depth not exceeding 30 feet.

The short barrel Pump is very convenient for fixing in situations of limited height and space, for the supply of coppers and sinks in Wash-houses with soft water from underground tanks, or in Hot, Forcing, and Plant Houses; they may be fixed, when desired, under the stage.

May be obtained of any Ironmonger or Plumber in Town or Country, at the above prices, or of the Patentees and Manufacturers, JOHN WARNER AND SONS, 8, Crescent, Jewin Street, London.

Every description of Machinery for Raising Water, by means of Wheels, Rams, Deep Well Pumps, &c.; also Fire and Garden Engines, &c. &c.—Engravings sent on application.

JOHN WARNER AND SONS, Crescent, Jewin Street, London. GALVANISED IRON TUB GARDEN ENGINE, WITH WARNER'S REGISTERED SPREADER,

is strongly recommended, for durability and low price, viz., 2l. 19s., to hold 10 gallons.

Larger sizes in wood or iron, viz., 14 gals., 24 gals., & 35 gals. May be obtained of any Ironmonger or Plumber in town or country, or of the Patentees and Manufacturers, as also Machinery of all kinds for raising Water from any depth to any height by Steam, Horse, or Manual Power. Prices sent on application. Syringes of various constructions and sizes from 9s. upwards. Metallic String from 5d. to 1s. 3d. per lb.

JOHN WARNER AND SONS, 8, Jewin Crescent, London, Manufacturers of FIRE ENGINES, PUMPS, GARDEN ENGINES, and SYRINGES.

Brass Syringes, 9s. to 18s.

All articles of JOHN WARNER & SONS' manufacture may be obtained of any Ironmonger or Plumber in town or country, at the advertised prices.

JOHN WARNER & SONS having been practical Horticulturists for many years, know exactly the requirements of both Amateurs and Gardeners. A gardener with a properly constructed pump will get through as much work in five minutes as he could with any Syringe in a quarter of an hour, and with half the labour to himself. Syringes are economical for small houses.

No establishment offers such a variety of effective machines for hydraulic purposes, whether to supply Gardens, Hothouses, Cottages, Farms, Mansions, or Boards of Health, with every requisite connected with the conveyance and distribution of liquids.

Fountains suitable for Conservatories, Lawns, &c.

Sheets of Engravings sent on application.

LINGHAM BROTHERS, No. 170, Hampton Street, Birmingham, sole Manufacturers of the improved WOOD and ZINC MONOGRAPH, or LABELS for Garden Borders, Flower-pots, &c., in boxes of 100 each. The Zinc Labels are highly approved of for their lasting durability, can be written upon with the greatest ease, and when dry a permanent inscription is secured. Directions are sent with each box, including a bottle of metallic ink.—Sole Agents in London, Messrs. DRAKE DRAY & Co., Horticultural Implement Warehouse, 46, King William Street, London Bridge.

HORTICULTURE IN ALL ITS BRANCHES.

JOHN WEEKS & Co., King's Road, Chelsea,

HOTHOUSE BUILDERS.

THE NOBILITY AND GENTRY about to erect Horticultural Buildings, or fix Hot-water Apparatus, will find at our Horticultural Establishment and Hothouse Works, King's Road, Chelsea, an extensive variety of Hothouses, Greenhouses, Conservatories, Pits, &c., erected, and in full operation, combining all modern improvements, so that a lady or gentleman can select the description of House best adapted for every required purpose.

The HOT-WATER APPARATUS, which passes through all the Houses and Pits, affording both top and bottom heat, is in constant operation and particularly worthy of attention.

Many of the Houses and Pits are of wide and lofty dimensions, and together equal in length 1000 feet. They are all effectually heated by *one boiler*, which, during the severe winter months does not cost in labour and fuel more than 3*s.* 8*d.* per day, and the apparatus is so arranged that each House or Pit may be heated separately and to the required temperature. The splendid collections of Stove and Greenhouse Plants are also in the highest state of cultivation, and for sale at very low prices. Also a fine collection of strong Grape Vines in pots, from eyes, all the best sorts.

Plans, Models, and Estimates of Horticultural Buildings; also Catalogues of Plants, Vines, Seeds, &c., forwarded on application to JOHN WEEKS & Co., King's Road, Chelsea, London.

WARD'S CASES, GAS BOILER, Double Action Galvanised PUMP, with Gun-metal Buckets and Pulpit Branches for sale.—Apply to H. SMITH, 12, Rufford's Row, Islington, London.

COTTAM AND HALLEN have on Show, at their Repository, No. 2, Winsley Street, Oxford Street, London, a great variety of the following articles for the Garden, &c., at very low prices, viz.:—Garden Rollers, Cast-Iron Rickstands, Garden Engines, Mowing Machines, Garden Chairs, Superior Garden Tools of all kinds, Garden Vases and Pedestals in great variety, and a large assortment of Horticultural and Agricultural Implements.

Ornamental Wire Flower Stands, Pot Trainers, Rose Tree Guards, Flower Bordering, and every description of Wire Work, both plain and ornamental.

Hand Glass Frames, Cast and Wrought Iron Flower Stakes, Garden Arches, &c.

Strong Iron Hurdles, and best Wire for Strained Wire Fencing.

Hothouses, Conservatories, &c., made upon the most improved principle, either of Iron, or of Iron and Wood combined, which can be fixed complete, with Hot Water Apparatus, in any part of the Kingdom.

Show Rooms at the Manufactory, 2, Winsley Street, Oxford Street, opposite the Pantheon, where every information may be obtained.

FOR WATERING GARDENS.

HANCOCK'S IMPROVED VULCANISED INDIA-RUBBER HOSE AND TUBING is now manufactured especially for the above purpose; is of greater flexibility than any other description of Hose; is capable of resisting great pressure, and made suitable for attaching to the mains of water-works, or to tanks of high elevations.

WATERING HOSE fitted up with the necessary *brass joints, stop-cocks, branches,* and *spreaders complete.*

VULCANISED INDIA-RUBBER SUCTION PIPES, made any length or size for Pumps or Garden Engines.

VULCANISED RUBBER WASHERS, and also in Sheet, any thickness, for all kinds of steam and water joints, or made any size or figure to order.

All communications and orders punctually attended to, addressed to the Manufactory, JAS. LYNE HANCOCK, Goswell Road, London.

THE IMPROVED PATENT GARDEN, WATER, AND ROLLING ENGINE may be seen in the Agricultural Department at the CRYSTAL PALACE, SYDENHAM.

The threefold use of this neat little Machine must be obvious in Watering, Rolling, or Syringing; it will throw about 60 feet, and is so portable that any ordinary domestic may use it. It contains about 20 gallons. Price 5*l.* 10*s.*

May be had at J. DORE's Manufactory, 17, Exmouth Street, Clerkenwell, London.

BEEHIVES.

NEIGHBOUR'S IMPROVED COTTAGE BEEHIVE, as originally introduced by GEORGE NEIGHBOUR & SONS, with all the recent improvements, glasses, thermometer, &c., price 35*s.*, securely packed for the country.

This unique hive has met with universal commendation, and may be worked with safety, humanity, and profit, by the most timid; its arrangements are so perfect, that the honey may be taken at any time of the gathering season without at all injuring the bees.

Early applications, addressed to GEO. NEIGHBOUR & SONS, 127, High Holborn, or 149, Regent Street, London, will receive prompt attention. Their newly arranged Catalogue of other improved Beehives, with Drawings and Prices, sent on receipt of two stamps.

Agents:—Manchester, HALL & WILSON, 50, King Street; Liverpool, JAMES CUTHBERT, 12, Clayton Square; Chester, F. & A. DICKSON & SONS, 106, Eastgate Street; Glasgow, AUSTEN & M'ASLAN, 186, Trongate Street; Dublin, J. EDMUNDSON & Co., 61, Dame Street.

THE CRYSTAL PALACE FLOWER BASKETS made to the original, and a variety of new and elegant Designs for Conservatory, Verandah, Drawing-room, &c., from 3*s.* 6*d.* upwards, by W. RICHARDS, WIRE-WORKER, &c., 370, Oxford Street, nearly opposite the Princess's Theatre. Conservatories fitted up, Aviaries, Bird-cages, Flower Stands, and every description of Wire work. Game and Garden Fencing of the best description.

N.B. Holland, Venetian, Wire, and all kinds of Sun shades, and Window Blinds of best quality.

TREE TRANSPLANTING BY M'GLASHEN'S PATENT.

MR. M'GLASHEN is now prepared to supply Apparatus or give Estimates as to the rate at which he will safely and expeditiously transplant Trees or Shrubs of any dimensions in any part of the United Kingdom.

Canonmills Bridge, Edinburgh.

(Fig. 1.) (Fig. 2.)

J. TYLOR AND SON'S BARROW GARDEN ENGINE (Fig. 1), in best well painted oak tub, fitted with improved Pump, universal joint, and registered Spreader, which answers the purpose of the separate rose fan and jet.

No. 14	" 30	"	" 45	"		...	5 18

A large assortment of every description of Garden Syringes, Pail Engines, Conservatory Pumps, &c., kept in Stock.

No. 1, Plain Syringe, with rose and jet, diameter of barrel, 1½ inch, 14*s.* 3*d.*; No. 2, do., diameter of barrel, 1⅜ inch, 12*s.*; No. 3, do., diameter of barrel, 1⅜ inch, 10*s.* 6*d.*

READ'S SYRINGE, with two roses and one jet, 19*s.*

J. TYLOR & SON'S Horticultural Apparatus may be obtained at these prices from any respectable Ironmonger or Seedsman in town or country, through whom alone they will be supplied, and of whom Drawings and Prices may be had.

N.B. Cost of carriage, &c., not included in these prices.

J. TYLOR & SON'S Manufactory, Warwick Lane, Newgate Street, London.

J. TYLOR AND SON'S REGISTERED GARDEN SYRINGE.—Small size, for Amateur use, **21s.** each; Large size, for Gardeners' use, **25s.** each.

Extra for Telescope Tube as shown in engraving for watering plants on stands at a height of 8 feet, so that any quantity of water can be deposited in the pot without wetting the leaves, &c.

By a simple arrangement this Syringe is rendered more effective than any portable Conservatory or Garden Pump ever offered to the public. It is equally adapted for Garden or Conservatory use, and is capable of discharging twice as much water in a given time as any other Syringe now in use. The arrangement consists in attaching a small flexible suction tube to the barrel of the Syringe, through which it is filled with water at every discharge of the previous contents. By this means the Syringe is always charged, and the pull-up stroke of the piston rendered perfectly easy, it having, indeed, no work to do, the barrel being previously full of water. Being thus made self-supplying, a great saving of labour is effected: and the necessity of stooping to fill the syringe at every discharge being done away with, the direction of the water can be maintained for any length of time. It is perfectly cleanly in its action, as it is not possible for any water to get on the outside of the barrel, which is a well-known inconvenience attendant on the use of every other Syringe. Its construction is perfectly simple, and cannot get out of order; the ground in ball valves and fittings used for filling all other patent Syringes being entirely superseded. To be had of any respectable Ironmonger or Seedsman in town or country.

J. TYLOR & SONS, Manufacturers of Horticultural Apparatus, Warwick Lane, Newgate Street, London.

N.B. These prices do not include carriage, package, or expenses of delivery in the country.

"FRIGI DOMO."—Patronised by her Majesty the Queen, the Duke of Northumberland for Syon House, His Grace the Duke of Devonshire for Chiswick Gardens, Professor Lindley for the Horticultural Society, Sir Joseph Paxton for the Crystal Palace, Royal Zoological Society, Mrs. Lawrence, of Ealing Park, and — Collier, Esq., of Dartford.

PROTECTION FROM MORNING FROST.

"FRIGI DOMO," a Canvas made of patent prepared Hair and Wool, a perfect non-conductor of Heat and Cold, keeping, wherever it is applied, a fixed temperature. It is adapted for all horticultural and floricultural purposes, for preserving Fruits and Flowers from the scorching rays of the sun, from wind, from attacks of insects and from morning frosts. To be had in any required length, 2 yards wide, at 1*s.* 6*d.* per yard run, of ETSEBA THOMAS ARCHER, whole and sole manufacturer, 7, Trinity Lane, Cannon Street, City, and the Royal Mills, Wandsworth, Surrey, and of all Nurserymen and Seedsmen throughout the kingdom.

"It is much cheaper than mats as a covering."

GLASS MILK PANS.

JAMES PHILLIPS AND CO., HORTICULTURAL GLASS MERCHANTS, 116, Bishopsgate Street Without, respectfully beg to direct attention to the price of Glass Milk Pans, the same size as those of German manufacture (17 inches in diameter) but superior in colour, make, and quality.—Packed in cases containing 12 at 12s. per dozen. Case 2s. extra, returnable at full price.

Extract from *Gardeners' Chronicle*.

"All I know about glass milk-pans is this:—When I first took to dairying on a large scale I laid out 20*l.* in glass pans, because they looked so well in a dairy. On further acquaintance with them, I have come to the conclusion that they are the cheapest things (even at 4s. each) that a farmer can use; for they are washed, and wiped, and are kept clean with 300 per cent less trouble than 'leads.'"

BY ROYAL LETTERS PATENT.

THE COSMOPOLITAN GLASS COMPANY.—The Managers beg to inform the Nobility and Gentry, Farmers, Gardeners, &c., that their new List of Prices may be had free on application at the Company's Depôt, 296, Oxford Street, London.

Pipes, since the removal of the excise duty, reduced one-half.

List of Prices and Estimates forwarded on application to JAMES HETLEY & Co., 35, Soho Square, London.

TRELOAR'S COCOA-NUT FIBRE MANUFACTURES, consisting of MATTING, MATS, MATTRESSES, BRUSHES, NETTING, HORSE-HAIR, and BRISTLE SUBSTITUTE, are distinguished for superiority and excellency of workmanship, combined with moderate prices. Prize Medal both in England and America at the Exhibition of all Nations.

T. TRELOAR, Cocoa-nut Fibre Manufacturer, 42, Ludgate Hill, London.

TO NERVOUS SUFFERERS.

A RETIRED CLERGYMAN having been restored to health in a few days, after many years of great nervous suffering, is anxious to communicate to others the means of cure; he will therefore send (free), on receiving a stamped envelope, properly addressed, a copy of the prescription used.—Direct Rev. E. DOUGLASS, 18, Holland Street, Brixton, London.

TO NURSERYMEN AND GARDENERS.

REIGATE SILVER SAND, 12*s.* per ton, 1*s.* 6*d.* per bushel, or 16*s.* per ton, delivered to any of the London Wharfs or Railways, or within a circuit of five miles. Peat and Loam of various qualities. Sacks 2*s.* each.

KENNARD BROTHERS, Swan Place, Old Kent Road.

LINCOLN CEMETERY.

TO ARCHITECTS, SURVEYORS, LANDSCAPE GARDENERS, AND OTHERS.

THE BURIAL BOARD offer the following PREMIUMS, namely:—

For the best Set of PLANS for an Episcopal Chapel and a Dissenters' Chapel, in separate and distinct buildings; a Lodge, with a Waiting Room attached; a House for the Reception of the Dead; and Boundary Fences; accompanied by Estimates, 10*l.*

For the second best ditto, 5*l.*

For the best Plan and Estimate for Laying out and Ornamenting the Ground, 10*l.*

For the second best ditto, 5*l.*

In awarding the Premiums economy of construction in some measure will be taken into consideration.

The Site of the New Burial Ground is part of the South Common, on the East side of and adjoining the Turnpike Road leading to Canwik. The Land must be enclosed to the extent of 15 acres in a geometrical, ornamental, and tasteful manner; the Southern boundary to be the diversion of the Turnpike Road leading to Washingboro', next to Canwick Lordship, but the exact line of such road, as well as the other boundaries and fences, will be left to the taste of the competitor; the Northern boundary not to extend beyond the trial hole.

Parties may compete both for the buildings and laying out of the ground, in one or more plans, &c., and it will be competent for one competitor to take both premiums.

The plans, &c., must be distinguished by a mark or motto, and delivered or sent post paid in sealed covers, with a sealed letter, containing a corresponding mark or motto, with the name of the competitor, to the Clerks of the Burial Board, on or before the 5th day of June next. If any name is written on the plans, or any written or verbal communication made, directly or indirectly, to indicate the competitor's name to any member of the board, or the officials, previous to the plans being selected, such plans will be absolutely rejected.

The Burial Board reserves the right to adopt the plans approved either wholly or in part, and to employ the party whose plans are selected to superintend the carrying out such plans or not, as it may think fit; and whether such party shall be employed or not, the plans for which the first premiums shall be awarded are to become the property of the Board.

It is expressly stipulated that the payment of the premiums shall be withheld until the plans selected shall have been carried out, and the works found to be executed at the estimated costs or thereabouts.

The party whose plans are selected must, if required, be prepared to complete and deliver the working drawings and specifications for the inspection of persons willing to tender for carrying out and executing the same, within 14 days after receiving the order for the same.

In case none of the plans should be found to have sufficient merit to justify an award, the Burial Board reserves the right to withhold the premiums.

A Plan of the South Common may be seen, and a tracing taken, and further information obtained, at our Offices.

Lincoln, May 1. WM. ANDREW, THURSTAN G. DALE, } Clerks to the Burial Board.

FARM WANTED TO HIRE.—The Advertiser is in want of a FARM of from 20 to 50 acres of good Arable and Pasture Land, with respectable residence, and ample outbuildings, within a distance of 20 miles from London. Possession to be taken either at once, or at Michaelmas next.—Apply, stating rent and other particulars, to Y. Z., care of Mr. Macaulay, Stationer, Rochester, Kent.

BINFIELD ROAD, STOCKWELL, SURREY.

TO BE LET on Lease, the whole or part of a desirable NURSERY GARDEN, walled round, Cottage containing five convenient rooms on the ground floor, three Greenhouses, and two Sheds.—Particulars of Mr. THOMPSON, 3, Finsbury Chambers, Blomfield Street, London.

CONNEMARA, IRELAND.

TO BE LET, for a term of years and entered upon immediately, the FARM OF SHANBOOLARD, in the parish of Ballinakill and county of Galway. It consists of about 264 statute acres of Arable, Pasture, and Bog Land, on which a considerable sum has already been spent in permanent improvements. The Farm would be let at a Corn Rent, and, if required, on a long Lease—the rent in proportion. The Farm is bounded on the north by Ballinakill Harbour, affording good sea-bathing; and on the south by Ballinakill Lough, noted for its Brown Trout, and commands extensive views of the Achill and Connemara Mountains. It is within eight English miles of the market-town of Clifden.—For particulars apply to Mr. EDWARD WHITWELL, Letterfrack, Galway.

HIGHLANDS OF PERTHSHIRE.

TO BE LET, CASTLE MENZIES and SHOOTINGS; the House, as furnished, affording ample accommodation for a numerous family and establishment, along with 10,000 acres of Muir and Low Ground Shootings. The stock of Game, which has been strictly protected and well preserved, will be found good, healthy, and of all the usual descriptions; and Salmon Fishing is to be had along the banks of the Tay and Lyon, which bound the property for six miles. The post passes the gate, and from Aberfeldy (two miles distant) coaches proceed in all directions. Supplies are easily procured. The climate is exceedingly good; and the place would be equally suitable as a permanent residence or as a shooting quarter.—Apply to ARCHIBALD CAMPBELL, Camserney Cottage, by Aberfeldy.

HOUSE AND SHOOTING.—ISLAND OF MULL.

TO BE LET, CARSAIG HOUSE, beautifully situated on the South Coast of Mull. It contains three public rooms, seven bed-rooms, three dressing-closets, and a bath, ample accommodation for servants, and is well supplied with water. The tenant may have accommodation for two or three horses, and may have a pasture for two cows, or be supplied with dairy produce. There is a good Vegetable Garden. The Shooting extends over about 5000 acres, which have been very little shot over for many years. Other 4000 or 5000 acres adjacent may be obtained. The Game consists of grouse, black game, partridge, hare, and rabbits, and occasionally red deer. The Sea Fishing is excellent, and there are two small Trouting Streams on the Estate. There is a commodious Quay and Landing-place, and Steam-boats pass the house in the summer three times a-week.

TO SPORTSMEN, STOCK-FARMERS, ETC.

TO BE SOLD, a range of nearly 6000 acres of easily-travelled GROUSING GROUND, not surpassed in the Lowlands of Scotland for its sporting qualifications, and watered by several small Trouting Streams, having also a comfortable Small Lodge, all situated in the midst of several strictly preserved estates, in one of the most southerly counties, and of easy access from England or elsewhere, from being within five miles of a seaport, as well as forming a very improving and easily-managed investment as a Stock Farm for a moderate capital. The proprietor is ready to treat for a Sale of the same.—Apply, free, to No. 639, N.B.A.O., Edinburgh.

TO BE SOLD or LET, a MODEL FARM for Amateurs for 21 years, with immediate possession, in a good hunting district, 36 miles from London. Convenient Residence, good Grounds, &c. Two-thirds of Purchase Money can be left on Mortgage.—A. Q., Office of this Paper.

EGGS FOR SETTING may be had from the Yard of Mr. H. D. DAVIES, whose stock has been carefully bred and selected from all the best strains, and has already taken upwards of 250 Prizes. Spanish, Dorking, Brahma, and Rangoon Eggs, 2*l.* 2*s.*, and White Cochin and Aylesbury Ducks, 1*l.* 11*s.* 6*d.* the dozen, to include basket, &c. Spanish and Dorking Fowls of all ages may be selected from that portion of the stock not required for breeding or exhibition this season. For Cock and 1 Pullet, 5*l.* 5*s.*; Cock and 2 Pullets, 7*l.* 7*s.*; Cock and 4 Pullets, 10*l.* 10*s.*—Remittances, by Post-office Order, payable to GEORGE KEEBLE, the Bailiff, Spring Grove House, Hounslow, to accompany all orders.—Mr. DAVIES will feel obliged if persons who wish to see the Poultry will make it convenient to do so between the hours of 10 and 4 on any Wednesday or Saturday.

GOLDEN-SPANGLED HAMBURGH EGGS (fresh) from First-rate Birds, 10*s.* per set of 13.—Apply to Mr. J. COMPTON, Porchester, Fareham, Hants.

TO BE SOLD, BUFF COCHIN CHICKENS, from first class Prize Birds, Brahma Pootra Chickens, from imported American Prize Birds, and Spanish Chickens. Also some very good one-year-old Birds of the above descriptions. Wire, Game, and Poultry Netting, Poultry Hurdles, Hen-houses, Chicken Coops, Flower Stands, and Trainers, Garden Arches, and every kind of Wire Work, useful and ornamental.—T. H. Fox's, City of London Wire Works, 44, Skinner Street, and 6 & 8, Snow Hill.

Illustrated Catalogues forwarded post free.

TO BE SOLD, a young THOROUGH-BRED GUERNSEY BULL, of great size, beauty, and symmetry. Any admirer of this popular breed may secure a very perfect animal on application to JAMES MILEHAM, the Bailiff at Apps Court, two miles from the Hampton Court Station; or by letter addressed to Apps Court, West Moulsey, Surrey.

TULIPS.

TO BE SOLD, a well selected bed, of 60 rows, from the collections of Messrs. Goldham, Sanders, Delaforce, and most growers of celebrity, comprising many first class and new varieties; also the stage complete, cabinet for 168 rows, &c., the property of Mr. Clark, 1, Alpha Place, Coburg Road, Old Kent Road, who is giving up the cultivation on account of ill health.—May be viewed on the 23d, 24th, and 25th May. The stock being too limited to admit of sale by Auction, Mr. C. would treat with any purchaser for all or part.

Sales by Auction.

ORCHIDS ESTABLISHED AND IMPORTED PLANTS.

MR. J. C. STEVENS will Sell by Auction, at his Great Room, 38, King Street, Covent Garden, on TUESDAY, 8th May, at 12 o'clock, a magnificent Importation of ORCHIDS, just received per Solent, in the finest condition, from Santa Catarina and San Paulo, comprising splendid masses of Lælia purpurata and Brysiana, and a quite new species; Cattleya Leopoldi, elegans, tigrina, Russelliana superba, lobata, and many other species; also some established and flowering plants of Odontoglossum Pescatorei and maculatum; Uropedium Lindeni, and Odontoglossum Reichenheimi, nebulosum, phalænopsis, and hastilabium.—May be viewed on the morning of sale, and Catalogues had.

TO GENTLEMEN, FLORISTS, AND OTHERS.

MESSRS. PROTHEROE AND MORRIS will sell by Auction, at the Mart, Bartholomew Lane, on FRIDAY, May 11th, at 12 o'clock, a first class collection of Carnations, Picotees, and Pinks, choice Dahlias on dry roots, Verbenas, Fuchsias, Heartsease, &c.; with Geraniums, Azalea indica, and other plants in bloom.—On view the morning of sale. Catalogues had at the Mart; and of the Auctioneers, American Nursery, Leytonstone, Essex.

BLACKHEATH.

TO NOBLEMEN, GENTLEMEN, NURSERYMEN, AND OTHERS.

8000 BEDDING AND OTHER GREENHOUSE PLANTS.

MESSRS. PROTHEROE AND MORRIS are instructed to sell by Auction, without reserve, in the Lecture Hall adjoining the Blackheath Station of the North Kent Railway, on THURSDAY, May 10, at 1 o'clock, a choice collection of Fancy and other Pelargoniums, Tom Thumb and fine Scarlet Geraniums in varieties, Verbenas, Heliotropes, Calceolarias, Petunias, Fuchsias, Lobelias, Pentstemons, Phlox, Dahlias; also selected assortment of Azalea indica, Ericas, Epacris, Aphlexis, Leschenaultias, Acacias, &c.—May be viewed one day prior, and morning of sale; Catalogues may be obtained at the place of sale; of Mr. DROUET, Crown Inn, Tranquil Vale, Blackheath; of the principal Seedsmen in London; and of the Auctioneers, American Nursery, Leytonstone, Essex.

TULIPS IN BLOOM.

MESSRS. PROTHEROE AND MORRIS will sell by Auction, without the least reserve, on MONDAY, May 28, at 1 o'clock precisely, the ENTIRE COLLECTION of TULIPS in BLOOM of Mr. John Edwards, and now growing at the Paradise Nursery, Hornsey, and Seven Sisters Road, Holloway, Middlesex, where by the kind permission of Mr. Robert Parker, they may from time to time be seen. The bed is 200 rows in length, and contains over 2000 full sized first class Blooming Bulbs, including most of the show flowers extant, all of the finest strain, and collected during the last 12 years at a cost exceeding 1000 guineas.

Catalogues may be had for two postage stamps of Mr. R. Parker, as above: of Mr. Turner, Royal Nursery, Slough; Mr. J. Keynes, Salisbury; Mr. Wood, the Coppice, Nottingham: Mr. E. S. Dodwell, Derby; Mr. Lightbody, Falkirk, N.B.; Mr. Slater, Cheetham Hill, Manchester: at the Office of this Paper; and of the Auctioneers, American Nursery, Leytonstone, Essex.

MITCHAM.—TO TULIP FANCIERS.

MESSRS. PROTHEROE AND MORRIS have received instructions from Mr. Goldham to submit to public competition by auction, without reserve, on the premises, Hynder Cottage, Merton Lane, Mitcham, Surrey, on FRIDAY, May 25, at 1 o'clock, a portion of his costly and unrivalled Collection of TULIPS. No comment on this magnificent stock will be equal to an inspection of its striking beauties, for which an opportunity is now offered to the amateur florist, &c. New Flowers and Seedlings of Mr. Goldham's raising—the result of more than 30 years' successful cultivation and competition; among these are—Fanny Kemble, John Kemble, Charles Kemble, Julius Cæsar, Napoleon, Fortunatus, Gem, Duchess of Sutherland, Standard, Lord Byron, Marshal Soult, Marshal Blucher, Emma, Calphurnia, Oliver Goldsmith, Othello, Comet, Biz, Mark Antony, Sir R. Peel, Helen, Lord Nelson, Picturata, Unique, Byb. Belvidera, Juliet, Marquis of Anglesea, Unique Rose, and Mount Hecla. Among Flowers raised by other growers are—Pandora, Thalia, Musidora, Matilda (new), Lord J. Russell, Apelles, Duke of Devonshire, Mrs. Siddons, Feu devorent, Stein's Victoria, Strong's Eliza, St. Neots, Fanny Ellsler, Parmeziano, General Bournonville, Louis XVI., Polydora, Wallace, Rutley's Queen, Duchess of Manchester, Commodora, Lord Collingwood, &c.—May be viewed two days prior to the Sale; Catalogues had on the premises; of the principal Seedsmen in London, and of the Auctioneers, American Nursery, Leytonstone, Essex.

NEW AZALEA—"ALBA MELIOR."

THIS is the one exhibited by us under the name of "ALBA MAGNA" among our collection to which the First Prize was awarded at the Regent's Park Show; very large pure white, and quite first-rate. Price 7*s.* 6*d.*, 10*s.* 6*d.* to 21*s.* each. Also a superior stock of Azaleas, for which see Catalogue.

The Spring Catalogue, consisting of Greenhouse and Stove Plants, and the Herbaceous one can be had by enclosing one postage stamp.

H. LANE & SON, The Nurseries, Great Berkhamsted.

HOLLYHOCKS, HOLLYHOCKS, HOLLYHOCKS!

THOMAS WILD, Ipswich, offers for sale 100 packets, each containing 100 Seeds, saved by a gentleman who grows all the best varieties for Exhibition, 1*s.* per packet. The usual discount to the trade.

Ipswich Standard Cucumber, Primulas, and Golden Chain Geraniums, are sold out.

NOTICE.—Wanted 100 dozen GOLDEN CHAIN GERANIUMS. State size and price to T. WILD, Ipswich.

UNBLOOMED SEEDLING CALCEOLARIAS.

MR. HENRY MAJOR, Knosthorpe, near Leeds, begs to announce that his UNBLOOMED SEEDLING CALCEOLARIAS are now ready to send out in parcels of 20, at 6*s.* per parcel, or four parcels for 1*l.*, post free. They have been produced from rich and beautiful varieties, therefore good and beautiful colours and markings may reasonably be expected.

A few sets of H. M.'s beautiful new Seedling Calceolarias, so highly spoken of by Mr. Glenny, still remain; price 3*l.* the set. The usual discount to the Trade for cash only. Twelve very choice Calceolarias, to include all his best sorts sent out last year, price 25*s.* A descriptive Catalogue of the new Calceolarias may be had on application. From unknown correspondents a remittance is respectfully requested with the order.

JOHN ELSON is now sending out his new CINERARIA, MASTER ARTHUR UNDERHILL. Colour intense blue and white; good habit, very free bloomer; the admiration of all that have seen it. Was awarded first class Certificate at the Wolverhampton Horticultural Show, June, 1854.

Mr. GLENNY'S *Opinion*:—"A fine large bright flower, and very showy."

Mr. C. TURNER.—"A more showy flower there could not be."

Good strong plants, 7*s.* 6*d.* each, or three for 1*l.* 1*s.*

JOHN ELSON, Gardener to H. Underhill, Esq., Purton Grove, Wightwick, near Wolverhampton, Staffordshire.

J. COLE begs to inform the admirers of Calceolarias that he is now prepared to supply a few more orders from his Choice Stock of Unbloomed SEEDLINGS—the seed was saved from the choicest spotted and striped varieties, carefully impregnated—at 3*s.* and 4*s.* per dozen, 20*s.* and 25*s.* per 100. Also strong plants of his Fine Bedding Calceolaria Prince of Orange, for habit and profusion of bloom unequalled. Strong Plants without pots, 6*s.* per dozen; well established, 9*s.* per dozen.

The Trade liberally supplied. A Remittance solicited from unknown correspondents. Post-office Orders payable at St. Alban's.

Keyfield Nursery.

A. STANSFIELD AND SON beg to offer the following:—

1000 species and varieties of Herbaceous and Alpine Plants at 4*s.* per dozen, or 30*s.* per 100.

500 species and varieties adapted for Rockwork at 4*s.* per dozen.

200 species and varieties of Hardy Greenhouse and Stove Ferns and Lycopods, at from 6*s.* per dozen, and upwards.

Verbenas, Fuchsias, Geraniums, and other Bedding Plants, at from 3*s.* 6*d.* per dozen. Catalogues on application.

*** 100 bushels of selected Fluke Potatoes at 4*s.* 6*d.* per bushel of 56 lbs. Dean's Seedling Fluke at 3*s.* 6*d.* per stone of 14 lbs.

Vale Gardens, Todmorden, Lancashire.—April 28.

ORCHIDS.

WILLIAM MAULE AND SONS have received their annual importations of ORCHIDS from their collectors in the East, which they beg to offer on the following terms, many of which are one and two years established:—Vanda cærulea, 21*s.*, 42*s.*, 63*s.*, 105*s.*; Vanda teres, 10*s.* 6*d.*; Aerides odoratum, 10*s.* 6*d.*; Aerides affine, 42*s.*; Foxbrush, 105*s.*; Dendrobium Devonianum, 10*s.* 6*d.*; Cambridgeanum, 10*s* 6*d.*; Gibsoni, 10*s.* 6*d.*; densiflorum, 10*s* 6*d.*; Farmeri, 10*s.* 6*d.*, 15*s.*; Chrysanthum majus, 7*s.* 6*d.*; nobile, mixed with Wallichi, 7*s.*6*d.*; Pierardi, mixed with latifolium, 7*s.*6*d.*; clavatum, 15*s.*, 21*s.*; moschatum, 10*s.* 6*d.*; Camarotis purpurea, 10*s.* 6*d.*; Coelogyne or Pleone, Wallichi, and maculata, in pots, with four or five plants or bulbs, 10*s.* 6*d.* each; Saccolabium ampullaceum (VERY scarce), small plants, 63*s.* each. The Nurseries, Bristol.

NEW WHITE VERBENA, "MRS. FOSTER."—This very desirable variety was raised by Mr. EDMONDS, Gardener to the Rev. R. FOSTER, of Scratby Hall, and is acknowledged to be the very best pure White Verbena that has yet been originated for bedding purposes, it has also been favourably noticed by the National Floricultural Society. It is of a robust but very compact habit; the heads of bloom (which are produced in profusion) are large and flat; the individual flowers, in point of size and shape, resemble those of a finely-formed Phlox—stout, and of the purest white. This Verbena will supersede all other White Verbenas in commerce. Strong plants are now ready for sending out at 5*s.* each, with one over every three to the trade.—YOUELL & Co., Royal Nursery, Great Yarmouth.

WELLINGTONIA GIGANTEA.—Ample description of this noble tree having appeared in former advertisements or circulars, it is only necessary now to say that it is a Coniferous Tree, of immense dimensions and great beauty. It having withstood the severity of the past winter, without injury, both at Chelsea, Exeter, and various other localities, there can be no doubt of its being a perfectly hardy tree, thus rendering it the most remarkable of recent introductions.

MESSRS. VEITCH & SON can supply healthy well established plants at the following prices:—

A few of the first raised, extra sized plants ...	42*s.* 0*d.*
Second size	31 6
Third size	21 0

A reduction will be made on the above prices in proportion to the quantity taken.—Prices to the Trade on application.

Nurseries, Exeter and Chelsea.—May 5.

WILLIAM BARNES respectfully informs his friends and the public generally, that his SPRING CATALOGUE is now ready for distribution, and will be sent, post free, upon application; it comprises all the leading varieties of Indian Azaleas, Cinerarias, Verbenas, Hollyhocks, Phloxes, Roses, Geraniums, Chrysanthemums, Perpetual Carnations, Liliums, Delphiniums, Antirrhinums, Petunias, Calceolarias, and a good collection of all the most popular plants in cultivation.

Camden Nursery, Camberwell, London.

WHEELER AND SON'S SHORT SELECT SEED LIST.—Our Priced List of Seeds for this season, containing Descriptions and Prices of the best GARDEN and FLOWER SEEDS, will be forwarded free by post. It is our earnest endeavour to send out all Seeds, whether for the Garden or Farm, of the very best quality and true to name; and as many of the Seeds are our own growing, and are proved before sending out, we generally succeed in giving entire satisfaction to our customers.

We are in daily receipt of most gratifying letters and renewed orders from those we had the honour of serving last year; and as we deliver our Seeds CARRIAGE FREE, we very respectfully solicit the honour of an order from those who have not yet given us a trial.—J. C. WHEELER & SON, Gloucester, Seedsmen to the Gloucestershire Agricultural Society.

NORTH AMERICAN HERBACEOUS PLANTS.

HUGH LOW AND CO. have to offer the undernamed, which are all in a very healthy condition. Amongst the plants now offered will be found many rarities, and attention is particularly called to the Sarracenias, which are strong and vigorous, imported during the past winter direct from their native localities.

	s. d.		*s. d.*
Asplenium acrosticheides	2 6	Onoclea obtusiloba...	2 6
" ebaneum	2 6	Parnassia Caroliniana	1 6

These Seeds are all new, and have all been properly cleaned and their growing properties fully tested. Directions for sowing accompany the seed.

G. G. and Co.'s New Priced AGRICULTURAL CATALOGUE is now ready, and will be forwarded free on application.

GEORGE GIBBS & CO., SEEDSMEN,

26, Down Street, Piccadilly, London.

GRASS AND AGRICULTURAL SEEDS.

THOMAS GIBBS AND CO., the SEEDSMEN to the Royal Agricultural Society of England, beg to inform their friends and agriculturists generally that they are now prepared to supply the undermentioned in any quantities required.

Mixtures of Grass Seeds for laying down land to permanent Pasture and Meadow; Irrigation or Water Meadow Mixtures; Upland Sheep Walk Mixtures; Park and Field Lawn Mixtures; Renovating Mixtures for old Swards; Garden, Lawn, or Grass-plot Mixtures; various Permanent Grass Seeds supplied separately to order; Mixtures for one year's lay, do. for two or three years' lay (commonly called "seeds").

CLOVERS.—Red or broad leaved, white or Dutch, Red Suckling, Alsike or Hybrid, Trefoil, Cow Grass or Perennial.

RYE-GRASSES.—Italian (very fine), Annual, improved Perennial, and other kinds.

CARROTS.—Large White Belgian, large field Altringham, Yellow Belgian, long Orange or Surrey.

PARSNIPS.—Gibbs' large Guernsey Cattle, common large.

MANGOLD WURZELS.—Long Red, Orange or Yellow Globe, Red Globe, long Yellow.

CABBAGES.—Large Drumhead Cattle, Thousand headed.

TURNIPS.—Purple-top Swedes, Green-top Swedes, Skirving's Swedes, Green-top Yellow Hybrid, Red-top Yellow Hybrid, Globes or Rounds, Tankard's sorts, Kohl Rabi.

Lucerne, Broom, Furze or Gorse, Field Parsley, Rape, Seed Barley sorts, Wheat sorts, Rye, Sainfoin, Tares, White Mustard, White Silesian Beet, Peas, Potatoes, and all other seeds for the farm.

KITCHEN GARDEN AND FLOWER SEEDS, including all the new and most approved varieties. Assortments made up to suit different sized gardens, or to any given amount.

Priced Lists of both Agricultural and Garden Seeds sent free by post on application to THOMAS GIBBS & Co., Corner of Half Moon Street, Piccadilly, London.

ESTABLISHED ABOUT HALF A CENTURY.

AGRICULTURAL SEEDS OF THE FINEST SELECTED STOCKS.—*As the quantity of Mangold, some of the Turnips, &c., are found not so scarce on the market as was expected at the close of harvest, we submit our present prices, in which several will be found lower than quoted in our Spring Catalogue.*

	Per lb.—*s.*	*d.*		Per lb.—*s.*	*d.*
Mangold Wurzel, Long Red	0	8	Turnip White Decanter, or Norfolk Bell	1	2
" " Long Yellow	1	0	" Green Barach	1	2

" " Green Round	0	9	Furze or Gorse	1	0
" Lincolnshire Red Globe	1	2	Alsike Clover	2	0
" Pomeranian White Globe	1	2	Bokhara Clover	2	6

PERMANENT PASTURE AND OTHER GRASSES.—Our Mixtures for Permanent Pastures will be found equal to any which are supplied. Prices per acre, according to the nature of the soil, 24*s.* to 34*s.* Wholesale Prices of Grasses and other Seeds to the trade on application.

Finest Mixed Lawn Grasses, per lb. 1*s.*, or 4*s.* 6*d.* per peck.

☞ GOODS CARRIAGE FREE (not under 20*s.*) to all the London termini, or any station on the Colchester and Norwich line.

BASS AND BROWN, Seed Establishment, Sudbury, Suffolk.

AGRICULTURAL SEEDS.

JOHN SHARPE (late of Sleaford), SEED GROWER and MERCHANT, Bardney, is now sending out, of the purest and best selected stocks, Permanent Grass Mixture, 2*s.* per acre; Upland Sheep Walk, 20*s.* per acre; Field or Lawn Mixtures, 9*d.* per lb.; Improving Mixtures for old Swards.

CLOVERS.—Red, English, Dutch, German, French, 6*s.* to 8*s.* per stone; White, 8*s.* to 10*s.* per stone; Italian Rye-grass, fine, imported, 6*s.* to 7*s.* per bushel; Perennial Rye-grass, 25*s.* to 28*s.* per quarter; Mangold Wurzel, 8*d.* per lb., or 7*s.* per stone.

TURNIPS.—Skirving's and Purple-top Swedes, transplanted, and of the purest characters, 1*s.* 3*d.* per lb., or 60*s.* per bushel of 50 lbs.; White Globe or Round, 8*d.* per lb., or 30*s.* per bushel of 50 lbs.; Green Globe or Barrel, 8*d.* per lb.; White and Red Tankards, Lincolnshire Red Globe or Round, Early Sixweeks, Yellow Aberdeen, Orange Jelly, and other yellow-fleshed kinds.

Rape Seed or Cabbage Cole, 3*s.* 6*d.* per peck, or 12*s.* per bushel.

White Mustard, Spring Tares, &c.

For quantities, Purchasers treated with liberally.

Attendance at Sleaford, Market Rasen, Boston, Louth, Lincoln, and Horncastle, on market days.

Bardney Hall, near Lincoln, May, 1855.

THE FORWARDEST TURNIP KNOWN.

SUTTON'S EARLY SIX WEEKS' TURNIP should now be sown for feeding off early. Excellent new seed 1*s.* 2*d.* per lb., 6*s.* per gallon, or 42*s.* per bushel. Mr T. Hickman, of Brimpton House, near Newbury, in a letter dated February 1, says:—

"*I must mention the Six Weeks' Turnip as the best sort I have ever seen for earliest and latest sowings. I have grown them several years, and have invariably found them to produce more seed in less time than any other Turnip. I have had them after Wheat of a good size, within six weeks from the time of sowing.*"

N.B. Carriage free, except parcels under 20*s.* value.

Address, J. SUTTON & SONS, Seed Growers, Reading, Berks.

TO GENTLEMEN ABOUT TO DECORATE THEIR LAWNS, TERRACES, OR GARDENS.—A very handsome and beautiful Variety of FOUNTAINS, FIGURES, VASES, &c. &c., warranted to stand all weather, are now being offered at greatly reduced prices, at MR. SCOTT'S ARTIFICIAL STONE WORKS, 74, Borough Road, Southwark. Illustrated Catalogues free of charge forwarded to any part of the country.

IMPORTANT SALE.

GRECIAN TAZZA FOUNTAIN, consisting of three Basins, five pair handsome Vases, and two rustic Piers, 7*ft.* high; this lot will be sold very cheap to effect immediate sale.—Apply to Mr. J. VIRGO, High Street, Camberwell.

GARDEN VASES, FOUNTAINS, ETC.

THOMAS SOMMERVILLE, LANDSCAPE GARDENER, NURSERYMAN, SEEDSMAN, and FLORIST, Garden Road, St. John's Wood, London, begs respectfully to inform the nobility, gentry, and his patrons generally, that he has entered into arrangements with an eminent company in Scotland for the sale and disposal in London of their highly ornamental and very durable Vases, Fountains, &c., samples of which may be seen at his grounds in the Garden Road, as above.

T. S. has much pleasure in being the first to introduce to the notice of the public a highly ornamental Vase, capable of resisting the most severe weather, and at little more than half the cost of any other possessing the same qualities; and he has no hesitation in stating that a more suitable Vase for the growth of plants cannot be manufactured.

Printed by WILLIAM BRADBURY, of No. 13, Upper Woburn Place in the Parish of St. Pancras, and FREDERICK MULLETT EVANS, of No. 27, Victoria Street, in the Parish of St. Margaret and St. John, Westminster, both in the County of Middlesex, Printers, at their Office in Lombard Street, in the Precinct of Whitefriars, in the City of London; and published by them at the Office, No. 5, Charles Street, in the Parish of St. Paul's, Covent Garden, in the said County, where all Advertisements and Communications are to be ADDRESSED TO THE EDITOR.—SATURDAY, May 5, 1855.

GORE HOUSE, KENSINGTON GORE.

EXHIBITION OF THE HORTICULTURAL SOCIETY, MAY 16.—The Gates at Gore House will be open to the Public at 2 P.M. Tickets, price 5*s*. each, will be issued daily at 21, Regent Street, till the afternoon of May 15.

SPECIAL PRIVILEGE OF FELLOWS.—Fellows of the Society not only enter free at half-past 12, but can also each introduce two friends, with Tickets, at the same hour. Or the Fellow's power may be transferred to a near relative, provided the person to whom the transfer is made be furnished with a ticket signed by that Fellow. That is to say, a near relative, if provided with an admission ticket, may enter at half-past 12, instead of a Fellow, and also introduce two friends.

HORTICULTURAL SOCIETY OF LONDON.—FIRST SUMMER MEETING, MAY 8, 1855.

ROYAL BOTANIC SOCIETY, REGENT'S PARK.—The List of Prizes awarded at the Exhibition held on WEDNESDAY, May 9th, will be advertised in the *Gardeners' Chronicle* on Saturday next, the 19th.

NORTH LONDON FLORICULTURAL SOCIETY will hold their ANNUAL EXHIBITIONS this season on TUESDAY, Sept. 18, for DAHLIAS and MISCELLANEOUS; and on MONDAY, Nov. 19, for CHRYSANTHEMUMS; in the Penton Rooms, Pentonville, London. The Schedules are now ready, and can be obtained on application to

GEO. SMITH, Hon. Sec., Hornsey Road, Islington.

SOUTH LONDON SOCIETY OF AMATEUR FLORISTS.—The Second Exhibition of the season will take place at the HORNS TAVERN, KENNINGTON, on THURSDAY, 31st of May, when Prizes will be offered for the following productions, viz.—Tulips, Heartsease, Pelargoniums, Auricula, Fancy varieties ditto, and Miscellaneous Plants. In addition to the Prizes offered by the Society, Mr. R. I. Laurence, of Clapham, offers to Amateurs 5*l*. value in Tulips, to be selected from his best bed when in bloom, to be divided into Four Prizes. Admittance to Non-Members from 2 till 7 o'clock, at 6*d*. each. The Efficient Band will be in attendance. List of Prizes and the Rules of the Society may be obtained from

JOHN BUSHELL, Hon. Sec.

Lower Kennington Lane, Lambeth.

KENILWORTH AND LEAMINGTON FLORAL EXHIBITION.—The Second Grand Horticultural Fête will be held, by permission, among the ruins of Kenilworth Castle, on WEDNESDAY, 4th day of July next, when, in addition to the sum of 80*l*. offered in prizes by the Committee, Silver Cups, of 5*l*. value each, contributed by the inhabitants of Kenilworth, will be awarded to the two most successful competitors. Schedules, and every particular, may be had on application. J. [illegible] Secretary.—Priory Gardens, Warwick.

POSTPONEMENT.

ROYAL NATIONAL TULIP SHOW, under the Gracious Patronage of HER MAJESTY and HIS ROYAL HIGHNESS PRINCE ALBERT.—This Grand National Exhibition will be held, in connection with the May Show of the Cambridge Horticultural Society, at Cambridge, on TUESDAY, May 29th, instead of May 22d, as previously advertised; for which occasion a most liberal schedule of prizes has been announced—larger in amount than has been offered at many of the previous meetings. The Show will be held in the grounds of the Old Botanic Garden, subject to similar regulations to those issued at former exhibitions. Subscriptions and entrance-money to be paid to the Hon. Secretary (CHARLES EDWARD BROWN), by Post Office Order, payable at Cambridge.—All articles to be in the grounds by 10 o'clock on the morning of the Show.

GOOD SWEDE SEED.

SUTTON AND SONS *have good new Ashcroft, Skirving's, and other Swede Seeds, true to their kinds, warranted all of last year's growth.* Price, in large or small quantities, 2*s*. per lb. Large quantities CARRIAGE FREE. Remittances or references required from unknown correspondents.

Address, SUTTON & SONS, Seed Growers, Reading.

THE PERENNIAL WHITE CLOVER.—This Clover is included in all Messrs. Sutton's mixtures for Permanent Pasture, and is very superior to the common White Clover; it may be purchased separately, price 1*s*. 6*d*. per pound.

Address—SUTTON & SONS, Seed Growers, Reading.

SUTTON'S LARGE YELLOW GLOBE MANGOLD WURZEL, FROM SELECTED ROOTS, QUITE HARDY.—Seed of this fine large Mangold Wurzel may be obtained genuine of Messrs. SUTTON, price 1*s*. per lb., or 5*l*. per cwt.; other sorts cheaper. Early orders are requested and recommended, as the stock is limited.—Address,

JOHN SUTTON & SONS, Seed Growers, Reading, Berks.

MORTON'S YELLOW GLOBE MANGOLD.—*From Seed grown from the original stock of J. C. Morton, Esq., the Editor of the* AGRICULTURAL GAZETTE. 1*s*. 6*d*. *per lb.*

WILLIAM E. RENDLE & Co., SEED MERCHANTS, Plymouth.

WHITE BELGIAN CARROT, 2*s*. *per lb., or much cheaper by the cwt.*

WILLIAM E. RENDLE & Co., SEED MERCHANTS, Plymouth.

TRUE GUERNSEY PARSNIP.—*This is a large and superior sort, and can be strongly recommended. The Subscribers have just imported a choice lot of Seed from Guernsey, and can supply it at 2s. per lb.*

WILLIAM E. RENDLE & Co., SEED MERCHANTS, Plymouth.

DAVID FERGUSON, LANDSCAPE GARDENER, GARDEN ARCHITECT, and CONTRACTING PLANTER, Stowe, Buckingham. Now is the time to prepare for planting in September, October, and November.

WILLIAM MASTERS AND SON, LANDSCAPE GARDENERS, Exotic Nursery, Canterbury.

WILLIAM BARRATT, LANDSCAPE GARDENER, Wakefield.

*** Plans and Estimates furnished.

JOHN KERNAN begs to offer the following list of AGRICULTURAL SEEDS:

Agricultural Carrots, Red and White, 1*s*. per lb.

Mangold Wurzel, of sorts.	1*s*. per lb.	Italian Rye-grass (imported).
Skirving's Swedish Turnip.		Mixed Permanent Grasses.
Laing's Purple-topped do.		Parsley for Sheep-walks.
Ashcroft Purple-topped do.		Cattle Cabbage.
Green-topped do.		Thousand-headed do.
Yellow Bullock do.		Clover, Red and White.
White and Red Globe do.		Trefoil and Lucerne.
Dale's Hybrid do.		

The Trade supplied. Seeds carefully packed for all climates. Catalogues may be had on application.

4, Great Russell Street, Covent Garden.

NEW PLANTS.

A. VERSCHAFFELT, NURSERYMAN, Ghent (Belgium), is now sending out his following New Plants:

Achimenes Ambroise Verschaffelt	8*s*.	0*d*.
" Docteur Hopf	8	0
" Edouard Otto	4	0
" Edmond Boissier	8	0
Tydæa Warscewiczi	15	0
Rhododendron Prince Camille de Rohan (quite hardy)	16	0

All the above Plants are figured in VERSCHAFFELT'S "Illustration Horticole," which can be seen at Mr. R. SILBERRAD'S, 5, Harp Lane, Great Tower Street, London.

WILLIAM KNIGHT, FLORIST, &C., begs to offer the following Superb FLOWER SEEDS, saved from the best varieties, post free:—

	Per packet.
Antirrhinum, from 100 striped and spotted varieties	0*s*. 6*d*.
Balsam, from 25 best double varieties	0 6
Hollyhock, from 50 best show flowers	0 6
Fancy Pansy, from a choice collection	1 0
Mimulus, from 12 of the most showy kinds	0 6
Verbena, from 100 of the newest and best varieties	1 0
Pansy, from 100 best show flowers	1 0
Gloxinia, from 50 newest varieties	1 0
Double Daisy, from 60 newest varieties	0 6
Sweet William, from 50 fine varieties	0 6

67, High Street, Battle, Sussex.

BEDDING AND OTHER PLANTS.

F. AND A. SMITH'S Descriptive LIST of the undermentioned is now ready, and may be had, post free, on application:—Antirrhinums, Verbenas, Fuchsias, Scarlet Geraniums, Calceolarias, Petunias, Heliotropes, Pentstemons, Chrysanthemums, Mimulus, Salvias, Lobelias, &c. Climbers in variety, also a miscellaneous Collection of Greenhouse Plants. They have now in bloom Cytisus racemosus, Roses, Verbenas, Fuchsias, spotted Calceolarias, Erica Hybrida, Cactus, Geraniums, &c. The Trade supplied.—Dulwich, Surrey, May 12.

BEDDING PLANTS.

JOHN HAYES, FLORIST, Farnham, Surrey, begs to offer the above from 1*s*. to 4*s*. per dozen, the latter end of May, when the weather will permit. Catalogues sent on the receipt of one postage stamp.

FLOWERING PLANTS.

F. AND A. SMITH beg to offer FLOWERING PLANTS of the following (in quantities to the trade):—Geraniums, Fuchsias, Verbenas, Heliotropes, Calceolarias, Hydrangeas, Roses, Cactus, Ericas, Burchellia, Kalosanthus, Neriums, Scarlet Geraniums, &c. Prices on application. The Plants are stocky and in good condition: an inspection solicited.—Dulwich, Surrey.

MESSRS. JOHN WEEKS AND CO. have now ready a well grown stock of BEDDING PLANTS, selected from the best existing varieties, and at most reasonable prices.

Horticultural Establishment, King's Road, Chelsea; and at Frankfort-on-the-Maine.

FLOWER SEEDS.

PETER LAWSON AND SON, SEEDSMEN and NURSERYMEN to the QUEEN, Edinburgh, and at 27, St. George Street, Westminster, beg leave to invite attention to their very choice selection of Flower Seeds.

27, St. George Street, Westminster.

OSAGE ORANGE (MACLURA AURANTIACA).

CHARLWOOD AND CUMMINS can supply SEED of the above-named Hedge Plant at 6*s*. per lb., with full directions for treatment. The month of May is the best time for sowing.—14, Tavistock Row, Covent Garden, London.

BANKS' SEEDLING FUCHSIAS.

W. J. EPPS begs to say he is now sending out three of the above splendid FUCHSIAS, strong plants, namely, Climax, Maid of Kent, and Omer Pacha; the other three will not be ready till next week. They will be sent carriage free to all orders on hand.—Bower Nurseries, Maidstone.

DWARF FRENCH BEANS can be had in any quantity.—Apply to J. G. WAITE, Seed Merchant, 181, High Holborn, London.

THE FINEST CRIMSON DAHLIA OF THE SEASON, ABLITT'S "INCOMPARABLE."—It is the brightest of its class, and full size. Perfect outline, very deep, full, compact, and symmetrical; and for a flower so beautifully cupped, well up, and good in the centre.—Mr. GLENNY'S *Opinion.*

☞ Strong healthy plants, at 10*s*. 6*d*. per pair, may now be had of Mr. BARNES, Stowmarket; Mr. TURNER, of Slough; and of EDWARD ABLITT, Ohehouse, Stowmarket, Suffolk.

CHOICE PANSIES.

HART AND NICKLIN, FLORISTS, &c., Guildford, offer the following, the set for 12*s*.:—Boadicea, Elegantissima, France Cycole, Sir J. Paxton, Constance, National, Criterion, Alfred the Great, Caroline, Sylvia, Sultan, Marchioness of Bath, Eva, Ophir, Mr. Beck, Duke of Perth, British Queen, Euphemia, Adela, Blanche, Royal Purple, Pompey, Lady Carrington, and Lord Jeffrey.—Choice varieties, 4*s*. per dozen.

MAY'S MAGNUM BONUM LETTUCE is by far the largest, sweetest, and crispest Lettuce known, in proof of which we possess numerous letters received from parties who had it last season. The addresses of the writers can be had on application. It may be sown all the summer, and will stand the winter. Packets 1*s*. each.

HENRY MAY, the Hope Nurseries, near Bedale, Yorkshire.

T. F. WINSTANLEY'S BEDDING PLANT LIST is now ready, and can be had on application, or free by post.—28, Market Place, Manchester.

TO BE SOLD, about 300 strong healthy young PINE PLANTS.—For price and particulars apply to GEORGE THOMPSON, Seedsman, Florist, &c., 136, Northgate Street, Chester.

FERNS.

TO BE SOLD, twelve distinct species of BRITISH FERNS, correctly named, collected from their Natural Habitats, and delivered in the neighbourhood of London or sent by rail. The Set, one of each sort, for 5*s*.; two of each, 8*s*.; four of each, 15*s*.; or 100 plants for 25*s*.—JOHN LLOYD, Post Office, East Hill, Wandsworth, Surrey.

BOSSOM'S CHAMPION OF ENGLAND CELERY.

THE finest Celery yet introduced, beautifully white, very crisp and solid, and withstands a greater amount of frost than any other known variety; it has been blanched in the ground 3 feet.—To be obtained of T. F. WINSTANLEY, Seedsman, 28, Market Place, Manchester, price 2*s*. 6*d*. per packet; prices to the trade on application.

SUPERB HOLLYHOCKS, SEEDS, ETC.

WILLIAM CHATER begs to offer packets of seed, consisting of 20 varieties, from his best Show Hollyhocks, at 5*s*.; 12 varieties, 2*s*. 6*d*.; and from good double sorts, 1*s*.

Superior Quilled German and French Asters, in 12 varieties, mixed, 1*s*. per packet; separate, 2*s*. Fine Quilled African Marigolds, 6*d*. per packet.—Saffron Walden Nurseries.

NEW SCARLET VERBENA.—MRS. WOODROFFE.

ARTHUR HENDERSON AND CO. are now sending out this fine new VERBENA; particulars of which may be seen in their advertisement in the *Gardeners' Chronicle* of March 31. The usual discount to the Trade.

☞ This Verbena is the same as "Conqueror," one offered by another firm.—Pine-apple Place, Edgware Road, London.

NEW WHITE VERBENA, "MRS. FOSTER."—This very desirable variety was raised by Mr. EDMONDS, Gardener to the Rev. R. FOSTER, of Scrathy Hall, and is acknowledged to be the very best pure White Verbena that has yet been originated for bedding purposes. It has also been favourably noticed by the National Floricultural Society. It is of a robust but very compact habit; the heads of bloom (which are produced in profusion) are large and flat; the individual flowers, in point of size and shape, resemble those of a finely-formed Phlox—stout, and of the purest white. This Verbena will supersede all other White Verbenas in commerce. Strong plants are now ready for sending out at 5*s*. each, with one over every three to the trade.—YOUELL & Co., Royal Nursery, Great Yarmouth.

UNBLOOMED SEEDLING CALCEOLARIAS.

MR. HENRY MAJOR, Knesthorpe, near Leeds, begs to announce that his UNBLOOMED SEEDLING CALCEOLARIAS are now ready to send out in parcels of 20, at 6s. per parcel, or four parcels for 1l., post free. They have been produced from rich and beautiful varieties, therefore good and beautiful colours and markings may reasonably be expected.

A few sets of H. M.'s beautiful new Seedling Calceolarias, so highly spoken of by Mr. Glenny, still remain: price 3l. the set. The usual discount to the Trade for cash only. Twelve very choice Calceolarias, to include all his best sorts sent out last year, price 25s. A descriptive Catalogue of the new Calceolarias may be had on application. From unknown correspondents a remittance is respectfully requested with the order.

CHOICE BEDDING-OUT PLANTS,

And to those about Permanently Replenishing the Flower Garden.

YOUELL AND CO. beg to submit the following List of desirable PLANTS, suitable for the above purpose. Carriage paid on all Orders of 2l. and upwards to any distance within 150 miles of the Nursery, and good Plants added to compensate for this charge on packages of less value:—

CARNATIONS AND PICOTTES. Per doz. pairs.

Fine selections by name from our extensive and well-known Collection, in strong plants ...	18s. 0d.
Fine mixed border ditto	9 0
True old Clove Carnations	12 0
Tree Carnations, in choice variety ... ... each	1 6

CALCEOLARIAS.—Of this favourite flower the following list contains some of the best varieties for Bedding:—

Ajax (Lucombe Pince, & Co.), fine large rich coloured flower, of crimson and yellow, 1s. 6d. each.
Golden Chain, fine golden yellow, 6s. per dozen.
Gold Cap, rich dark maroon yellow cap, 9s. per dozen.
Superba (Constantine's), dwarf, rich crimson plum, 1s. 6d. each.
Surprise ... bright orange crimson, ex. fine, 12s per doz.
Sulphurea splendens, fine large yellow, 6s. per dozen.
Mr. White, rich shining bronze red, 6s. per dozen.
Superba (Turner's), fine dwarf, dark crimson (ex. fine), 6s. per doz.
Wellington Hero, rich deep golden yellow, 6s. per dozen.
Magnificent, large and rich crimson, with yellow crown, extra fine, 6s per dozen.
Masterpiece (Constantine's), deep maroon scarlet, dwarf, 12s. p. doz.
Mrs. Beecher Stowe, bright yellow, 6s.
Shankleyana, large orange crimson, extra fine, 9s.
Beauty of Montreal, bright crimson, dwarf, 6s.
Kentish Hero, orange bronze, fine, 6s.
Sultan, fine large crimson, 6s.
Viscosissima, deep yellow, 6s.
Calceolaria "Purity," a new and beautiful variety, pure paper white, dwarf, free habit, branching, and a most desirable bedding plant, very highly recommended, 7s. 6d.

SCARLET GERANIUMS.

Tom Thumb, Frogmore, and Trentham Scarlet, 4s. per dozen, [30s. per 100.
Amazon, 12s. per dozen.
Baron Hugel, a dwarf growing variety, with brilliant scarlet flowers, adapted for edging, 12s. per dozen.
Cerise Unique, colour a fine cerise, 9s. per dozen.
Defiance, an immense large flowering variety, 1s. each, 9s. per doz.

VARIEGATED GERANIUMS.

Brilliant ...	12s. per doz.	Golden Circle ...	18s. per doz.
Flower of the Day	9s. "	Manglesi variegata ...	12s. "
Dandy	9s. "	Mountain of Light	18s. "
Golden Chain ...	18s. "		

GERANIUM—Boule de Neige, a unique white-flowering, horse-shoe leaf variety, producing large trusses of well formed flowers, 9s. per dozen.
" Kingsbury Pet, a striking variety, bearing a fine truss of bright salmon-coloured flowers, 9s. per dozen.
" Manglesi Floribunda, a free blooming light variety, 9s. per dozen.
" Crimson Unique, for bedding purposes, a fine strong growing variety, 9s. per dozen.
" Crimson flowering Ivy leaf, fine, 9s. per dozen.
" White do. do. 6s. "
" Miss Emily Field, 12s. per dozen.
" Skeltoni, 12s. per dozen.

FUCHSIAS.—The following fine varieties, 9s., viz.:—Queen of Hanover, Elegans, Vanguard, Uterpe, Monarch, Trentham, Autocrat, Duke of Wellington, Mrs. Patterson, Princeps, Lady Franklin, England's Glory, Perfection, Model, &c. The best of the older varieties, 6s.
Fuchsia Domminiana, 2s. each.
Petunias, of best kinds, 6s. to 9s. per dozen.
LOBELIA racemoides, the best dark blue variety, 4s. per dozen.
" lucida do. light do. 4s. "
" compacta alba do. white do. 4s. "
" Lindleyana, a decided lilac do. 6s. "
VERBENAS.—In this class particular attention has been given to introduce only those of the more striking colours and best habits for bedding purposes: these include all the handsomest of the new continental varieties, and we offer them at 4s. per dozen, or 30s. per 100.
Anagallis rubra, and grandiflora, 6s. per dozen.
Nierembergia filicaulis, 6s. per dozen.
Pentstemon azureum, 9s. per dozen.
Salvia lilacina, 9s. per dozen.
PHLOX NELSONI.—An extremely pretty and hardy variety, originated through the zeal of an amateur in this country, whose name it well bears. It is of dwarf trailing habit, producing a dense mass of large pure white flowers with puce-coloured eye, 1s. 6d. each.
TROPÆOLUM - Triomphe de Gand—a handsome variety for trellis work, producing large and brilliant scarlet flowers, 12s. per dozen.
CLEMATIS TUBULOSA MANGLESI, a handsome herbaceous plant bearing numerous heads of blue star-shaped flowers, very hardy, 9s. per dozen.
ROCKETS, new double crimson, 9s. per dozen; old double white, 3s. per dozen.
PRIMROSES, double white, 4s. per dozen; double crimson or maroon, 12s. do.; double yellow, 5s. do.; double purple, 4s. do.
PHLOXES.—The following choice varieties 9s. per dozen:—Maria Boulanger, Striata superba, Roi Leopold, Villaret joyeuse, Bois Rose, Imbricata, Macrantha, Deuil de la Comtesse de Marne, Anais, Eliza, Mrs. Thompson, Madame Courcelles, Madame Frobel, Madame Lanier, Madame de Pruines, Gen. Lamoricière, Princesse de Cleres, Princesse Marianne, and other fine kinds.
HOLLYHOCKS, extra fine, first-class show varieties by name, 12s. to 18s. per dozen.
BELGIAN DAISIES in 36 best kinds, by name, 4s. per doz.
PÆONIAS in 20 new and very choice Continental varieties, for 1l.
Dielytra spectabilis: this universal favourite, strong flowering plants, 9s. per dozen.
Delphinium Barlowi, 9s. per dozen.
" Mooreanum, an extremely beautiful variety, 12s. per doz.
" grandiflorum maximum, 9s. per dozen.
Saponaria ocymoides, 6s. per dozen.
Statice maritima rosea, a very pretty, hardy herbaceous plant of dwarf habit, producing numerous heads of bright rose-coloured flowers, 6s. per dozen.
MIMULUS in 6 new and choice varieties, 6s. per dozen.
POTENTILLAS in fine variety, 6s. per dozen.
Lilium lancifolium album, 9s. per dozen; rubrum, 20s. per dozen.
Lobelia Feu du Roi, St. Clair, and Aurora, 9s. per dozen.
Herbaceous Plants in very choice variety, 30s. per 100; or 6s. per dozen.
Alpine or Rock Plants, in choice variety, 4s. to 6s. per dozen.

YOUELL & Co., Royal Nursery, Great Yarmouth.

ROBERT PARKER begs to inform his friends and the public that his New Spring Catalogue containing Descriptive and Priced Lists of the following:—

Exotic Orchids
Ferns—stove, greenhouse, and hardy
Geraniums—show, fancy, scarlet, variegated, and hybrid bedding varieties
Chrysanthemums—large flowered, and Pompone varieties
Petunias
Antirrhinums
Roses in pots
Dahlias — show and fancy varieties
Fuchsias
Selaginillas or Lycopodiums
Gloxinias
Cinerarias
Calceolarias—bedding varieties
Verbenas
Miscellaneous bedding plants &c., &c.

Is now ready and can be had Post-free on application.
Paradise Nursery, Hornsey Road, Holloway, London.

NEW PLANTS.

MESSRS. WILLIAM ROLLISSON AND SONS are now prepared to offer—

BEGONIA SPLENDIDA.—This exquisite plant was discovered in Java by our collector, Mr. John Henshall, during his researches in the Indian Archipelago. It is an extremely beautiful plant of ornamental foliage, the stems and leaves of which are covered over with a bright crimson hirsute down: altogether it presents so striking an appearance, that it is alone much to be desired for its magnificent foliage, for which we are now offering it, the plant not having yet flowered in this country. 42s. to 63s.

RHODODENDRON GRISEWOODIANUM.—This is a most superb large white free-blooming variety, beautifully tinted with blush, and distinctly spotted with large dark brown spots; fine form and large truss, and possessing beautiful foliage. We have no hesitation in saying that this is one of the finest Rhododendrons ever raised, being perfectly hardy, which has been fully tested during the last two severe winters; for while many of the so-called hardy sorts were completely disfigured in their foliage, not a leaf of this variety was injured. 21s. to 31s. 6d.

RHODODENDRON SHAKSPEARE.—A soft rosy purple, intensely blotched with orange yellow on the top petals; a most beautiful and thoroughly hardy free late-flowering variety. 21s. to 31s. 6d.

ERICA ÆMULA.—This is a very beautiful hybrid, in the Erica Massoni section, of a fine bright crimson colour, after the style of Erica aristata, but very much higher in colour: altogether this is a very distinct variety. 21s.

ERICA EXIMIA SUPERBA.—This variety may really be said to be three times as fine as the parent, whose name it bears: it is a very compact grower and excellent in habit, with tubular blossoms of a fiery scarlet colour. This charming variety obtained the first seedling prize at the Royal Botanic Gardens, 1852. 31s. 6d.

ERICA PAXTONI.—A very distinct variety obtained by hybridising Erica Hartnelli with Erica Massoni; it blossoms in very large whorls of a soft red colour. This variety will be very useful for Autumnal Exhibition purposes, as it blossoms from July to October. 21s.

The set of the above-named Ericas, Three Guineas.

CALCEOLARIA VARIABILIS.—As a bedding plant this will make a charming variety, and in some measure supply the deficiency there has been for durable and effective plants of a light colour for the parterre. It is an excellent grower, of very compact, pretty habit, and produces in great profusion immense trusses of blossom, which open of a delicate primrose colour, and change to white. Altogether it is a most desirable acquisition, and a variety thoroughly distinct from any in cultivation. 10s. 6d. each.

NEW PRICED CATALOGUE OF PLANTS.

MESSRS. WILLIAM ROLLISSON will be happy to forward this on application. It can also be forwarded throughout the following countries, post free: America, Austria, Belgium, France, Germany, Holland, Prussia, &c. &c. This Catalogue abounds with novelties and rare plants; also contains priced lists of the following:—

The following Choice and New Plants can be seen in blossom at the Nurseries:—

AZALEA, EMPRESS EUGENIE.—This magnificent variety received a Bronze Medal, as a new plant, on the 9th inst., at the Royal Botanic Gardens, and will be sent out in the autumn at 21s. each. Early orders are respectfully requested, as they will be executed strictly in rotation.

Cattleya ianthina (new).

Odontoglossum hastilabium (rare).

Huntleya cerina.—This received a Silver Medal, as a new plant, on the 9th inst., at the Royal Botanic Gardens; also a First Class Certificate at the Horticultural Society's Rooms on the 8th inst.

Erica illustris (new); do. affinis (new); do. triumphans carnea (new).

Rhododendron Edgeworthi (Sikkim).—This received a Silver Medal, as a rare plant, on the 9th inst., at the Royal Botanic Gardens.

Dendrobium clavatum (rare); do Dalhousianum (rare).

Meyenia erecta.—This received a Silver Medal, as a new plant, on the 9th inst., at the Royal Botanic Gardens.

Lælia purpurata (rare).

Cymbidium species.—This received a Silver Medal, as a new plant, on the 9th inst., at the Royal Botanic Gardens.

The Nurseries, Tooting, London.

NEW AND CHEAP FIRST-RATE SHOW PLANTS.

The Cheapest Establishment in the Kingdom is at

HENRY WALTON'S, Florist, &c., Edge End, Marsden, near Burnley, Lancashire, where there are propagated annually for Sale from 20,000 to 30,000 Plants, which for cheapness and quality are not to be equalled, being strong and healthy.

GERANIUMS, strong blooming plants of varieties of last season, such as Carlos, Neatness, Glowworm, Regalia, &c. &c., 20s. per doz.; older good show varieties, 9s., 12s., and 15s. per doz. 25 for 20s.; 50 for 35s., packages included.

FUCHSIAS, new varieties of last season, 6s. to 9s. per doz.

CINERARIAS, choice varieties, such as Advance, Lord Vaise, Empress, Empress Eugenie, &c. &c., 10s. 6d. per doz. older varieties, 4s. 6d. per doz.

PANSIES, 12 distinct fine show varieties, 6s.; 25 varieties, 12s.

VERBENAS, new varieties of 1854, 4s. to 6s. per doz.

PETUNIAS, 4s. 6d. to 7s. 6d. per doz.

DAHLIAS, all the leading show varieties of last season, 9s. to 12s. per doz; older varieties, 4s. 6d. to 6s. per doz.

BEDDING PLANTS, including Scarlet and other Geraniums, Salvias, Pentstemons, Heliotropes, &c. &c., equally cheap.

H. W.'s Spring List is now ready, and may be had for one stamp. It is respectfully requested that all post-office orders be made payable at Marsden, Lancashire, and a remittance or satisfactory reference with all orders from unknown correspondents. All orders to the amount of 25s. paid to Liverpool, Manchester, Leeds, and Preston; 2l. and upwards free to Birmingham, Carlisle, and the like distances; for more distant carriage extra plants gratis.

N.B. Parties are particularly requested to see H. W.'s advertisement in *Chronicle* for April 14th and April 28th.

GERANIUMS.

BASS AND BROWN have the following to offer, strong and healthy plants, well established for a fine and abundant bloom. For descriptive list see their autumn Catalogue.

The following 12 *Superb New Show Varieties of last season for* 40s., *or separately as priced.*

Dobson's Eliza	3s. 6d.	Turner's Duchess of Wellington	5s. 6d.
" Empress ...	5 0	Topping's Emily Rival	3 6
" Glowworm ...	3 6	Hoyle's Regalia... ...	5 0
Foster's Lucy	5 0	" Virginia ...	5 0
" Purple Perfection	5 0	" Carlos	5 0

Goods carriage free (not under 20s.) to all the London and Norwich Carriers, and all stations on the London and Norwich Railway. Plants added gratis with orders of 40s. and upwards.

COMPLETE CATALOGUES on application for six penny stamps, or the Spring Catalogues alone for three penny stamps, or gratis to our customers who may not have received them.

Seed and Horticultural Establishment, Sudbury, Suffolk.

WILLIAM BARNES respectfully informs his friends and the public generally, that his SPRING CATALOGUE is now ready for distribution, and will be sent, post free upon application: it comprises all the leading varieties of Indian Azaleas, Cinerarias, Verbenas, Hollyhocks, Phloxes, Fancy Geraniums, Chrysanthemums, Perpetual Carnations, Liliums, Delphiniums, Antirrhinums, Petunias, Calceolarias, and a good collection of all the most popular plants in cultivation.
Camden Nursery, Camberwell, London.

J. CATTELL has much pleasure in informing the admirers of the Heliotrope that he will send out after the 12th of May a superb Seedling, named "HELIOTROPIUM JOHN CATTELL." The colour is a beautiful lively bluish purple, with a light lavender towards the bottom of the cup; the heads of flower stand erect, and are very large; the leaves are broad, and a good green, having none of the objectionable black colour of Voltaireanum and kindred varieties, while the scent and habit is superior to any other. From the size of the flowers, the bold manner in which the head is produced, together with the pleasing colour and excellent habit of the plant, J. C. is quite confident that this variety, when it becomes known, will supersede every other for general purposes. Strong Plants, post free, 7s. 6d. each. A liberal discount to the trade.
A remittance or reference in London must accompany orders from unknown correspondents.—Nurseries, Westerham, Kent.

NEW FUCHSIAS.

STEWART AND NEILSON are now receiving orders for their Twelve NEW FUCHSIAS, advertised in September last, which will be ready to send out on the 1st of May at the following prices, or 3*l.* for the twelve.

Mr. Ewart, dark	10*s.* 6*d.*	Mrs. E. Hill, light	7*s.* 6*d.*
Mr. D. Neilson, do.	10 0	Mrs. Gardner, dark	7 6
Mr. G. Lawrance, do.,	10 0	Miss A. J. Wright, do.	5 0
Miss France, do.	10 0	Mrs. Maxwell, do.	5 0
Mr. Littledale, do.	7 6	Mrs. Perry, do.	5 0
Dr. Parr, do.	7 6	Mrs. Bouch, light	5 0

A remittance from all unknown correspondents.
Nurseries, Liscard, Cheshire, near Liverpool.—May 12.

JOHN CATTELL has a plentiful supply of PLANTS of the following, autumn-sown and bedded, superior true sorts:

Cauliflower, early and late	4*s.* per 100
Broccoli, Cape (Grange's and Hammond's)	3*s.* "
Cabbage, Red	1*s.* 6*d.* "
" Early, of sorts	7*s.* per 1000
" Drumhead or Cattle	5*s.* "
Savoy, of sorts	5*s.* "

Packages containing Plants to the value of 1*l.* and upwards will be delivered carriage free to London, and to the Edenbridge Station of the South-Eastern Railway, package included. A remittance must accompany orders from unknown correspondents.
Nurseries, Westerham, Kent.

IMPORTED ITALIAN RYE-GRASS.

J. C. WHEELER & SON, GLOUCESTER,

Have some fine new Imported Italian Rye-Grass to offer at 6s. 6d. per bushel; or a bale, as Imported, containing about 14 bushels, for 84s.

CARRIAGE FREE.

J. C. WHEELER & SON, SEED-GROWERS, GLOUCESTER.

NEW AND BEAUTIFUL PLANTS.

MESSRS. VEITCH & SON,

OF EXETER, AND THE EXOTIC NURSERY, CHELSEA,

HAVE much pleasure and confidence in offering the following novelties. In making the present selection, Messrs. VEITCH & SON have been guided solely by the determination of submitting only such plants as are of general usefulness and sterling merit.

DESFONTANIA SPINOSA.—A fine hardy evergreen shrub with glossy Holly-like foliage, introduced from the Andes of Patagonia, by Mr. William Lobb, who discovered it in the region of snow. It produces beautiful tubular-shaped blossoms, often 2 inches in length, and of a rich scarlet colour, tipped with yellow. (See figure in Curtis's "Botanical Magazine," for May, 1854.) This plant, having been fully exposed in the open ground during the last severe winter, may now be considered perfectly hardy, and is certainly a great acquisition. Fine established plants, of two sizes, 21*s.* and 42*s.* each. One over on three to the trade.

DIPLADENIA ACUMINATA of HOOKER; *synonyme* DIPLADENIA MAGNIFICA of the "Florist."—This really beautiful Dipladenia was exhibited at Chiswick, at the July Meeting last year, and was awarded the large Silver Medal. Both as an exhibition plant, as well as one for general ornament to the stove, it is scarcely rivalled. (It is figured in Curtis's "Botanical Magazine," for January of the present year, and in the "Florist" for November, 1854.) Strong plants, 15*s.* each, with one over to the trade where three are taken.

BOLLONIA PTEROCLADON.—This pretty hardy shrub, is figured in the "Botanical Magazine" for January last. It was exhibited at Chiswick, at the July Meeting of last year, and received a Silver Medal. It is a dwarf compact habit, with dense dark green foliage, and abundance of pure white Epacris-like flowers, and is altogether a neat and desirable plant. Well established plants, 10*s.* 6*d.* each. One over on three to the trade.

EPACRIS ECLIPSE (STORY'S).—This is a striking flower, of fine habit, and great freeness of bloom; it was raised from Miniata grandiflora, crossed with a fine seedling. Strong plants, 10*s.* 6*d.* each. One over on three to the trade.

EURYBIA ALPINA.—This is a perfectly hardy evergreen shrub (from a high elevation in New Zealand), having stood without any protection the late severe winter. Strong plants, 10*s.* 6*d.* each. One over on three to the trade.

GRISELINIA LITTORALIS.—This is a perfectly hardy evergreen shrub with bright glossy green foliage, and fine habit. It has stood perfectly unharmed during the last severe winter, in situations where the ordinary evergreen shrubs were much injured. Strong plants, 15*s.*; second size, 10*s.* 6*d.* each. One over on the trade on three.

IXORA FLORIBUNDA.—A very neat plant, of dwarf compact habit, and a most abundant bloomer. It was sent from Java by Mr. Thomas Lobb, and is a very pretty plant. Strong bushy plants, 21*s.*; smaller, 10*s.* 6*d.* each. One over to the trade on three.

LAURUS AROMATICA.—A greenhouse plant, with delicately fragrant foliage. Good plants, 10*s.* 6*d.* each. One over to the trade on three.

MAYTENUS FERRUGINEA.—This fine evergreen shrub was sent from Chiloe and Patagonia by Mr. W. Lobb. It attains a height of from 6 to 8 feet, and is remarkable for its beautiful Holly-like foliage. As a fine leaved conservatory plant, it is perhaps without a rival, and no collection of fine foliaged plants should be without it. It has but to be seen to be admired. Fine established plants, of two sizes, 15*s.* to 21*s.* each. One over to the trade on three.

MYRTUS APICULATA.—A very pretty Myrtaceous plant, of the same degree of hardiness as the ordinary Myrtles; fine dark green foliage, and an abundant bloomer. Strong plants, 10*s.* 6*d.* each. One over to the trade on three.

MYRTUS BENTHAMIANA.—Having raised Seedlings of this fine plant, which is doubtless the finest of the long leaved Myrtle kinds, and which has proved to be perfectly hardy), we are now enabled to offer established plants in pots as follows: 10*s.* 6*d.*: for six, 50*s.*; for 12, 84*s.* Prices to the trade in proportion to the quantity taken.

PODOCARPUS NUBIGENA.—This is another perfectly hardy Taxaceous plant, sent from Patagonia, by Mr. W. Lobb. Established plants, 21*s.* each. One over to the trade on three.

RHODODENDRON CALIFORNICUM.—This is a distinct species sent from California by Mr. W. Lobb, and described as having the trusses of rose coloured flowers. It is perfectly hardy, has survived the past winter in the open border, without any protection whatever. The foliage is good, and it is an abundant bloomer, small seedling plants being now in flower buds. It is a late bloomer, and will doubtless be a valuable acquisition to hybridisers. It will be exhibited when in bloom. Strong well established plants, 10*s.* 6*d.* each. One over to the trade.

SONERILA MARGARITACEA.—This lovely plant was exhibited at the Horticultural Society's Rooms, 21, Regent Street, on the 7th of November last, and was the gem of the exhibition. (See report in *Gardeners' Chronicle*). It is perhaps the most chaste of all variegated plants, producing with dark glossy green leaves, dotted all over with silvery white spots, a profusion of beautiful crimson flowers, with yellow stamens. It is a dwarf compact plant, of particularly neat habit, and requires the temperature of a cool stove or warm greenhouse: (It is figured in the "Florist" for March last). Plants, 21*s.* each. One over on three to the trade.

SWAINSONIA LESSERTIFOLIA.—A very pretty shrubby Australian Papilionaceous plant, with spikes of flower resembling in colour Kennedya bimaculata. It is a free growing plant, and profuse bloomer. Strong plants, 7*s.* 6*d.* each. One over on three to the trade.

TORREYA MYRISTICA.—This is a splendid hardy Taxaceous plant, sent from California by Mr. W. Lobb. It is from the Sierra Nevada, at a high elevation, and attains the height of from 100 to 150 feet. The stock of this Plant is very limited. Strong Seedling Plants, 63*s.* each.

WELLINGTONIA GIGANTEA.—Ample description of this noble tree having appeared in former advertisements or circulars, it is only necessary now to say, that it is a Coniferous tree, of immense dimensions and great beauty. Having withstood the severity of the past winter, without injury, both at Chelsea and Exeter, there can be no doubt of its being a perfectly hardy tree. This is doubtless the most remarkable and interesting of recent introductions. A few of the first raised, extra sized plants, 42*s.*; second size, 31*s.* 6*d.*; third size, 21*s.* each. A deduction will be made on the above prices in proportion to the quantity taken.

Prices given to the trade on application.

Messrs. VEITCH & SON can also supply the following good and popular Plants:—

	Each.—*s.* *d.*		Each.—*s.* *d.*

Do. Storyi	10 6	Do. Dalhousiæ,	10*s.* 6*d.* to 21*s.*, to 42 0
Ceratostema longiflora,	7*s.* 6*d.* to 10 6	Do. argenteum,	10*s.* 6*d.* to 21 0
Crytomeria Lobbi,	7*s.* 6*d.* to 15 0	Do. Aucklandi	21*s.* to 42 0
Dipteracanthus spectabilis	3 6	Do. Edgeworthi,	10*s.* 6*d.* to 21 0
Dracæna indivisa,	21*s.* to 42 0	Do. Falconeri	10*s.* 6*d.* to 21 0
Echites Harrisi,	7*s.* 6*d.* to 10 6	Do. Niveum	3*s.* 6*d.* to 5 0
Eugenia Ugni,	2*s.* 6*d.*, 5*s.*, 7 6	Do. Nuttali, and many others	
Eucalyptus coccifera	21 0	Rhodoleia Championi,	3*s.* 6*d.* to 7 6
Fagus antarctica	10 6	Rubus japonicus	5 0
Fuchsia Dominiana,	3*s.* 6*d.* to 7 6	Thrysacanthus rutilans	10 6
Franciscea macrantha,	7*s.* 6*d.* to 10 6	Veronica variegata	2 6
Do. eximia	3*s.* 6*d.* to 5 0		
Do. confertiflora,	3*s.* 6*d.* to 5 0		

N.B. The prices of the Plants to which no quotations are affixed will be given on application.

EXOTIC NURSERIES, CHELSEA AND EXETER.—May, 1855.

TWO MAGNIFICENT NEW CALCEOLARIAS ADAPTED FOR BEDDING OR POT CULTURE.

"EMPEROR NAPOLEON AND EMPRESS EUGENIE."

YOUELL AND CO. have much pleasure in introducing the above beautiful varieties of this favourite flower, which they do with the greatest confidence of giving the most entire satisfaction. The following will be found a faithful description:—

EMPEROR NAPOLEON.—This is of a peculiar dwarf and compact habit, producing, on stout flower stems, dense heads of large orange-scarlet flowers, the outline of each being distinctly banded with a brilliant gold colour.

EMPRESS EUGENIE.—This, as the former, is of a dwarf but more robust habit, carrying, on extremely stout stems, an enormous head of rich, golden-coloured flowers, which, in point of size, are unequalled.

The foregoing possess the desirable properties of resisting the sun and rain without discolouring the bloom. The above are now ready for sending out at 7*s.* 6*d.* each, with the usual discount to the trade.—YOUELL & Co., Royal Nursery, Great Yarmouth.

NEW AZALEA—"ALBA MELIOR."

THIS is the one exhibited by us under the name of "ALBA MAGNA" among our collection to which the First Prize was awarded at the Regent's Park Show; very large pure white, and quite first-rate. Price 7*s.* 6*d.*, 10*s.* 6*d.* to 21*s.* each. Also a superior stock of Azaleas, for which see Catalogue.

The Spring Catalogue, consisting of Greenhouse and Stove Plants, and the Herbaceous one can be had by enclosing one postage stamp.

H. LANE & SON, The Nurseries, Great Berkhamsted.

BEDDING PLANTS.—AT 2*s.* 6*d.* PER DOZ.

JOHN SCOTT, Merriott Nurseries, Crewkerne, Somerset (established 1728), has nearly 20,000, in 3-inch pots, ready to be sent out. Post-office Orders payable at Crewkerne.

(Baskets and Package at the Expense of Purchaser, and not returnable.)

200 Sorts of the best and newest Verbenas.
120 do. Scarlet and other Bedding Geraniums.
20 do. Variegated leaved ditto.
100 do. Fuchsia, all the best; 24 do. Shrubby Calceolarias; 24 do. Petunias; with Anagallis, Ageratums, Cupheas, Heliotropes, Lobelias, Salvias, Senecios, &c. Also the beautiful white Double Pyrethrum.

When a fair proportion of each is taken the price will be 2*s.* 6*d.* per dozen; but if only Calceolarias and Geraniums are ordered they will be 4*s.* per dozen. Catalogues, in which the above are arranged in sections of colour, &c., sent on receipt of a postage stamp. Parties requiring large quantities can have them in store pots by agreement.

ORCHIDS.

WILLIAM MAULE AND SONS have received their annual importations of ORCHIDS from their collectors in the East, which they beg to offer on the following terms, many of which are one and two years established:—Vanda cærulea, 21*s.*, 42*s.*, 63*s.*, 105*s.*; Vanda teres, 10*s.* 6*d.*; Aerides odoratum, 10*s.* 6*d.*; Aerides affine, 42*s.*; Foxbrush, 105*s.*; Dendrobium Devonianum, 10*s.* 6*d.*; Cambridgeanum, 10*s.* 6*d.*; Gibsoni, 10*s.* 6*d.*; densiflorum, 10*s.* 6*d.*; Farmeri, 10*s.* 6*d.*, 15*s.* Chrysanthum majus, 7*s.* 6*d.*: nobile, mixed with Wallich 7*s.* 6*d.*; Pierardi, mixed with latifolium, 7*s.* 6*d.*; clavatum, 15*s.*, 21*s.* moschatum, 10*s.* 6*d.*; Camarotis purpurea, 10*s.* 6*d.*; Cœlogyne or Pleone, Wallichi, and maculata, in pots, with four or five plants or bulbs, 10*s.* 6*d.* each; Saccolabium ampullaceum (VERY scarce), small plants, 63*s.* each.—The Nurseries, Bristol.

PAGE AND CO'S COMPOSITION FOR THE DESTRUCTION OF BLIGHT UPON ROSES, WALL-FRUIT TREES, CUCUMBERS, MELONS, VINES, STOVE AND GREENHOUSE PLANTS.—Extra Strong, 4*s.* per gallon, sufficient to make four (Jars and Barrels extra). Directions for use forwarded. Ten gallons and upwards carriage free to London.

After four years' extensive use by the most eminent Gardener in the kingdom, the superiority of PAGE & Co.'s BLIGHT COMPOSITION is unquestionable, requiring only a trial to insure its general use for destroying every pest to which Plant and Fruit Growers are subject (without injuring the most delicate flowers or foliage) and promoting a luxuriant growth.

SATURDAY, MAY 12, 1855.

MEETINGS FOR THE ENSUING WEEK.

WEDNESDAY, May 16—Horticultural at Gore House, Kensington, 2 P.M.

THE long and excellent report upon the effect of the last winter upon the vegetation near Dublin, which we have lately published, led to some discussion, for which we have not before found room. The question raised was, in what manner does cold act upon plants when it causes death?

Dr. STEELE expressed his opinion that this was not properly understood. To the theory that death ensued from a too great distension of their tissues, caused by the congelation of their fluids, he objected.

On the contrary, he thought that the action was in some way similar to that caused by an electric shock on succulent plants, such as the garden Balsam. That a distension of the tissues did not produce injury, as generally supposed, was sufficiently shown by the well-known fact that the same degree of cold acted very differently on different plants placed in equal circumstances.

Mr. Moore did not consider the reasons given by Dr. Steele for objecting to the generally received opinion on this subject to have been happily conceived, inasmuch as animals which are natives of warm countries are more subject to be destroyed by cold than those which are natives of colder regions. Nature provides both plants and animals with tissues capable of resisting the rigours of the climates they were destined to live in. He had, therefore, no doubt but that the action was of a mechanical nature, and caused by the rupturing of the walls of the tender cells, which he believed was the opinion of the most distinguished botanists both in this country and on the continent of Europe. It was a very common occurrence to see the bark of plants that had been injured by frost part from the wood. Now, every vegetable physiologist knew that a layer of soft mucilaginous matter existed between the wood and bark of all exogenous trees, called cambium, out of which young cells were being formed, which had very long and slender walls at first, and it was known to be the congelation of that substance, and rupture of the tender cells, which causes bark to part from the wood. The chairman also had frequently remarked, when Pelargoniums are destroyed by frost, that the wood separates from the bark, and he believed the effect of frost on plants to be a mechanical action which ruptured their tissues, and not a sudden shock.

This is so interesting a question that we just venture to occupy a brief space with a remark or two which we hope may help to throw some light upon it.

That the action of frost is purely mechanical is an old doctrine which has met with general assent. It has been held that when a plant is frozen the fluids contained in its cells expand, and rupture the tissue, thus producing disorganisation. That this is to some extent true is, we believe, indisputable; some observers have reported that they have *seen* proofs of such an action. It has been therefore suggested that the fluids contained in different species of plants may themselves act differently in the presence of cold; just as oil of turpentine requires a temperature of 14° to freeze, while oil of bergamot freezes at 23°, and Olive oil at 36°. But although this may be true to a limited extent, yet it by no means explains the phenomenon in question. The plant *x*, for instance, perishes from frost, while another, identical with it in nature, lives with impunity within 2 yards of it, both having been exposed to the same temperature. In this case the fluids of the two will be chemically the same, and yet the results are opposite. Again, the Long-leaved Pine (P. longifolia) is quite tender, while the Gerard Pine, exceedingly like it, is hardy; in this case there is no ground for supposing that the fluids contained in these species are different. In fact, except that all plants suffer from cold in proportion to the quantity of water they contain, we have no kind of evidence to show that the quality of their fluids has any material influence upon their power of resisting cold; for it is by no means true, as some too hastily assert, that resinous trees, like Conifers, are rendered hardy by the resin they contain; the Norfolk Island Pine and the Malay Dammar are tender, although both are resinous.

It must be also remembered that plants are killed by cold although their cells are perfectly empty, in which case we need not say that the expansive force of frozen fluid would have nothing to operate upon.

All the experience that 40 years' acquaintance with such phenomena has given us leads to one, and only one, conclusion, which is that the power of resisting frost is the consequence of specific vitality and of nothing else.

That a low temperature, or frost, acts differently upon different plants very nearly allied to each other is notorious; and this even where they are mere varieties of each other. The China Rose, for instance, resists any amount of English cold; the variety called the Tea-scented perishes, or suffers severely, in every ordinary winter. The gay-flowered Senecios of the Canaries, known in gardens under the name of Cinerarias, shrink from the mere approach of frost, and perish upon its first arrival; yet the Ragworts, and Mugworts, and Groundsels, all equally Senecios, can bear a Russian winter. In like manner Oaks, Chesnuts, Conifers, exhibit similar differences in their power of resisting frost.

It is impossible, upon any other principle, to account for the facts that surround us. For example, Genista ætnensis has survived all the cold of this winter. What is there in its constitution, except specific vitality, which can account for the fact? — which can explain why it has endured, without suffering, a degree of cold that has proved fatal to its first cousin the Common Furze? Unhesitatingly we answer—nothing.

It may be asked, what *is* this "specific vitality?" To that we have no reply to give, except that we do not know.

It is an axiom in animal physiology, that "the general effect of cold on living bodies is a diminution of vital activity, which terminates, if the cold be intense, and its application continued, in death." (Pereira.) Hence it is to be inferred, that all living things whatsoever must finally perish beneath the influence of cold, provided it is severe enough and prolonged enough. But living things have each their separate constitutional vitality, the power of which in resisting cold differs between species and species, or variety and variety, and even between individual and individual. It is a peculiarity derived from the great source of all things; a reality; inexplicable but indisputable; like light, and heat, and electricity. We see it manifested among plants between the yellow and the spider Ophrys, and the Tea Rose and the China Rose; as among animals between the ass and the zebra, the Negro and the Esquimaux, the terrier and the Italian greyhound.

And we make this avowal of ignorance in the full conviction that it is the only way of meeting such inquiries. Men may speculate about first causes, and attempt to explain the inexplicable, but they only waste their own time and fatigue the patience of their readers.

It is by attempting to explain every phenomenon of life by the known laws of chemistry, electricity, and similar agencies, that we plunge into a labyrinth of perplexity—

"And find no end, in wandering mazes lost."

But the moment we admit the presence everywhere among all plants of a *vital principle*, and thus recognise a direct analogy between plants and animals, the principle of life in the two kingdoms being identical, but differently manifested, then we tread on the firm ground consolidated by the march of ages, and find in the experience of animal physiology the elucidation of what is obscure in that of vegetables. It is true that we then abandon the pursuit of first causes, and confess the vanity of that curiosity which nothing can satisfy; but we exchange rationalism for materialism, and we learn how to apply experience to daily uses.

Much of this reasoning is taken from the new edition of the "Theory of Horticulture," to which those are referred who seek for further information.

We understand that the Cattleyas from Brazil, advertised for sale by Mr. Stevens on Monday, are fine specimens of fine plants just imported. What is called C. Leopoldi in the sale catalogue is a very striking variety of C. guttata.

New Plants.

124. Vanda helvola. *Blume Rumphia* iv., *p.* 49. *Folia Orchidacea, no.* 14, *p.* 6 (*Vanda*).

We have received this rare plant from Mr. W. Pass, gardener at the Fence, near Macclesfield, who informs us that it is much shorter in the leaves, and has a dwarfer habit than any state of V. tricolor. We have not seen more than a couple of flowers, which by no means justify the reputation which the species has hitherto enjoyed. Dr. Blume calls it a magnificent species, with wine red flowers shading into pale purple and a brighter purple lip. What we have seen were of a dirty straw colour, tinged with a brownish violet over the upper half of the sepals and petals, while the *triangular* lip, although less yellow, was but little brighter or deeper in colour than the other parts. Perhaps more air and sun will hereafter improve their appearance.

VEGETABLE PATHOLOGY.—No. LXXI.

309. 4. Chlorosis of Orchids.—The very curious affection, of which a notice is now given, was kindly forwarded to me by Dr. Lindley without note or comment, except that the plant on which it was developed grew in a warm moist house, and rather dark. I have no further information from which the probable causes may be conjectured, nor can I assert whether it should be considered as purely constitutional or accidental. I must content myself, therefore, with describing what I have seen. It is the thick fleshy leaves of Phalænopsis amabilis on which it appears. The general aspect of the leaves is at first only very slightly affected; the green is full and of a healthy tint, but here and there pale ill-defined spots are observed, which might be hoped, in process of time, to assume their proper hue. But this is not the case; the cells of which they are composed are almost destitute of chlorophyll, or contain only a few grains reduced in size, and are probably of themselves incapable of performing their functions. In this stage possibly a solution of sulphate of iron might be used with effect, or at any rate would be worth the trial. Things, however, do not long remain in this state. The patches which were at first indefinite become tolerably well defined; and while the neighbouring cells increase and retain all their vivid green, these gradually contract and wither till the leaf is full of deep pits, the substance of which is at last dead and completely dry. No mycelium is found about them, though when submitted to pressure in order to their preservation in the herbarium these spots are peculiarly liable to generate moulds, while the parts which were full of chlorophyll exhibit this tendency in a far less degree. As contraction takes place certain granular points appear, but these are merely cells filled with abundant raphides and have nothing specially to do with the disease. On examination with the microscope the cuticular cells of the upper surface appear unaltered; their cytoblasts to the last are quite as full and perfect as in those parts which are sound: but several layers beneath the cuticular stratum exhibit a multitude of folds both vertical and horizontal, which are singular only for their regular parallelism, as far at least as we have observed, and it is owing to this probably that the surface of the spots is so even and free from distortion. The walls meanwhile are almost colourless, and their death takes place with no other effect than the gradual evanescence of all their fluid contents. As I have had no opportunity of examining the growing plant I am not able to say what proportion the pale spots on the leaves in an early stage of the disease bear to those which may exist at last, but from what takes place in drying I should conceive that the disease is not confined to those parts which were affected on the first development of the leaf, but that parts which were once rich in chlorophyll are liable to contract the disease, and wither equally with those in which it had never been perfectly developed. I have already suggested one remedy, and in similar cases I should feel inclined to try the effect of creating a steam from liquid manure poured upon the hot pipe, a practice which produces sometimes a very vigorous vegetation but which requires caution, as I have seen instances in which a stream of air from highly heated manure has been injurious to Pines. If the affection be strictly constitutional, little assistance from this or from any other measure can be expected, but in our ignorance of the limits between constitutional and accidental maladies it is well to try every scheme which reason or experience may suggest. Though at present my attention has been especially directed to the malady in one case only,* I believe that it is not unfrequent, and Orchids are often so valuable as to make the preservation of well-grown individuals a matter of considerable importance. They grow under such very different circumstances that it is almost impossible that all the epiphytous species should thrive in the warm damp shaded houses which are so favourable to so many of the species.† Some, so far from delighting in the shade, grow only in spots exposed to the full sun, as is the case with our own Liparis Lœselii and Malaxis paludosa, which make an approach to these epiphytes. As regards, however, the particular species before us, there is no reason to believe that it has any peculiar habits which would make it more impatient of such treatment than a thousand others. The figure represents a horizontal and vertical slice, the first of which on the left hand shows the pentagonal cells of the cuticle with their cytoblasts, and the plicate hexagonal cells beneath them; while the second shows portions of the four layers, all more or less plicate, which succeed the cuticle. *M. J. B.*

* A different affection, characterised by some remarkable features occurring on Aërides odoratum, Saccolabium Blumei, &c. will be noticed hereafter. The early stage is in some respects similar, but the cells contain chlorophyll grains, and ultimately assume a deep brown tint.

† The following passage from Hooker's Himalayan Journals, Vol. ii., p. 321, will illustrate this:—"Near the village of Lerwi Oak woods are passed in which Vanda cærulea grows in profusion, waving its panicles of azure flowers in the wind. As this beautiful Orchid is at present attracting great attention from its high price, beauty, and difficulty of culture, I shall point out how totally at variance with its native habits is the cultivation thought necessary for it in England. The dry grassy hills which it inhabits are elevated 3000 to 4000 feet: the trees are small, gnarled, and very sparingly leafy, so that the Vanda which grows on their limbs is fully exposed to sun, rain, and wind. There is no Moss or Lichen on the branches with the Vanda whose roots sprawl over the dry rough bark. The atmosphere is on the whole, humid, and extremely so during the rains, but there is no damp heat or stagnation of the air, and at the flowering season the temperature ranges between 60° and 80°, there is much sunshine, and both air and bark are dry during the day. In July and August, during the rains, the temperature is a little higher, but in winter it falls much lower, and hoar frost forms on the ground. Now this winter's cold, summer's heat, and extreme drought, and, above all, this constant free exposure to fresh air and the winds of heaven, are what of all things we are to expose our Orchids to in England. It is under these conditions, however, that all the finer Indian Orchideæ grow, of which we found Dendrobium Farmeri, Dalhousianum, Devonianum, &c. with Vanda cærulea, whilst the most beautiful species of Cymbidium, Bolbophyllum, and Cypripedium inhabit cool climates at elevations above 4000 feet in Khasia, and as high as 6000 to 7000 feet in Sikkim."

CHOROZEMAS.

Chorozemas are generally considered by amateurs difficult to cultivate; but they can be grown well by pursuing the following method. The soil should be a sandy peat, well broken with the spade, but not sifted. The best time for potting is March or April. Care must be taken not to over-pot the plants, or injure the roots while potting; the soil must be made very firm and compact about the roots, and the pots well drained; then they should be placed in the greenhouse in an airy situation, and not crowded among other plants. It is also well to keep them in the greenhouse during summer; but in hot weather they should be shaded for two or three hours each day during sunshine. They require a reasonable supply of water; that is, they must not be sodden, nor left too dry.

They may be propagated in the following manner: the cuttings should be taken off and carefully prepared while the wood is young; take off the bottom leaves with a sharp knife, and make a clean cut horizontally just through the joint; the cutting-pot should be drained, and then filled to within an inch of the top with the soil above mentioned; on the top of this put a layer of white sand, into which put the cuttings, making a hole for their reception with a small stick. When the pot is full, give them a little water with a fine rose; after which, place a clean glass over them: in this state they may be removed to the propagating house, where the temperature should be 70°. They should be shaded from the sun, which can be done by placing a sheet of coarse paper over the glasses.

As soon as the cuttings are rooted, which may be known by their appearance of growth, they must be potted off; but care must be taken not to injure the roots, and they must be shaded again for a week or ten days, until they make fresh ones; they must then be gradually hardened, and placed with the old plants in the greenhouse. *Alpha.*

COMMON THINGS.

Roses received from nurseries in May, and during the summer months, in a growing state, should, immediately after being unpacked, be placed in a cold frame, and if sunny weather, shaded a few days, syringing them occasionally, or giving them water from a pot with a fine rose. The first three days keep them close, afterwards admit air gradually, taking the lights off at night, if still weather and the nights are dewy. In eight or ten days they may be planted out without any risk of their being checked in their growth. Some little variation is required in the treatment of plants received out of pots, with their balls of earth enveloped in Moss; these, it need not be stated, have been grown in pots, but have been taken out for convenience of packing. If in spring or summer they should be placed in a cold frame, with the Moss tied round them, as they are received, treating them the same as if they were in pots; the Moss must be removed when they are planted out. Without these precautions Roses received in small pots on their own roots are very apt to die after being packed for perhaps a few days in a close basket.

To Stop the Bleeding of Vines.—When cut rather late in the season, take one-fourth of calcined oyster shells, beaten to fine powder in a mortar, and three-fourths of cheese, worked together until they form a sort of paste; this pressed into the pores of the wood, either with the thumb or by any other means, will effectually stop the flow of sap. Sometimes a repetition, however, is necessary if not well forced into the pores, or if the wound is not properly covered. Rubbing the cut parts well with candle grease also greatly assists in preventing Vines from bleeding.

Home Correspondence.

Osage Orange.—Perhaps it may prevent disappointment to experimenters in this part of the country to say that the Maclura grows no better here (Fifeshire), than Mr. Ayres finds it to do in South Wales. As is the case with many other American shrubs, the shoots of the Maclura are always killed back here to a half or a third of their length. In seed pans, indeed, in frames, the young plants grow freely enough, but when set out they make little progress, nor do plants from layers succeed any better. Some stools for layering which were planted here more than 20 years ago, throw up shoots 12 or 18 inches long, but these are invariably injured in winter. To form a good close hedge, a plant must be hardy enough to admit of being trimmed in summer, that is, it must be capable of ripening late growths, and this certainly the Maclura is unable to do in this climate. *W. S., Kirkaldy.*

Gooseberry Fly.—I have experienced little difficulty in capturing the flies which give existence to the Gooseberry caterpillar. It was on the 13th of April they first appeared here (at which time they were not at all lively, and were easily crushed), perched on some leaf, crawling up the stems of the Gooseberries, or on the ground. To make sure that none escaped observation, hidden by leaves or perched on the stems, some fine soil was cast sharply amongst the branches, which had the effect of either making the flies take to flight or knocking them upon the ground; on the latter they were easily crushed, and in the former case their place of rest was noted, if practicable, and they were destroyed. It was by these means that so many were killed during five or six days after the 13th of April. They gradually became thinner, and latterly I have been unable to find one. I attach importance to attending to their destruction early in the morning (say from 6 or 7 to 9 o'clock), because I found as the day advanced, and under the influence of a bright sun, that they became particularly vivacious and agile, and were then caught with difficulty. However, although I did not try it, I entertain no doubt that by means of a fine gauze net they might even then be readily captured. I may add that a considerable number of the male flies were caught also; I shall be putting the estimate low when I say fifty. *Robert Grey, Hadzor Gardens, Droitwich, May* 8.——Through the middle of April my men were engaged before breakfast in catching the sawflies that were nestled in the Gooseberry bushes, and sometimes got nearly a pint of them; they tapped the bushes with a stick, and the fly generally darted to the ground, where it was secured without difficulty. We adopted this plan some weeks before your Droitwich correspondent's account was published, and there cannot be a doubt that it is a very advantageous step to take. Those we killed were full of eggs, and had consequently done no harm, as they lay but once. I am informed a small black fly, which is met with on the bushes about the same time, feeds upon the eggs, and therefore should be encouraged. At present we have only observed one leaf affected with caterpillars in the whole of a large plantation. Should they appear, we shall have recourse to hand picking in the early stages, when the leaves are only eaten in pin-holes, as then they are found in numbers of 20 to 30 on one leaf. Those that escape this operation, and get distributed about the tree, we shall powder with hellebore, as we did last year with very marked success. Eighty pounds weight were used in successive dressings and sufficed to keep upwards of 100,000 young bushes so clean that not 100 were stripped of leaf, and this year they are in full strong leaf and form a striking contrast to those in the neighbouring plantations, where the ravages of the caterpillar were unchecked; many of those trees are dead, and a large portion of the remainder in a sickly state, with but little fruit that can arrive at perfection. Our Pear blossoms are much injured by the late frosts; the Black Currants are considerably affected; the Plum, Apple, Gooseberry, and Red Currant not materially hurt, but in some plantations the Plum is likely to suffer from grub, as it is already preying on the young leaves, but not visible without close inspection. *R. Varden, Seaford Grange.*

Camellias in Cornwall.—In the gardens of J. S. Bedford, Esq., of Pendrea, near Penzance, I noticed a splendid Camellia just coming into full bloom, and bearing upwards of 2000 buds and flowers, all fine and perfect. The size of the plant is 7 ft. high, 11 ft. in diameter, and 33 ft. in circumference. The gardener informed me that it has been in the open air throughout the past very severe winter; but a slight covering is now thrown over it, to protect it from the cold east wind and hoar frost. When planted in 1848 it was only a foot high. *Delta, Penzance, May* 4.

The Crimea.—As any anti-scorbutic is too valuable not to require notice, I beg to recommend the parties at Sebastopol to examine the rocks on the sea-shore, where I have little doubt the Crithmum maritimum will be found, as also at Scutari and other places in those latitudes. During many years' service in the Mediterranean I never failed to find it on the rocks, and made an invariable rule never to go to sea without a jar of it simply preserved in vinegar. It is a fine anti-scorbutic, and one of the very best pickles I know, and a most useful palliative to the salt pork and beef. There is little doubt our soldiers and sailors will be yet more accustomed to salt diet before they have done with that inhospitable shore, and any anti-scorbutic to be procured on the spot will be acceptable to them. *W.*——One of the Crimean scribes has found Dahlias! among the wild plants there. I dread the want of water for our troops if confined to the Heracleotic Chersonese in the summer. *S.*

Rapidity of Growth of Pinus insignis and Black Italian Poplar. — In the early part of the spring of 1852 I had a present made me of a Pinus insignis. It was about 7 feet in height, and in a pot; it was planted in a good soil, a loamy red sand, and sheltered by a plantation from the north. The spring following the leading shoot was 8 feet all but 1 inch; that is, the plant had gained that in height. The next year the growth did not exceed 4 feet, but lateral shoots were strongly sent out, some from 2 to 3 feet. This year an unfortunate occurrence took place, whereby numerous trees suffered, my Pinus amongst others—a fall of rain froze on the branches, to so great an extent as to load the trees with incrustation of crystals of ice, whereby they were torn and injured. One branch of the Pinus broke off, the leading shoot had been long upheld by a strong pole, the growth had been so rapid that my gardener was fearful of its breaking; about 5 feet, however remained unprotected, and this part was bent down by the ice, but not broken; it was braced up, but I have my apprehensions as to whether the leader will show much growth this summer; it is now 4 inches, and may perhaps reach 2 feet; here it is the earliest tree to shoot. Whilst on the subject, I will just give you the growth of a Black Italian Poplar—it was planted by me in the spring of 1821, being about 3 feet high; it was thrown down in February last, and found to contain 92 feet of timber, allowing for the bark; this increase was got in 34 years. *E. Jeffries Esdaile, Cothelstone House, near Taunton.*

Hybrid Rhododendrons.—I send you flowers of three varieties of hybrid Rhododendron:—No. 1, the largest, arboreo-catawbiense, is the one I referred to as equalling catawbiense in size and arboreum in colour. Nos. 2 and 3 are arboreo-maximum. All have stood this winter perfectly, in a very exposed situation. The flowers of No. 1 are not as large this year as last, owing to the plant, a large one, 8 feet high, having been moved last spring. All are free flowers, having this year from 30 to 40 heads, though only the second year of blooming; they are about 20 or 22 years old. *J. R.* [These flowers were exhibited at the meeting of the Horticultural Society on Tuesday last, as specimens of the hybrids to which our correspondent referred in his papers on Hybrid Rhododendrons in our columns a few weeks back. They were all high-coloured kinds, without the least blemish, and extremely handsome.]

The White Mediterranean Heath.—This being, I believe, the first instance of a white variety of the species ever discovered, it is consequently yet without a history, which is the following:—Three years ago, a gentleman from the county of Mayo sent me a specimen of the dark flowered variety, which I now enclose, having every appearance of the true Erica carnea, about which so much doubt existed relative to its being entitled to a place in the Irish Flora. Thinking I had obtained information likely to lead me near the locality of the plant, I started from Dublin for the county of Mayo in April, 1852, when after a long search I found the side of a hill covered with Erica mediterranea, all very dwarf and varying in tints and colour from the dark variety my friend sent me to the ordinary pink state. Finding that the case, I saw there was no chance of the true E. carnea being found, this being, no doubt, the plant taken for it; and, indeed, it is scarcely possible to find any essential characters which will distinguish this dwarf flesh-coloured variety from it. On seeing so many shades of colour, it at once occurred to me that, like our other native species of Heath, a white variety might be found, which resulted in the discovery of the original of the plant I now inclose, after searching two days. I shall hardly ever forget the effect produced by the ordinary state of this Heath on the hill where it grew in such profusion at that early period of the season, which can only be understood by those who have seen Erica cinerea covering a large space of ground in full bloom, lighted up by the rising or setting sun. *D. Moore, Glasnevin.*

Protecting Wall Trees.—The following is an account of the protection I used, and how I fared, during the severe frost of the 4th of May. My walls are 12 feet high; the outside course pitched ashlar'd stone; the inside, excellent brick, with a 6-inch cavity betwixt, and binders every fifth course and fifth brick, the coping projecting 5 inches, and throated 3½ inches from the wall. That portion of the south wall occupied by Apricots is covered every night with woollen sheets, nearly double the thickness of frigi domo, reaching from the top to within 6 inches of the ground at an angle of 16 inches from the wall; the sheets are fixed to rollers in 12 feet lengths, and can be let down or drawn up in a few minutes. Under such a covering you might imagine all is safe, but not so; on the morning of the 5th, when I went at 7 o'clock to draw up the sheets, a most beautiful crop of fruit, varying in size from a pea to that of a marble, was frozen quite black; consequently I let the cover remain down some hours longer, for fear of admitting the sun too suddenly, but all to no purpose; 99 out of every hundred are completely destroyed. I may also add that a Bigarreau Cherry on a different part of the same wall, which had a double hemp net and new Archangel mats hung before it, suffered equally with the Apricots. My own opinion is that no coverings such as are in present use will save fruit from the effects of such a night as the one just mentioned. *Thos. Henderson, Gardener to P. Garforth, Esq., Coniston, Yorkshire.*

Natural Mushrooms, Beurré Rance Pears, &c.—The Asparagus bed, from which I obtained a fine supply of Mushrooms in April (see p. 281), still continues to produce Mushrooms in great abundance, of the quality of which I send you a further illustration. I also send a dish of Beurré Rance Pears, instancing the excellent keeping properties of this Pear; and I may mention that the crop of Beurré Rance was saved last year by the employment of straw mats, which I use extensively. The two samples of kitchen Apples sent are much esteemed in this locality, viz., "Betty Geeson" and Normanton Wonder [Dumelow's Seedling]. They afford in themselves the best proof of their good keeping qualities. *W. Ingram, Belvoir Castle, Grantham, Lincolnshire, May* 7. [The above were all exhibited at the Horticultural Society's meeting last Tuesday. The Mushrooms were extraordinary specimens for this time of the year].——In the spring of last year four trenches were made 4 feet wide and 1 foot 6 inches deep. These were filled with some horse-dung direct from the stables, mixed with some old linings from frames (all horse-dung); these beds were planted with ridge Cucumbers in the usual way, but owing to a disease then prevalent among Cucumbers, they were useless. I therefore had them destroyed and the beds planted with Lettuces intermixed with Borecole. These still remain, and are a great protection to the beds. On the 27th of September we commenced gathering Mushrooms from these beds, and continued to have an abundant supply until the frost in January, which, owing to their not being protected, stopped their growth. During that time we had them in such quantities that many bottles of ketchup were made from the overgrown ones. They began to produce again on the 17th of April, and continue bearing as fine and good flavoured Mushrooms as I have ever seen grown in a regular Mushroom-house. I have now covered them with long litter, and keep

them regularly watered, and to all appearance they will continue in bearing for a considerable time to come. *John Morris, gardener to Thos. White, Esq., Wethersfield, Essex.*

The Manufacture of Caoutchouc, and its application to various useful purposes, were introduced by the late Mr. Charles Macintosh and myself, upwards of 30 years ago, and although the consumption was small at the beginning, it has grown now to a very large amount, and is constantly increasing by numerous new applications, both here and in other countries. The supply has hitherto been equal to the demand, but as the best quality is obtained from South America, and I believe from the Siphonia elastica, I beg to inquire whether this plant may not be cultivated in Jamaica and the East Indies, and if so whether attention should not be called to it in due time, since any chance that may obstruct the trade or diminish the supply, if obtainable only from one source, may cause great inconvenience. Before facilities were discovered for reducing the solid substance, many attempts were made to obtain it in the natural liquid state, as drawn from the tree, and in the year 1824 I succeeded in importing from Guatemala a considerable quantity in a very pure state, of about the colour and consistence of cream. I did not succeed in obtaining any more from that quarter, but I some time after employed a person at Tampico and that neighbourhood to collect it, and two or three hundred barrels of it were sent to me at a great expense, but it all became inspissated during the voyage, separating from a dark liquor, and taking the form of a portion of the barrel in a solid state. I have before me a sample in a perfectly fluid condition, of a much thinner consistence than the above, and which dries much more slowly; this has evidently been diluted with ammonia, to which, I presume, it owes the retention of its fluidity. I have mixed sulphur with this liquid, and when dried exposed it to heat in the ordinary process of vulcanising with perfect success. I also applied to it a solution of the chloride of sulphur, after the patent of Mr. Alexander Parkes, and the conversion was perfect, rendering the substance as insoluble and cold-resistent as if vulcanised. Now, it is clear that whether obtained in the solid or liquid state, this substance is destined to take an important place in the manufactures of this country, and this notice in your Paper might possibly be the means of directing the attention of competent persons to the cultivation of the plant. I some time ago mentioned the subject to Sir W. Hooker, who was so kind as to say that he would at any time render any assistance in his power to parties disposed to make the attempt. If you should wish to have a little of this liquid, I will send you enough to enable you to make any trial of it you may think proper. I have thought it would be useful for covering grafts or green wounds in plants or trees; in all cases when this substance is to be exposed to the atmosphere it should be blackened, or it is soon decomposed. *Thomas Hancock, Stoke Newington.* [We should be much obliged by a little of this liquid; but we do not see how it is to be procured except in tropical countries.]

One Boiler Plan of Heating.—The following are the advantages and disadvantages of heating whole ranges of houses by one boiler. Advantages—neatness and less labour in having only one fire to attend to. Disadvantages—high cost of large boilers; immense consumption of fuel in consequence of the great draught required; and dreadful sacrifice of plants should an accident happen to the boiler during severe weather, when such mishaps generally occur. *Kensingtoniensis.*

Seeds for the Crimea.—It may be interesting to know that our brave countrymen in the East have at least some among them who are anxious to contribute to their comfort and happiness. An order for seeds from a district being ravaged by war is somewhat novel; but such has been given by Captain the Hon. Henry Keppel, of H.M.S. St. Jean de Acre, through the Admiralty, to Messrs. Page and Co., Southampton, for a large supply of permanent Grasses and vegetable seeds sufficient to crop many acres of land. These were shipped in cases of about 4 or 5 cwt. each, on board the R.M.S.S. Medway, which left Southampton on Wednesday last, with Artillery horses and men. *Æstimo.*

The Weather.—On the night of May 2 one of my thermometers 6 feet from the ground fell to 26°, and on that of the 4th to 24°. On this latter night there were 3° of frost at 10 p.m. Such severity in the month of May is, I believe, unprecedented. The Apple blossom in this neighbourhood is fortunately not yet out, but the young shoots of the Lilacs and other shrubs appear many of them as if burnt up, and it will be impossible for some days to discover the extent of mischief done. The wind has now changed to the S.W., and it is to be hoped that we have seen the last of these unseasonable frosts; rain and mild nights are sadly wanted, as the Grass has scarcely began to spring, and the country looks as parched and dry as it usually does in March. *C. B. N. P., Knebworth, Stevenage, Herts, May 7.*—— The neighbourhood of London has again been visited by one of those severe spring frosts which seem now to be constant in their visitations. But the night of the 2d, when the thermometer at Chiswick registered 12° of frost, was more severe than any May frost on record. The blossoms of the Plum trees, although not open, are killed to a great extent; the petals are, however, white and the stamens perfect, but the germ is in nearly all cases black and dead. It will be of interest to know how far this severe frost extended; at Nottingham, as given in the *Times*, the thermometer did not descend below 28°. Formerly the environs of London were reckoned peculiarly favourable for fruit gardening, but for these last eight years the spring frosts have been ruinous to the fruit gardeners. *Pyrus.*

Foreign Correspondence.

Leaves from my Chinese Note-Book: No. IX.—The *Gardeners' Chronicle* reaches me pretty regularly upon the whole, although I sometimes get one month's numbers before the others, or two months' together, as the case may be; but whenever or wherever it comes to hand it is always most welcome. As I am in the habit of making notes upon any subject in its columns connected with the productions of China, I now send you some of these notes for the perusal of your readers.

Chinese Yam (*Dioscorea Batatas*).—This esculent seems to be attracting a good deal of notice in England as well as in France, and is apparently considered by some persons equal, if not superior, to the Potato itself. It is very abundant in China but is not a staple crop, like the sweet Potato, for example. Foreigners, as a body, prefer it when *roasted* to the sweet Potato; but do not dream of putting it on a par with the common Potato. However, I believe there is no vegetable of the kind at present known more likely than this is to take the place of our old favourite, providing it should die out or become so diseased as to render its cultivation uncertain and consequently unprofitable. In making this assertion, I am taking for granted that the climate of England is suitable for the production of the Chinese Yam, which I must confess I have some doubts about. I dare say it will prove hardy enough to withstand an English winter, but are *our summers hot enough?* or does not the want of summer heat account for Mr. Thompson's failure in the garden of the Horticultural Society? Experiments made in glass frames, or with bottom heat, or even in the open air in a summer which may be unusually warm, are all to be guarded against in deciding an important question of this kind. It ought to be kept in mind that the sweet Potato, the Arum esculentum, the Nelumbium speciosum, and such like plants, are cultivated as esculents in the north-eastern provinces of China, along with the Yam. But should the summers of England prove warm enough for its cultivation, I have no hesitation in saying that it is more likely to suit the tastes of the people than anything which has been brought forward since the commencement of the Potato disease.

Mosquito Tobacco.—Some amusing correspondence has appeared upon this subject which I cannot take as very complimentary to my last book, "A Journey to the Tea Countries," &c., or to the retentive memories of the readers thereof. Mr. Prideaux says (Sept. 9th), "In answer to 'R. A. H.' (see p. 565), respecting the passage referred to in Fortune's book on China, I have made the following note unfortunately without the reference. 'For keeping off mosquitos, the Chinese use the resinous saw-dust of the Juniper smeared upon Bamboo, which they find very efficacious.'" Dr. Hooker states "he has somewhere read or heard of the plant in question being a species of Artemisia." The following passage quoted from the book in question will assist the memories of both correspondents, although it will not add much to our information. "Various substances are employed by the Chinese to drive away mosquitos. This which we had just purchased was made from the sawings of resinous woods—I believe procured from Juniper trees—and mixed with some combustible matter to make it burn. A piece of split Bamboo, 3 or 4 feet in length, is then covered all over with this substance. When finished it is as thick as a rattan or small cane. . . . . Various species of wormwood are likewise employed for the same purpose."* Since my arrival in China on this occasion I have been making further inquiries about this curious substance, but have been met with considerable jealousy on the part of the Chinese. One manufacturer more communicative than his neighbours gave me a good deal of information as to the substances employed, but when pressed as to the proportions of each, suddenly changed his tone, and coolly told me he knew nothing about it, that if I wanted to buy it he would supply me with any quantity, that it was cheap enough, and what could I want more. Patience is a *great* virtue in China, and if I can only exercise it, perhaps I may tell you something more by-and-bye about Mosquito Tobacco.

Hardiness of Chinese Plants in England.—I have read with great interest the remarks published from time to time upon the effects of the severe winter of 1853-54 on Chinese plants of late introduction. Such plants as Weigela rosea, Jasminum nudiflorum, Forsythia viridissima, &c, I have always considered as perfectly hardy and suited for our climate, but I confess I was not so sanguine with regard to Cephatolaxus Fortuni, which appears to have proved itself as hardy as any of them. This is a great matter, considering the beauty of both varieties of this Chinese Yew. The Chusan Hemp Palm too seems to have established its claim as a hardy Palm at last. I have long thought that the species might produce the same marked effect upon our scenery as it does in that of the north-eastern province of China, more particularly in the southern counties of England and Ireland, and in the mild climate of Edinburgh. The new Chinese Berberries, in the class to which Berberis Bealei belongs, are no doubt perfectly hardy; they are much more so than Berberis Fortuni. The latter was much injured by the winter of 1852 53 at Shanghai, while the former stood perfectly unscathed. The Hollies I. furcata and cornuta are no doubt as hardy as our common English one. I do not observe it stated how Abies jezoensis stood the winter in England; at Shanghae it did not suffer in the least. This species was discovered on the mountains near Foo-chow in Fokien, but I fancy, from its apparent hardiness, it must have been introduced from Japan. "Dielytra spectabilis requires no further trial;" so says Dr. Lindley in a leading article. This was a great acquisition, and almost worth a journey to China itself. I can hardly credit my eyesight when I read that the Assam tea plant is hardy; is there not some mistake here? [No.] It is a fact worth noticing that while the winter of 1853-54 was a most severe one in Europe, it was particularly mild on the eastern side of Asia. Ice was scarcely formed on the lakes and canals about Shanghae and Ningpo, and all last summer the Chinese were dependent on that which had been housed in 1852-53, and which the plain ice-houses (described in the *Gardeners' Chronicle* for 1845) keep so well. *R. F.*

* "A Journey to the Tea Countries of China and India," p. 179.

Societies.

Horticultural, *May* 8.—J. M. Strachan, Esq., in the chair. The Hon. J. K. Howard, W. Dent, Esq., C. Hulse, Esq., F. C. Chatfield, Esq., J. Leeson, Esq., J. Wicks, Esq., A. F. Paxton, Esq., and Mr. J. Shaw were elected Fellows. There was an excellent exhibition on this occasion, the whole of the rooms belonging to the Society, and even the passages, being again crowded with plants, &c. The most striking objects were the Chinese Azaleas, immense bushes of which, loaded with flowers, came from Mr. Grix, gr. to A. Palmer, Esq., of Cheam. The sorts were Bianca, Falconeri, and lateritia. The same grower also exhibited a large plant of A. magna as a single specimen. Other Azaleas were furnished by Mr. Todman, gr. to Mrs. Buckmaster, and Messrs. Gaines, Rollisson, and Chandler. Among these the best were Perryana, Duke of Devonshire, Iveryana, and alba magna. In addition to the above, Mr. Frost, of Dropmore, had six seedling varieties, all promising kinds; Messrs. Standish and Noble boxfuls of small plants of the white semi-double A. narcissiflora, an example of A. amœna, crowded with small purple flowers, and A. Beallii, a beautiful kind with white blossoms striped and spotted with rosy salmon. These last three were introduced by Mr. Fortune. Messrs. Veitch sent two very fine pyramidal specimens of A. indica alba, and Messrs. E. G. Henderson a pretty kind—salmon edged with white—called Beauty of Europe. Pelargoniums, both fancy and other kinds, were exhibited by J. Allnutt, Esq., of Clapham, Mrs. Buckmaster's gardener, and by Messrs. Dobson and Turner. Mr. Dobson's plants, all of which were large and well bloomed, consisted of Eugenie, delicatum, Harriet, Rosamond, Arethusa, and Vulcan. Mr. Turner had Governor-General, a brilliant variety; Petrichio, Brilliant, Pandora, Lucy, and Rosamond. These, although in less than 6-inch pots, were finely grown and remarkable for the size and substantial texture of their flowers. The last-named exhibitor likewise showed a collection of Pansies in pots, as did also Messrs. Dobson and Bragg. The more striking sorts in these groups were Uncle Tom, Great Western, Emperor, Satisfaction, Comet, Duke of Perth, Earl of Mansfield, Ophir, Sovereign, British Queen, Grand Duke, Sir Joseph Paxton, Mr. Beck, Robert Burns, Fearless, Grace Darling, and Lady Carrington. Some well grown Auriculas and Cinerarias were shown by Mr. Turner and Mr. Wiggins, gr. to Mr. Beck; as the names of the leading sorts of these flowers, however, are given in another column, we need not occupy space with them here.

Of Rare Plants, Messrs. Rollisson had the handsome yellow, brown-streaked Huntleya cerina, and the curious Dendrobium Cymbidioides; Messrs. Veitch the pretty Rhododendron Prince Camille de Rohan; Messrs. E. G. Henderson R. Dalhousieanum badly coloured; Begonia picta, a sort with handsome leaves; and Genetyllis (Hederoma) macrostegia, a greenhouse shrub, with drooping crimson, bell-shaped flowers. The most remarkable plant exhibited, however, was Genetyllis tulipifera, of which there were two examples from Messrs. Backhouse, of York. This species very much resembles an Epacris in all but the blossoms, which are as large as those of the Canterbury Bell, and white or rather pale lemon streaked with bright red. The effect produced by flowers of such size and colours, when the latter are well brought out, as they were in this instance, may therefore be well conceived. The same firm also sent Cattleya ianthina, a small flowered variety of C. intermedia.

Of Miscellaneous Greenhouse Plants, Messrs. Henderson, of Pine-apple Place, had a collection, in which were six Eriostemons beautifully flowered; Elæocarpus reticulatus, and the Blue Trimandra ericifolia. Mr. Maher, gr. to J. M. Strachan, Esq., had an example of one of the best varieties of Cattleya Mossiæ, Mr. Todman a large Erica ventricosa grandiflora, Mr. Cutbush a noble specimen of the Canary Island Statice Holfordii, and Messrs. Standish and Noble Rhododendron glaucum, and Weinmannia tricosperma, an evergreen shrub which has not yet blossomed in this country, but which, even independent of its flowers, must always be prized for the beauty of its foliage. The sweet-scented Sikkim Rhododendron Edgeworthii came from Mr. Whitbread, gr. to C. B. Warner, Esq.; Messrs. E. G. Henderson sent some seedling Heaths and Deutzia gracilis in the form of Standards. Mr. Allnutt produced a remarkably fine specimen of Hovea Celsi, furnished with branches and flowers quite down to the pot.

Of Fruit, Mr. Robinson, gr. to Lord Boston, sent a Providence Pine-apple weighing 7 lbs.; Mr. Fleming, gr. to the Duke of Sutherland, a Moscow Queen, weighing 3 lbs. 4 oz.; and Mr. M'Ewen, gr. to the Duke of Norfolk at Arundel Castle, a Ripley Queen, weighing 2 lbs. 10 oz. Mr. Fleming furnished, moreover, a hybrid white-fleshed Melon, a small yellow skinned variety, said to be of great excellence. Black Hamburgh Grapes, large both in bunch and berry and well coloured, came from Mr. Clements of East Barnet; the Duke of Sutherland's gr. likewise sent good fruit of the same variety; as did also Mr. Mitchell, of Brighton; Black Hamburghs also came from the Duke of Norfolk's garden; from Mr. Munro, gr. to Mrs. Oddie, who also sent good bunches, but unripe, of White Frontignan; from Mr. Hughes, gr. to J. Eaton, Esq.; and from Mr. Hill, gr. at Keele Hall, Staffordshire; the last-named exhibitor also had Black Prince; and three bunches of West's St. Peter's came from Mr. Allport, gr. at Doddington Park. Other fruit consisted of Falstaff Raspberries and Alice Maude Strawberries from the Duke of Norfolk's garden; Keen's seedling Strawberries, from Mr. Taylor, gr. to W. Wood, Esq.; British Queen Strawberries from Mr. Mathew of Dulwich Common; Figs from Doddington Park; "Betty Geeson" and Normanton Wonder, dates Dumelow's Seedling or Wellington Apples, in excellent preservation, and remarkably fine specimens of Beurré Rance Pears from Mr. Ingram, gr. to the Duke of Rutland; also beautiful examples of the same kind of Pear from Mr. Tillyard, gr. to the Rt. Honourable the Speaker; and Easter Beurré Pears, very much decayed, from J. Abell, Esq., of Limerick.

The last-named gentleman likewise sent, as promised last week, see p. 303, some Asparagus (what is termed in the London markets Sprue), frosted and unfrosted, the one quite as good as the other, and along with it 50 heads of ordinary Asparagus, weighing 2 lbs. 5 oz. The Duke of Norfolk's gardener had also 50 heads, weighing 2 lbs. 4 oz., together with six beautiful heads of Broccoli, and a collection of vegetables in which were Kidney Beans, Ash-leaved Kidney Potatoes, and Peas, superior examples of the same kinds of vegetables furnished from France

by Mr. Lewis Solomon. Other French produce from Mr. Solomon consisted of Early Horn Carrots, Globe Artichokes, and 100 heads of very large White Asparagus. From the garden of Mr. Wood came well grown specimens of Taylor's Hybrid and Essex Hero Cucumbers, and Mr. Stearns furnished a dish of very good Mushrooms.

Among Miscellaneous articles was a new self-registering thermometer, from E. Vivian, Esq., of Torquay. Of this some account will be given hereafter. Mrs. Compton, of Collier's Buildings, Blackheath, again furnished specimens of ornamental Indian baskets: Mr. Fred. Rowe showed imported examples of Sago in the shape of straight shoots, some 8 or 10 feet in length, thickly set with long spines, together with other American curiosities, such as dried fruit of the American Date, from which a kind of wine is prepared; a branch of a species of Smilax; seed pods of a Robinia; stalks of Hibiscus esculentus, whose green seed pods are used for thickening soups, and red seed of Burning Bush, Euonymus sp., probably atro-purpureus.

From the garden of the Society came the singularly-shaped Calceolaria violacea, Rhododendron theæflorum, Edgeworthi, and formosum, the double white Prunus sinensis, a useful shrub for forcing; the scarlet-flowered Salvia gesneriflora, one of the most brilliant of plants; the charmingly flowered specimen of Forsythia viridissima alluded to last week, Dielytra spectabilis, and other fine flowering plants.

The list of medals, &c., awarded on the occasion will be found in our advertising columns.

Royal Botanic, Regent's Park, *May* 9.—Although fewer plants were produced on this occasion than usual, yet, upon the whole, there was a fair average show. Her Majesty, his Royal Highness Prince Albert, and other members of the Royal family, honoured the Society with their presence in the morning before the gates were opened to the public. The weather, although cold and somewhat cloudy, kept dry.

Large collections of Stove and Greenhouse Plants were contributed by Mr. May, gr. to H. Colyer, Esq.; Mr. Barter, gr. to H. Bassett, Esq.; Mr. Green, gr. to Sir E. Antrobus, Bart.; and Mr. Rhodes, gr. to J. Phillpots, Esq., of Stamford Hill. In Mr. Colyer's group were immense plants of Epacris grandiflora, Eriostemon neriifolium, Boronia pinnata and serrulata; Ixora crocata, Azalea Murrayana and variegata; Ixora javanica, Vincas, Leschenaultia formosa, Erica elegans, one of the finest plants of the kind perhaps ever seen; Aphelexis macrantha purpurea, Pimelea spectabilis, Chorozema Henchmanni, and Polygala oppositifolia. Mr. Barter also had an admirable collection, in which were fine plants of Ixora javanica and crocata, Eriostemon intermedium, Stephanotis floribunda, Chorozema Lawrenceanum, Polygala acuminata, Azalea Perryana, still one of the best varieties in cultivation; A. coronata, Erica Cavendishi, a fine plant, but insufficiently in bloom; the blue Leschenaultia, Boronia pinnata, Pimelea Hendersoni, very highly coloured; the sweet-smelling Franciscea confertiflora, and a Vinca. Mr. Green sent an immense double red Azalea, Polygala acuminata, Ixora coccinea, Eriostemon intermedium, Ixora crocata, Aphelexis macrantha purpurea, Azalea Iveryana, literally one mass of white blossoms in which were faint stripes of purple; Pimelea spectabilis, P. Hendersoni, Franciscea confertiflora, Leschenaultia formosa, Chorozema Lawrenceanum, Daviesia umbellata, some Cape Heaths, and Epacris miniata. Mr. Rhodes produced Acrophyllum gracile, a useful plant for cutting from for bouquets: the rose-coloured Vinca, an Everlasting, Epacris grandiflora, some Cape Heaths, Boronia serrulata, Eriostemon neriifolium, Stephanotis floribunda, Tetratheca verticillata, Leschenaultia formosa, Polygala acuminata, and Chorozema Lawrenceanum.

Stove and Greenhouse Plants in collections of 12 were exhibited by Messrs. Fraser, Rollisson, Cutbush, Henderson, and Pamplin. Messrs. Fraser sent a huge Pimelea spectabilis, Epacris grandiflora, Leschenaultia formosa, Erica propendens, Eriostemon neriifolium, the more slender E. scabrum, Boronia serrulata, Azalea optima, a glowing red kind; Adenandra speciosa, Aphelexis spectabilis, a fine bush of Boronia tetrandra, and another of the large yellow-flowered Gompholobium barbigerum. Messrs. Rollisson showed Erica Sindryana, an erect-growing free-flowering kind; the sweet-smelling Rhynchospermum jasminoides, Azalea speciosissima and Perryana, Erica propendens, two Everlastings, Eriostemon neriifolium and myrtoides, a variety of Epacris miniata called splendens, a brilliant kind, E. grandiflora, and Pimelea spectabilis. Mr. Cutbush furnished the same Statice Holfordi mentioned already in our report of the Horticultural Society's meeting; a good Stephanotis floribunda, Erica elegans and Hartnelli, both fine plants; Boronia pinnata and serrulata, Leschenaultia formosa, Azalea Exquisite, an Everlasting, the pretty, though rarely seen, pink-flowered Hypocalymma robustum, and Eriostemon scabrum. In the two groups from Messrs. Henderson and Pamplin we remarked Allamanda neriifolia suffering from cold, Medinilla magnifica, a very fine plant of Rhynchospermum jasminoides, Ixora racemosus, a well-grown Hovea Celsi, a large Pimelea spectabilis, and some Azaleas, Boronias, and Cape Heaths.

Collections of 10 Stove and Greenhouse Plants were shown by Messrs. Clarke, Taylor, Dingle, Peed, Hamp, and Morris. Mr. Clarke sent Tetratheca verticillata, Adenandra speciosa, Ixora coccinea, a pyramidal White Azalea, Gompholobium barbigerum (very fine grown and well flowered), Pimelea spectabilis, and a fine specimen Chorozema Dicksoni, a plant now rarely seen. In Mr. Taylor's group were Azaleas, Ixora crocata, Aphelexis sesamoides, Eriostemon intermedium, Erica elegans, two Boronias, and some Cape Heaths. Mr. Dingle had an immense red Azalea, some Eriostemons, the useful Acrophyllum venosum, Azalea Amœna, Franciscea calycina, Pimelea mirabilis, and Leschenaultia formosa. In the collections of Messrs. Peed, Hamp, and Morris, we observed good plants of Gardenia florida, Allamanda neriifolia, Euphorbia splendens, Bossiæa cordata, Erica Sindryana, Eriostemon intermedium, Hovea Celsi, and Cyrtoceras reticulatum.

Of Chinese Azaleas some were in the form of ordinary bushes, others in that of tall standards and pyramids, the whole producing an effect at once striking and beautiful. Groups of 10 plants came from Messrs. Fraser, Lane, and Green; and collections of eight and six from Messrs. Roser, Dingle, Peed, Bray, Barter, Fraser, and Rhodes. Among the different groups were Iveryana and its varieties, Gledstanesi, Semiduplex maculata, Exquisite, Minerva, variegata, optima, Frosti, carnea grandiflora, Iveryana, delicata, Susana, Napoleon, Prince Albert, Excellence, &c. Messrs. Rollisson had a new finely-shaped pink kind, called Empress Eugenie, which was much admired.

Hybrid Rhododendrons were confined to a small collection of Mr. Gaines, all delicate pink-coloured kinds.

The Cacti came from Mr. Green, in whose group was a white Echinopsis called grandiflorum, an interesting variety, which formed a fine contrast with the more common scarlet sorts.

Orchids.—Collections of 20 plants were contributed by Mr. Williams, gr. to C. B. Warner, Esq., Mr. Woolley, gr. to H. B. Ker, Esq., and Mr. Hume, gr. to R. Hanbury, Esq., the Poles, Gunnersbury. In the first group were Dendrobium densiflorum, chrysotoxum, and nobile; Vanda suavis with two noble spikes of flower, V. teres, V. tricolor, and V. insignis; also Phalænopsis grandiflora, Phaius Wallichi, Oncidium ampliatum, Aerides, the white Calanthe veratrifolia, Cattleya intermedia and Mossiæ; three varieties of Aerides, Chysis bractescens, Cypripedium barbatum, and Lycaste Skinneri, the latter with 17 flowers on it. Mr. Woolley sent Epidendrum crassifolium and ciliare, Oncidium sphacelatum, Dendrobium nobile, macrochyum, and Paxtoni; Vanda tricolor and insignis, Cattleya intermedia and Mossiæ, Lycaste Skinneri, Lælia flava with four spikes of flowers on it, Chysis bractescens, Phalænopsis grandiflora, Scuticaria Steeli with three large yellow-spotted blossoms, Calanthe veratrifolia, and two sorts of Aerides. Mr. Hume produced Dendrobium Farmeri and densiflorum, a fine plant of Epidendrum ciliare, Cattleya Mossiæ, Oncidium leucochilum, and altissimum, Vanda tricolor, Phalænopsis grandiflora, a fine plant of Saccolabium guttatum, plants of Cattleya ianthina, and Skinneri in lovely condition, Brassia verrucosa, finely grown and well flowered, Oncidium Hartwegi, Chysis bractescens, the rare ivory white Cymbidium eburneum, and one or two other plants.

In the class of 16 Orchids Messrs. Rollisson sent Phaius Wallichi, a noble plant with 10 spikes of flowers; Dendrobium nobile and chrysotoxum, Vanda suavis, Cypripedium Lowi, with four of its singular blossoms fully expanded; Leptotes bicolor, Cattleya purpurata, an extremely handsome species, white, with a purple lip; Trichopilia coccinea, Phalænopsis grandiflora, and the bearded Lady's Slipper.

Collections of 12 Orchids were contributed by Messrs. Gedney, Clarke, and Summerfield, and Mr. Green produced a group of 8 Orchids. Among Mr. Gedney's plants, which were in beautiful condition, were Lycaste Skinneri, bearing 15 flowers, Vanda tricolor, the Fernando Po Ansellia africana, Calanthe veratrifolia, Dendrobium nobile, Saccolabium retusum, with four charming racemes of flowers; Phalænopsis grandiflora, the brilliant orange Epidendrum rhizophorum, Vanda insignis, Oncidium ampliatum, and Aerides virens. Mr. Clarke produced a fine specimen of Cattleya Mossiæ, also C. Skinneri and intermedia, Phaius grandifolius, Saccolabium retusum, Goodyera discolor, well flowered; and Dendrobium nobile. In the other two groups were Cattleya Mossiæ and Skinneri, the Devonshire and Dalhousie Dendrobes, Cyrtochilum stellatum, two Oncids, and Epidendrum crassifolium.

Roses in Pots were produced in very good order, considering the unfavourable season we have had. Mr. Francis showed an excellent collection, in which were Géant des Batailles, Baronne Prevost, Paul Perras, with 80 blooms on it; Pauline Plantier, with 50; Bougere, with 30; Devoniensis, with 24; Souvenir de Malmaison, with 27; Chenédolé finely coloured; and Coupe de Hebe, with 30 blooms. Messrs. Barter, Sage, Terry, and Ward also had clean well bloomed plants.

Cape Heaths came from Messrs. Fraser, Rollisson, May, Peed, Barter, Dingle, Taylor, and Roser. Among these we remarked the following varieties: pinifolia rosea, a kind seldom seen; viridis (true), also a scarce sort; Sindryana, elegans, vestita alba, mundula, aristata major, Cavendishi, denticulata moschata, favoides elegans, Hartnelli, Macnabiana, perspicua nana, suaveolens, propendens, and Beaumonti.

Of novelty there was little. In addition to the plants shown to the Horticultural Society last Tuesday, Messrs. Rollisson sent Meyenia erecta, a greenhouse shrub with Tyrian purple flowers something like those of an Achimenes. They were in this instance, however, quite withered by the cold; the same nurserymen also sent a Cymbidium in the way of C. pendulum; Messrs. Henderson produced Rhododendron glaucum; and Messrs. Lane Andromeda formosa.

Among Miscellaneous Plants were some Ferns, a collection of Amaryllises, apparently varieties of A. Johnsoni, and a Standard parasol-shaped Fuchsia.

Florist's Flowers, considering the lateness of the season, were shown extensively, and in fine condition. They comprised Pelargoniums, Auriculas, Cinerarias, and Pansies.

Pelargoniums.—Of these Mr. Turner, of the Royal Nursery, Slough, furnished 12 of the best plants we ever remember to have seen; they consisted of the following kinds—Governor-General, Carlos, Lucy, Basilisk, Rosamond, Majestic, Mochanna, Exactum, Rival Queen, Clara, and Petruchio. In the Class of Private Growers, Mr. Windsor, gr. to A. Bligh, Esq., Hampstead, produced old varieties tolerably well grown, but not in good bloom.

Of Fancy Pelargoniums there were seven collections scarcely sufficiently in flower. Here again the best group came from Mr. Turner; it comprised Madame, Delicatum, Gaiety, Formosissimum, Caliban, and Electra. In the Class of Private Growers Mr. Windsor sent Fairy Queen, Magnificent, Duchess d'Aumale, Statinski, John Bull, and Madame Miellez.

Cinerarias were numerous. The best group came from Mr. C. Turner, who sent large dwarf plants of the following—Bousie, Optima, Esther, Loneliness, Sir C. Napier, Lady Paxton, and Picturata.

Of Pansies, in pots, Mr. C. Turner contributed Brilliant, British Queen, Uncle Tom, Monarch, Aurora, Ophir, Lord J. Russell, Marchioness of Bath, Satisfaction, Sovereign, Purple Perfection, and Emperor. Cut Blooms 36 varieties: 1st, Mr. C. Turner; 2d, Mr. Dobson. Among these the best kinds were Perfection, Monarch, Royal Albert, Comet, Sampson, Satisfaction, Nonpareil, Beauty, Sir J. Cathcart, Purple Perfection, Queen of the Isles, Primrose Perfection, Mrs. Marnock, Salamander, Earl Mansfield, and Royal Visit. The Pansies, generally, were very fine.

Mr. Gaines had six Herbaceous Calceolarias; and Mr. C. Turner a collection of 30 Auriculas. The best of these were Lancashire Hero, Oxonian, Bolivar, Ringleader, Lovely Ann, Superb, Attraction, Ne Plus Ultra, Venus, Lady Jane Grey, Smiling Beauty, Duke of Cambridge, and Conspicua.

Mr. Gaines exhibited a collection of Mimulus, both in cut state and in pots, some of which were very prettily marked.

We also observed a rich yellow ground Pansy, named Perfection. This we have before described. It was again fine, as were also Sir W. Scott, Admiral Napier, and Crimson Perfection, all yellow ground varieties, and Sir C. Campbell, a very large dark variety.

Garden Memoranda.

Messrs. Veitch's Nursery, King's Road, Chelsea.—Since we last visited this establishment considerable improvements have been carried out. The wings of the large conservatory near the entrance have recently been heated with hot water, and separated from the central portion of the house by means of folding doors. One of the parts thus partitioned off contained tree and other tender Ferns, Sarracenias, &c., and among them was a very fine specimen of Medinilla magnifica, with 38 drooping spikes of flowers on it; the other end was filled with Palms, large Sobralias, and plants of that description, among which was a young specimen of the Rice-paper plant (Aralia papyrifera). The centre beds in both these compartments have been margined with vitrified masses of brick, which when overrun with Ferns and Lycopods will have an interesting appearance.

Two new glass houses have been added to those at the King's Road end of the nursery, and two more at the Brompton Road end. The latter have ridge and furrow lean-to roofs, and are glazed with Hartley's rough plate glass. They are filled with fruit trees in pots, for the growth of which they have been put up, and for which they seem extremely well adapted. The main walk has been thoroughly drained the entire length of the nursery; the margins have been put in repair, and along a portion of its centre flag-stones have been laid down, which are a great improvement in appearance and comfort. On the borders on either side have been arranged choice Conifers, relieved at intervals with noble standard Bays in tubs, set out after the manner of Orange trees.

In-doors a great many plants are now beautifully in flower; a large portion of one of the Orchid houses is filled with Phalænopsis amabilis and grandiflora, and when we state that we counted 368 glorious blossoms, all open at one time on them, some idea of the kind of display they make may be gleaned. Orchids generally, both in this and other houses, are also in excellent condition, and several are in bloom, but the best are now placed in out-of-the-way houses, to keep them back for Gore House next Wednesday. On one of the rafters of the stove, Lapageria rosea was in flower, but as yet only sparingly, many of its buds being still unexpanded. Although in a stove here, this fine twiner will nevertheless succeed perfectly in a greenhouse. The well-known Stephanotis floribunda, trained along the roof of a low span-roofed stove here, is just beginning to open its sweet-scented blossoms, of which such a crop has not been on it for years. On both sides of the roof are six wiresful of it, running upwards of 70 feet in length, and therefore when the blooms shall have become fully expanded it must certainly be a sight worth seeing. About a year ago last autumn it was taken down, pruned, and well washed with soft soap and hot water, and ever since then it has kept quite clear of insects. Dipladenia acuminata has been planted to run along the centre of the same roof to produce a variety of colour.

At the entrance of the show house—which is gay with flowering things, intermixed with plants remarkable for fine foliage, such as Dracæna indivisa, Norfolk Island Pines, &c.—are cases filled with cones and dried specimens of Wellingtonia gigantea, and other rare coniferous trees, backed by paintings of some of the more remarkable Orchids; here was also a plant of a Belgian Rhododendron named Camille de Rohan, a delicate pink kind, richly spotted with crimson. It is very distinct, with little apparently of the arboreum breed about it, and should it turn out to flower sufficiently late to escape spring frosts, it will doubtless be an acquisition. R. formosum elegans is also a showy kind worth attention.

In a small newly built damp stove were masses of Anæctochilus of different kinds measuring 14 inches in diameter. These were in pans planted in peat, sphagnum, and silver sand, and were covered with bell-glasses. The beautiful Sonerila margaretacea, whose foliage has been described as being "sown with pearls," and the handsome-leaved Begonia Thwaitesi were also here, as were several seedling plants of Platycerium grande, whose seeds sown in peat and sand slightly covered vegetate freely.

In the front of a small greenhouse, now full of flower kept up by Hyacinths, Tulips, Heaths, Cinerarias, the Jasmine and Java Rhododendrons, &c., Moore's patent ventilators have been fixed, and have been found to work satisfactorily. They consist of long panes of glass about 6 inches wide, arranged like Venetian blinds, and moved outwards or inwards by means of a lever acted on by a string. For greenhouses, at least, Mr. Veitch thinks this mode of ventilation perfect.

The large Orange house has been filled with Azaleas, and the Oranges have been moved to one of the new houses which faces the north. Among the Azaleas were plants of the noble Lilium giganteum. The New Holland house was gay with Acacias, Epacrises, and fine plants of Dielytra, which are planted out of doors in summer and lifted and brought under glass in winter. We also noticed here plants of Impatiens Jerdoniæ, which was so much admired at the different exhibitions last year.

Among rarities, in addition to Wellingtonia, which has stood last winter in the open border here, were Abies bracteata, Podocarpus nubigena, from Patagonia; Thuja gigantea, *alias* Libocedrus decurrens, Torreya myristica, Laurus aromatica, a greenhouse plant with very fragrant foliage; Lomatia ferruginea, an evergreen shrub from Chiloe; Escallonia pterocladon, a hardy shrub, which received a Medal at Chiswick in July last; and Desfontania spinosa, also a hardy shrub with fine Holly-like leaves. This stood out of doors last winter in the open ground. In addition to these may be mentioned Story's Epacris Eclipse, which is a very striking variety of the Miniata breed.

Both indoors and out everything is in the best possible order, and well worth inspection.

Miscellaneous.

Poison of the Monkshood.—About two years ago, it will be remembered, a gentleman was accidentally poisoned in Bristol in consequence of eating scrapings of the roots of the Wolfsbane or Monkshood (Aconitum Napellus) in mistake for Horseradish. From a paper that was published in a recent Number of "The Chemist," it appears that Mr. Thornton Herapath, of Bristol, has subjected several specimens of these roots, collected at different periods of the year, to a chemical analysis, and has thus ascertained that the highest proportion of poisonous alkaloid (aconitine) they contain amounts to about a grain and a half in the thousand grains, or more exactly, 10.12 grs. per lb. From these results, and the evidence given at the inquest, Mr. Herapath has satisfied himself that the gentleman in question must have been poisoned by a quantity of aconitine, certainly not exceeding five one-hundredths of a grain in weight. Consequently, the poison of the Monkshood is the most deadly poison known, not even excepting prussic acid. Aconite roots, Mr. Herapath says, may be readily distinguished from those of Horseradish by the scrapings of the former rapidly assuming a pinkish-brown colour on exposure to the air. *Bristol Mercury.*

FLORICULTURE.

Royal South London Floricultural Society, *May* 2.—This was a good show considering the lateness of the season. Pansies in pots were furnished by Mr. Turner, who sent Uncle Tom, Great Western, Crimson Perfection, Constance, Emperor, and Earl Mansfield; Mr. Dobson had Flower of the Day, Lady Emily, Ophir, Fearless, Great Western, and Lady Carrington; these two collections were shown in first-rate condition, the plants being covered with fine large flowers; Mr. August, sent Flower of the Day, Sir J. Paxton, Marion, Sir J. Cathcart, Duke of Perth, and Robert Burns. Twelve Cinerarias: Mr. Turner produced Ringleader, Esther, Kate Kearney, Formosa, Mrs. Beecher Stowe, Estella, Sir C. Napier, Lady Mary Labouchere, Rosy Morn, Lablache, Amy Robsart, and Lady Canoys. These were compact dwarf bushy plants, covered with flowers. Auriculas were in fine health and beauty. An extra prize (Small Silver Albert Medal) was awarded to Mr. Turner, for 3 plants of Ollivier's Lovely Ann. The same exhibitor also furnished Lancashire Hero (Cheetham), Ringleader, Favourite, and Smiling Beauty. An excellent pair of Auriculas was likewise contributed by Mr. Turner, viz., Ne plus Ultra and Apollo (Beestons). Pansies, cut blooms, 24 varieties: of these Mr. Turner sent Earl Mansfield, Monarch, Miss Talbot, Satisfaction, Constance, Comet, Duke of Newcastle, Marion, Emperor, Royal Visit, Ophir, Memnon, Sweep, Royal Albert, Lord John Russell, Queen of the Isles, Victory, Perfection, Red Rover, Marchioness of Bath, Sovereign, Brilliant, Duchess of Sutherland, Sir J. Cathcart; among these, the best were Red Rover, Lord J. Russell, Duke of Newcastle, Perfection, Memnon, Royal Albert, and Satisfaction; Mr. Dobson had Beauty, Emperor, Aurora, Great Western, Marion, Flower of the Day, Gliffe, Albion, Satisfaction, Mr. H. B. Douglas, Father Gavazzi, Lady Carrington, British Queen, Polyphemus, Constance, Lady Emily, Argo, Monarch, Fearless, Charles Cowan, Alice, Marchioness of Bath, Ostrich, Miss Talbot—the above two collections were very good; Mr. August showed Ophir, Samson, Marchioness of Bath, Pandora, Flower of the Day, Mr. T. Samson, Miss Talbot, Sir J. Cathcart, Marion, Meteora, Addison, Aurora, Mr. Beck, Royal Visit, Sir J. Paxton, Sulphurea, splendens, Queen, Joe Miller, Aunt Chloe, Alpheus, Velvet, Thisbe, Duke of Perth, and Adela. A First Class Certificate was awarded to Seedling Pansy Sir Walter Scott (Turner), a yellow ground variety, with clear shield round the eye, fine in form and distinct. Similar award to Admiral Napier (Turner), a large yellow ground flower, with narrow belting of bronze, top petals of same colour, a fine distinct flower for purposes of exhibition. First Class Certificate to Perfection (Turner); this is the finest of the dark yellow ground varieties, the colours are very dense and rich; it also possesses great substance, and is very smooth on the edges. Of other seedling Pansies, there were shown Alpha (Turner), Nonpareil (Turner), and Crimson Perfection (Turner), all yellow ground flowers; the latter is very bright, novel, and smooth. Sir Colin Campbell (Turner) is a large dark variety, an improved Duke of Perth. Of Seedling Cinerarias, Magnum Bonum (Turner) is a large bold flower; Brilliant (Lidgard) is white, tipped with blue, a pretty flower; and Rose of England (Barnes), a beautiful variety, and fine in form. Mr. Roser sent a specimen plant of Azalea, Duke of Devonshire, and three new Azaleas, viz.: Mrs. Barchard, Maria Louise, and Dilecta. Some good collections of miscellaneous plants were also exhibited.

Calendar of Operations.

(*For the ensuing week.*)

PLANT DEPARTMENT.

Conservatory, &c.—When this house contains a mixed collection of plants, which it generally does, aphids are frequently very troublesome at this season, and it is always desirable to avoid smoking here, for besides the expense and annoyance to the family, it is no pleasant job to fill a large house with tobacco smoke. Things in pots that require smoking may be removed to a close room, or put under a frame covered with calico or canvas, rendered air tight either by means of a coat of boiled oil, or peat, where the remedy can be much more conveniently and cheaply applied than in a lofty house, and the risk of injuring the blossoms of things which do not require smoking will be avoided. But if the enemy is to be kept under by this means suspicious plants should be frequently examined, and immediate action taken with those that are found to be the least infected, otherwise the pest will spread to an inconvenient extent to allow of its being eradicated without smoking the house. Should the twiners, or specimens planted out in the beds get infested, these should be syringed with the following mixture, viz: ½ lb. soft soap, 1 gallon tobacco-water, and 6 gallons rain-water, properly dissolving the soft soap in a portion of the water. But as there is some uncertainty about the strength of this mixture and its action on different plants, it should not be used without first making sure that it will not injure the foliage or young shoots, and also that it is sufficiently strong to destroy the insects. The beauty of Azaleas and many other hard-wooded plants which are now the principal ornaments here will soon be fading, and every effort should be used to be prepared to supply their places with others in full beauty.

FORCING DEPARTMENT.

Pineries.—For plants intended for winter fruiting we would recommend using a somewhat lighter soil than is generally employed for Pines, as there will not be so much danger of getting this too wet as when a strong tenacious loam is used. We prefer a compost consisting of about two-thirds mellow turfy loam, with one-third good strong turfy peat, adding a liberal sprinkling of clean sharp sand, and some crushed broken bones, when they can be obtained. In this the plants root vigorously, and fruiters can be liberally supplied with manure water without any danger of the soil getting sodden. But the great advantage of a light soil is that it soon parts with its moisture, and the plants are more manageable in the way of getting them into fruit at the proper time. Maintain a thoroughly moist atmosphere, especially where the fruit is swelling, and give plenty of manure water to all growing stock, as well as to plants in fruit. Vineries.—See that inside borders are properly supplied with water, giving sufficient quantities to thoroughly moisten the whole mass of soil. The Vine is a gross feeder, and absorbs vast quantities of water when in vigorous health and swelling a heavy crop of fruit. Also give a liberal supply of manure water from the stable tank to Vines in pots, first diluting it slightly with warm water to bring it to about the same temperature as the house. Attend to the regulation of the growth, stopping laterals, &c., and timely thinning of the bunches and berries, before they injure the principal foliage. And see that the Vines in the late house are tied up in their places before the shoots get too far advanced, as there is considerable danger of breaking these off when they are allowed to get too long before the rods are tied up. Look sharply after red spider, and use every means to keep clear of this pest. Figs.—Attend to stopping and thinning the shoots and aim at securing short-jointed strong growth, by exposing the young wood to all the light possible. This will, of course, necessitate keeping the trees rather thin, but it is useless hoping for a crop of good fruit from trees that are crowded with wood. Keep the atmosphere moist, and give the foliage a good washing with the syringe after shutting up the house in the afternoon, to prevent red spider, and also see that the roots are kept properly moist. Where the fruit is ripening, syringing must, of course, be dispensed with, and the atmosphere kept drier, therefore be careful to have the foliage perfectly clear of insects up to the time the fruit begins to ripen. Melons.—Maintain a rather close, moist, warm temperature to plants recently planted out until they get into full growth, but avoid inducing a gross habit of growth by too much moisture and warmth after the roots fairly get hold of the soil, for it is generally somewhat difficult to secure a crop from wood of this sort. Give air as freely as the state of the weather will admit, in order to secure firm short-jointed wood, and where the crop is setting, as the young fruit is very apt to damp off unless the atmosphere is kept moderately dry. Endeavour to secure a steady bottom heat of about 80° or 85° for plants in all stages, and also to keep the soil in a proper state as to moisture; avoiding having to water while the crop is setting, by well soaking the soil before the principal blossoms begin to expand. Keep a careful look out for insects, and use every precaution to prevent these getting established upon the foliage, for there is hardly any chance of a crop of fruit unless the foliage can be preserved in health.

FLOWER GARDEN AND SHRUBBERIES.

Notwithstanding that the weather has become somewhat more promising than it has lately been, it will be wise to defer planting out the bedding stock, save in very favoured localities, until we experience a more decided change. Meantime take every opportunity of exposing the plants to the open air so as to get them well hardened off, and see that everything is perfectly free from insects, and also have the whole stock nicely arranged, so that when planting out is commenced everything may be in readiness. Push forward late propagated stock, and endeavour to keep the whole growing slowly in their pots. It is a common and very bad practice to allow bedding stock to stand in small pots exposed to bright sunshine and drying winds, and but scantily supplied with water until they get almost dried up, and this with the view of preparing them for planting out. The plants should be exposed to the weather as freely as circumstances will admit; but this should be done by degrees, and never to the extent of browning the foliage and drying up the tissues, and they should never be allowed to suffer for the want of water, for unless the plants are in good health when planted out, they require endless care afterwards, if the beds are to be covered in any reasonable time, and despite every attention are long of getting into a free state. Endeavour to get mowing and other work here as forward as possible, so as to be able when bedding out can be safely commenced to command sufficient strength to properly care for the plants. Take advantage of showery days to give the Grass and gravel a thorough rolling.

HARDY FRUIT AND KITCHEN GARDEN.

Proceed gradually with the disbudding of Peach and Nectarine trees, but remove only a portion of the buds at once, selecting the strongest first, and going over the trees some two or three times, at intervals of about a week. This will avoid checking the trees to the same extent as when disbudding is done all at once. Be prepared with a supply of tobacco water with which to attack insects immediately they make their appearance, and they will doubtless be plentiful after the long continued cold weather which we have experienced this spring. Look carefully over the Apricot trees and destroy the caterpillar wherever it is found. This is sometimes very destructive to the foliage, and also the fruit when neglected but for a few days, and there is good reason to fear that the late frost has so thinned the crop as to render what remains worth any necessary attention in the way of preserving it from insects. Be in no haste to remove the protecting materials, unless where the crop is found to be destroyed, and then they might be removed for use on trees where there is still a chance of a crop. The fruit on Apricot trees which were unprotected in this neighbourhood is quite destroyed, having been frozen through, and is quite black and falling off, and the crop is doubtful where the trees were well protected by covering. Take advantage of showery weather to plant out Lettuce, Cauliflower, &c., and see to getting Tomatoes, Cucumbers, Vegetable Marrows, &c., prepared for planting out. Make a sowing of Sweet Basil, Marjoram, Savory, &c., on a light rich warm border; also get the early Celery prepared for planting out as speedily as possible, and attend to the plants for succession crops, keeping them at all times well supplied with water, &c.

STATE OF THE WEATHER AT CHISWICK, NEAR LONDON.

For the week ending May 10, 1855, as observed at the Horticultural Gardens.

The highest temperature during the above period occurred on the 19th and 17th, 1833—therm. 86 deg.; and the lowest on the 15th, 1850—therm. 25 deg.

Notices to Correspondents.

Barbe du Capucin: *H.* It is blanched Chicory.

Browning Leaves: *J J S.* If your letter was not post-paid it would, as a matter of course, be refused; and that would account for its having received no notice.

Injured Evergreens: *Ballandyne.* Allow the trees to begin to show new buds; and then cut back to those buds. Orchard Houses, if well managed, and properly constructed, are getting into favour on this side of the Channel. One in the garden of the Horticultural Society is doing capitally. We are surprised to see that on your western coast the evergreens have sustained so much damage.

Insects: *E W M.* We found no grubs in the young Wheat plants sent, but suppose from their appearance that they are infested by the Wheat fly (Chlorops lineata, described in the *Gard. Chron.* 1848, p. 796.) We should think the rain would now cause the roots to throw up side shoots plentifully. Such was the case mentioned by Mr. Markwick.—*R G.* Your Raspberry buds are infested with the larvæ of the pretty little Tinea aubiella, the eggs of which were deposited on the last year's canes. The mischief is done for this year, and all you can do is to prevent future mischief by picking off and burning all the injured buds.—*H.* On looking at your Gooseberry shoots again, we found the paper in which they were inclosed covered with the squashed bodies of numbers of minute red mites, with which the Gooseberry bushes round London have also been much infested. We should advise dipping the ends of the branches in lime water. *W.*

Ivy: *T C.* No doubt your plants are barked by some little animal: mouse? rat? or squirrel? Gas is unfit for heating Greenhouses, unless you can completely prevent the possibility of its finding its way into the houses; and moreover counteract its drying effect by evaporating pans placed where its flame is acting. We never yet saw this accomplished, though many attempts have been made.

Names of Plants: We have been so often obliged to reluctantly decline naming heaps of dried or other plants, that we venture to request our correspondents to recollect that we never have, or could have undertaken an unlimited duty of this kind. Young gardeners, to whom these remarks more especially apply, should bear in mind that, before applying to us for assistance, they should exhaust their other means of gaining information. We cannot save them the trouble of examining and thinking for themselves; nor would it be desirable if we could. All we can do is to *help* them—and that most willingly. It is now requested that, in future, not more than four plants may be sent us at one time.—*R F H.* It is not possible to say whether the morsel you have sent belongs or not to the Juniperus excelsa of the nurseries. It may. The real plant forms in the Crimea a large tree of great beauty, loaded with black berries. That of Siberia and the N. of India is suspected to be different.—*G B.* "Onion wicks" appear to be the knobs of the Grass called Alopecurus bulbosus. It is probably found in some dry pasture near you.—*C.* Leycesteria formosa is a very common hardy shrub, introduced from the Himalaya mountains and belonging to the natural order of Caprifoils.

Pear Trees: *R J M.* For a rather exposed situation and sandy loam, you may procure as standards the Flemish Beauty, Aston Town, Marie Louise, Louise Bonne (of Jersey), Brown Park, Eyewood, Beurré Bosc, Forelle, Knight's Monarch, Passe Colmar, Fondante du Bois, Ne Plus Meuris.

Primroses: *E F.* We are unable to account for the presence of little spine-like processes on the under side of your leaves from Clevedon. The leaf is in other respects so different from that of a common Primrose that we should like to know more about it. Have you a plant to give away?

The Osage Orange: *J R.* It is very strange that this plant should have been for several years invariably killed nearly down to the ground in the dry soil and warm locality of Chelsea, when it used to thrive well enough for hedge-making in the Horticultural Garden at Chiswick.

Woods and Forests: *X Y Z.* Every man has a right to justice, and we hope we never shall imitate the conduct of Messrs. Gladstone and Wilson, by condemning Mr. Howard without trial as they did Mr. Brown. The honourable gentleman may prove to be efficient, and if so he has nothing to apprehend from the conductors of this journal. If high connections are, as you say, no guarantee of fitness, so *we* say that they in no degree prove incapacity. If a man is not the better for having a handle to his name, surely he is not the worse for it; and in reality there are cases in which it may be a real advantage to the public service.

Yew Hedge. *South Derbyshire.* Transplant in the beginning of September, filling the soil loosely, not treading it, but deluging it with water in order to settle it about the roots. Then cover the whole with earth, and leave the plants to their fate. But very old Yews are hardly worth removal, and are very apt to die. You had better leave them where they are, cutting all the branches to within 6 inches of the trunks. This will, in all probability, make the trunks break out all round with new shoots. Perform such an operation in the month of February. As to the value of Yew wood, that is quite a local question, which can only be answered satisfactorily by the country dealers in timber.

Misc.: *E X.* Mr. Black, Covent Garden.

*** As usual, many communications have been received too late and others are unavoidably detained till the necessary inquiries can be made. We must also beg the indulgence of those numerous correspondents, the insertion of whose interesting contributions is still delayed.

PERUVIAN GUANO, Bolivian Guano, Superphosphate of Lime, Nitrate of Soda, Sugar Scum, and every description of Artificial Manures, Linseed Cakes, &c.

WM INGLIS CARNE, 10, Mark Lane, London.

FOR PUBLIC SALE, for Account of the Underwriters, on MONDAY, May 21st, at the New Corn Exchange Mark Lane, at 2 o'clock precisely, by order of Messrs. ANDREW GRAHAM & SON, the Importers, 800 Tons (damaged) PERUVIAN GUANO.—J. A. RUCKER & BENCRAFT, Brokers, Commercial Sale Rooms, Mincing Lane.

PATENT SANITARY SEWAGE COMPANY'S NITRO PHOSPHATED CARBON OR BLOOD MANURE, £6 10s per ton; delivered in London, bags included. Each ton contains 130 lbs. Blood and 11 per cent. of Phosphate of Lime.—Agents throughout the country.

92, Lincoln's Inn Fields, London.

THE FOLLOWING MANURES are manufactured at Mr. LAWES' Factory, Deptford Creek:—Turnip Manure, 7l. per ton; Superphosphate of Lime, 7l.; Sulphuric Acid and Coprolites, 6l.

Office, 69, King William Street, City, London.

N.B. Genuine Peruvian Guano, guaranteed to contain 16 per cent. of ammonia. Nitrate of Soda, Sulphate of Ammonia, and other Chemical Manures.

CORN MANURE FOR SPRING SOWING.
CONCENTRATED URATE FOR GRASS, RAPE, AND ALL ROOT CROPS.
SUPERPHOSPHATE OF LIME.

THE LONDON MANURE COMPANY continue to manufacture the above Manures, which have been used with so much success for the last 14 years.

The London Manure Company also supply PERUVIAN GUANO (direct from importers' warehouses), Nitrate of Soda, Sulphate of Ammonia, Fishery and other Salts, Bone Dust, and every artificial manure of known value. EDWARD PURSER, Sec.

Office—40, Bridge Street, Blackfriars.

TURNIP SOWING.—The Undersigned beg to offer their valuable Supherphosphate of Lime (See "Royal Agricultural Society's Journal," Vol. VI., Part 2), Turnip Manure, and Nitro-phosphate or Blood Manure.

Also on sale, Guano, Nitrate of Soda, Gypsum, Bone-dust, Sulphuric Acid, Salt, and all other Manures of known value. Agents for the sale of Peat Charcoal.—Apply for Prices Current to MARK FOTHERGILL & Co., 204A, Upper Thames Street, London.

PATENT WOOL MANURE. — This new and valuable manure prepared by the artificial decomposition of woollen rags with a due admixture of alkaline salts and phosphates, is now ready for delivery. It is recommended to be applied in the same manner and in the same quantity per acre as Peruvian Guano, to which article it has (in the few experiments already made) proved itself equal, if not superior, in fertilising power, as may now be seen on several farms where the two manures have been applied side by side, at an equal weight per acre; thus effecting a saving of at least 30 per cent. Price 8l. 8s. per ton, or 9s. per cwt., delivered free to any railway station or wharf in London. Terms—cash on delivery.

NOTTIDGE & Co., Manufacturing and Agricultural Chemists, 81, Gracechurch Street, London.

Agents—R. R. MANNING, Medbury, near Bedford; G. BELSEY, St. Peter's, near Margate; S. SMITH, 81, Gracechurch Street; L. OLDIS, Clock House, Braintree, Essex; C. J. MACKLIN, Bantingford, Herts.

THE LANDS IMPROVEMENT COMPANY, INCORPORATED BY SPECIAL ACT OF PARLIAMENT FOR ENGLAND AND SCOTLAND.—To Landowners, the Clergy, Solicitors, Surveyors, Estate Agents, &c.—Loans may be contracted for the execution by the proprietor or by the Company of every landed improvement, especially Drainage, Building, Clearing, Enclosing, Warping, Irrigation, Embanking, Reclamation, Roads, Planting, Machinery, &c. The plans (of buildings), specifications, and estimates are prepared by the proprietors, and are submitted to the approval of the Enclosure Commissioners. Proprietors may avail themselves of the powers of the Act to recover from the inheritance their own funds to be expended on improvements. They may also apply jointly for the execution of a mutual improvement, such as a common outfall, &c. For forms of application, &c., apply to the Hon. WM. NAPIER, Managing Director, 2, Old Palace Yard, Westminster.

THE GENERAL LAND DRAINAGE AND IMPROVEMENT COMPANY
INCORPORATED BY SPECIAL ACT OF PARLIAMENT.
Offices, 52, Parliament Street, London.

DIRECTORS.

HENRY KER SEYMER, Esq., M.P., *Chairman.*
SIR JOHN V. SHELLEY, Bart., M.P., *Deputy-Chairman.*

George Thomas Clark, Esq.
John C. Cobbold, Esq., M.P.
Sir William Cubitt, F.R.S.
Henry Currie, Esq.
Thomas Edward Dicey, Esq.
William Fisher Hobbs, Esq.
Edward J. Hutchins, Esq., M.P.
Sir S. M. Peto, Bart.
William Tite, Esq., F.R.S.
William Wilshere, Esq.

Empowered to execute Drainage, Road-making, and other Land Improvements, and to Erect Farm Buildings upon Estates under Settlement, Mortgage, or otherwise; or Church property, and without investigation of Title to charge the whole outlay and expenses upon the Estate, to be repaid by instalments spread over any period determined by Landowners within the limits of 50 years for Drainage and Roads, and 31 years for Farm Buildings. Landowners may arrange with the Company for the execution of the works by their own agents, with the use of their own or the Company's Capital.

WILLIAM CLIFFORD, Sec.

SEVEN PER CENT. BONUS.

THE CONSERVATIVE LAND SOCIETY.—Notice is Hereby Given, that WARRANTS for the PAYMENT of the GUARANTEED INTEREST on completed Shares, and on Subscriptions of Shares in progress, of a year in advance and upwards, at the rate of 5 per cent. per annum, will be ISSUED on and after the 26th of April, for the half year ending March 25, and will be forwarded to the respective Members in due course. The Holders of completed Shares will also be entitled to receive an additional 2 per cent., in order to make every payment into the Society, by Shareholders prior to last Michaelmas, realise 7 per cent., being the bonus declared by the Executive Committee of the Conservative Land Society for the second financial year, ending Sept. 29, 1854. (By Order of the Board.)

CHARLES LEWIS GRUNEISEN, Secretary.

Persons who may be desirous of investing capital and savings with complete security and freedom from personal liability may use the Society as a bank of deposit, or savings bank; and the taking of land being quite optional, it will be open to the members at any time to select plots on eligible estates, in various counties, so as to secure the freehold franchise and first rate ground rents. A completed share, which is at once entered on the register of rights, to choose pieces of land, cost 52l. 5s. 6d., including the conveyance of the lot, if taken, and all charges. An uncompleted share, paid a year in advance, so as to be entitled to 5 per cent. interest, payable half-yearly, as on the completed shares, is 5l. 3s. 6d. Monthly subscriptions on shares in progress are 9s. per month, with 1s. quarterly to cover working expenses, and 2s. 6d. entrance fee per share.

Prospectuses and Forms for taking shares will be forwarded, free of expense, on application to the Secretary, at the Central Offices, No. 33, Norfolk Street, Strand, London; or to the Agents for members in the chief towns in the United Kingdom. All subscriptions on shares paid into the Society can be withdrawn, under the rules, at 10 days' notice.

ROYAL AGRICULTURAL SOCIETY OF ENGLAND.—PROFESSOR WAY'S LECTURE "On the Chemical Principles involved in the Production of Butter," will be delivered before the Members, at the Society's House, in Hanover Square, London, at 12 o'clock, on WEDNESDAY, the 16th of May.

The GENERAL MEETING of the Society will be held at 12 o'clock, on TUESDAY, May 22d. By order of the Council,

JAMES HUDSON, Secretary.

THE CONSULTING CHEMIST of the Royal Agricultural Society of England has removed his Laboratory to 15, Welbeck Street, Cavendish Square, where all communications and substances for analysis should in future be addressed. The Laboratory is open to Gentlemen wishing to study Agricultural Analysis, for which purpose it offers considerable advantages.

YORKSHIRE AGRICULTURAL SOCIETY.—PRIZE SHEETS for the MALTON MEETING may be had of the Secretary, Mr. JOHN HANNAM, Land Agent, Wetherby.

TESTIMONIAL TO J. B. LAWES, Esq.—The Committee beg to inform those interested in the above undertaking, that the New Laboratory is expected to be ready for presentation in May or June, until which time the Subscription List will remain open, to afford an opportunity to any who may still wish to associate their names with this acknowledgment of Mr. Lawes' services.

Communications to be addressed to
Mr. W. KERL, Hon. Sec., Harpenden.

CHEMICAL ANALYSIS.

MR. H. MEDLOCK (formerly Chief Assistant in the Royal College of Chemistry) begs to inform Agriculturists that he undertakes the Analysis of Soils, Manures, &c., on moderate terms. Mr. Medlock also gives instruction to Gentlemen in Agricultural Chemistry at his private Laboratory, 20, Great Marlborough Street, London.

COLLEGE OF AGRICULTURE AND CHEMISTRY, AND OF PRACTICAL and GENERAL SCIENCE, 37 and 38, Lower Kennington Lane, Kennington, near London.

Principal—J. C. NESBIT, F.G.S., F.C.S., &c.

The system of studies pursued in the College comprises every branch requisite to prepare youth for the pursuits of Agriculture, Engineering, Mining, Manufactures, and the Arts; for the Naval and Military Services, and for the Universities.

Analyses and Assays of every description are promptly and accurately executed at the College. The terms and other particulars may be had on application to the Principal.

ARTIFICIAL MANURES, &c.—Manufacturers and others engaged in making ARTIFICIAL MANURES may obtain every necessary instruction for their economical and efficient preparation, by applying to J. C. NESBIT, F.G.S., &c., Principal of the Agricultural and Chemical College, Kennington, London. Analyses of Soils, Guanos, Superphosphates of Lime, Coprolites, &c., and Assays of Gold, Silver, and other Minerals, are executed with accuracy and dispatch.

Gentlemen desirous of receiving instructions in Chemical Analyses and Assaying, will find ample facility and accommodation at the College.

TO ARTIFICIAL AND CHEMICAL MANURE MANUFACTURERS AND MANUFACTURING CHEMISTS.

MR. COOKE, CHEMICAL ENGINEER & MANUFACTURING CHEMIST, contracts for the erection of Sulphuric Acid Chambers, and Chemical Plant generally on the most approved forms. Practical instructions from 12 years' experience in the trade given in the working of Acid Chambers, and in the manufacture of all kinds of Artificial Manures, Superphosphates, and Guanos. Receipts for the best mixtures furnished, and other information on application.—For terms, &c., apply by letter to 6, St. Thomas Terrace, Newcastle-on-Tyne.

TANNED NETTING, for the protection of Fruit Trees from frost, blight, and birds, and for the security of fresh sown seeds, either in Gardens or Fields, at 1d. per square yard; 200 yards, 14s.; 500 yards, 30s.; 1000 yards, 50s. Scrim Canvas, for Wall Fruit.—At EDGINGTON and Co.'s, Rick Cloth, Tent, and Waterproof Cloth Manufacturers, 17, Smithfield Bars, City, and Old Kent Road, Southwark; Emigrant Outfitters, Ship Chandlers, and Export Merchants, Brunswick Street, near the East India Export Dock, Blackwall.

FRUIT TREES, POULTRY, RABBIT, SHEEP, AND LAMB FENCING.—Worsted Netting, to protect the Bloom of Peach, Nectarine, and other Trees, Flower or Seed Beds, from frost, blight and birds, 2 yards wide, 5d. per yard. New Twine Netting (tanned if required), 1 yard wide, 2d. per yard; 2 yards wide, 4d. per yard; 4 yards wide, 8d.; half-inch Mesh do., 2 yards wide, 8d. per yard. Tanned Netting, 2 or 3 yards wide, 1½d. per yard; 4 or 6 yards wide, 3d. per yard. Elastic Hexagon Garden Net, or Scrim Canvas, 4½d. per square yard. Cocoa-nut Fibre, or Hemp Sheepfolding Net, of superior quality, 4 feet high, 4d. to 6d. per yard. Rabbit Net, 4 feet wide, 2d., 6 feet wide, 3d., 8 feet, 4d. per yard. Each edge corded, ½d. per yard extra, suitable for Poultry Fencing. Square Mesh Cricketing Net, fix its full width and length, made of stout cord, 3d. to 4d. per square yard; this is the best article for Fencing against Fowls, Cats, &c.—W. CULLINGFORD'S, 1, Edmund Terrace, Ball's Pond, Kingsland, London.

A 20-yard Drag Net, with purse complete, 2l. 10s.; a Single Walled Drag Net, any length and depth, 1s. per square yard; Casting Nets, complete, 1s. per yard, measured round the lead line; Flue Nets, any size, 1s. per square yard complete. Minnow Nets, Eel Nets, and Landing Nets equally cheap, all warranted first-rate quality and workmanship.

GALVANISED WIRE GAME NETTING.—7d. PER YARD, 2 FEET WIDE.

		Galvanised.	Japanned iron.
2-inch mesh, light, 24 inches wide	...	7d. per yd.	5d. per yd.
2-inch " strong "	...	9 "	6½ "
2-inch " extra strong "	...	12 "	9 "
1⅝-inch " light "	...	8 "	6 "
1⅝-inch " strong "	...	10 "	8 "
1⅝-inch " extra strong "	...	14 "	11 "

All the above can be made any width at proportionate prices. If the upper half is a coarse mesh, it will reduce the prices one-fourth. Galvanised Sparrow-proof Netting for Pheasantries, 3d. per square foot. Patterns forwarded post free.

Manufactured by BARNARD & BISHOP, Market Place, Norwich, and delivered free of expense in London, Peterborough, Hull, or Newcastle.

WATERPROOF PATHS.
BARN AND CATTLE SHED FLOORS.

THOSE who would enjoy their Gardens during the winter months should construct their walks of PORTLAND CEMENT CONCRETE, which are formed thus:—Screen the gravel of which the path is at present made from the loam which is mixed with it, and to every part of clean gravel add one of sharp river sand. To five parts of such equal mixture add one of Portland Cement, and incorporate the whole well in the dry state before applying the water. It may then be laid on 2 inches thick. Any labourer can mix and spread it. No tool is required beyond the spade, and in 48 hours it becomes as hard as a rock. Vegetation cannot grow through or upon it, and it resists the action of the severest frost. It is necessary, as water does not soak through it, to give a fall from the middle of the path towards the sides.

The same preparation makes first-rate paving for BARNS, CATTLE-SHEDS, FARM-YARDS, and all other situations where a clean, hard bottom is a desideratum. May be laid in winter equally well as in summer.

Manufacturers of the Cement, J. B. WHITE & BROTHERS, Milbank Street, Westminster.

LINGHAM BROTHERS, No. 170, Hampton Street, Birmingham, sole Manufacturers of the improved WOOD and ZINC MONOGRAPH, or LABELS for Garden Borders, Flower-pots, &c., in boxes of 100 each. The Zinc Labels are highly approved of for their lasting durability, can be written upon with the greatest ease, and when dry a permanent inscription is secured. Directions are sent with each box, including a bottle of metallic ink.—Sole Agents in London, Messrs. DRAKE, DRAY & Co., Horticultural Implement Warehouse, 46, ing William Street, London Bridge.

PRIZE MEDAL—1851.
AT A VERY ECONOMICAL RATE.

SAMUEL CUNDY, MASON and BUILDER, PIMLICO MARBLE and STONE WORKS, Belgrave Wharf, Lower Belgrave Place, Pimlico, London.

Marble Chimney-pieces manufactured by improved machinery. The public are invited to view the stock, unequalled for quality and price. A good Marble Chimney-piece for 40s. Marble Work in all its branches at a remarkably cheap rate for Halls, Dairies, Larders, &c. Circulars sent on application.

N.B. The "Royal Blue" Omnibuses pass the Works every ten minutes from the Bank.

ESTABLISHED ABOUT HALF A CENTURY.

AGRICULTURAL SEEDS OF THE FINEST SELECTED STOCKS.—*As the quantity of Mangold, some of the Turnips, &c., are found not so scarce on the market as was expected at the close of harvest, we submit our present prices, in which several will be found lower than quoted in our Spring Catalogue.*

	Per lb.—s.	d.		Per lb.—s.	d.
Mangold Wurzel, Long Red	0	8	Turnip White Decanter, or Norfolk Bell ...	1	2
" " Long Yellow	1	0	" Green Barach ...	1	2

" Lincolnshire Red Globe	1	2	Alsike Clover	2	0
" Pomeranian White Globe	1	2	Bokhara Clover	2	6

PERMANENT PASTURE AND OTHER GRASSES.—Our Mixtures for Permanent Pastures will be found equal to any which are supplied. Prices per acre, according to the nature of the soil, 24s. to 34s. Wholesale Prices of Grasses and other Seeds to the trade on application.

Finest Mixed Lawn Grasses, per lb. 1s., or 4s. 6d. per peck.

☞ GOODS CARRIAGE FREE (not under 20s.) to all the London termini, or any station on the Colchester and Norwich line.

BASS AND BROWN, Seed Establishment, Sudbury, Suffolk.

GRASS AND AGRICULTURAL SEEDS.

THOMAS GIBBS AND CO., the SEEDSMEN to the Royal Agricultural Society of England, beg to inform their friends and agriculturists generally that they are now prepared to supply the undermentioned in any quantities required.

Mixtures of Grass Seeds for laying down land to permanent Pasture and Meadow; Irrigation or Water Meadow Mixtures; Upland Sheep Walk Mixtures; Park and Field Lawn Mixtures; Renovating Mixtures for old Swards; Garden, Lawn, or Grass-plot Mixtures; various Permanent Grass Seeds supplied separately to order; Mixtures for one year's lay, do. for two or three years' lay (commonly called "seeds").

CLOVERS.—Red or broad leaved, white or Dutch, Red Suckling, Alsike or Hybrid, Trefoil, Cow Grass or Perennial.

RYE-GRASSES.—Italian (very fine), Annual, improved Perennial, and other kinds.

CARROTS.—Large White Belgian, large field Altringham, Yellow Belgian, long Orange or Surrey.

PARSNIPS.—Gibbs' large Guernsey Cattle, common large.

MANGOLD WURZELS.—Long Red, Orange or Yellow Globe, Red Globe, long Yellow.

CABBAGES.—Large Drumhead Cattle, Thousand headed.

TURNIPS.—Purple-top Swedes, Green-top Swedes, Skirving's Swedes, Green-top Yellow Hybrid, Red-top Yellow Hybrid, Globes or Rounds, Tankard's sorts, Kohl Rabi.

Lucerne, Broom, Furze or Gorse, Field Parsley, Rape, Seed Barley sorts, Wheat sorts, Rye, Sainfoin, Tares, White Mustard, White Silesian Beet, Peas, Potatoes, and all other seeds for the farm.

KITCHEN GARDEN AND FLOWER SEEDS, including all the new and most approved varieties. Assortments made up to suit different sized gardens, or to any given amount.

Priced Lists of both Agricultural and Garden Seeds sent free by post on application to THOMAS GIBBS & Co., Corner of Half-Moon Street, Piccadilly, London.

The Agricultural Gazette.

SATURDAY, MAY 12, 1855.

MEETINGS FOR THE ENSUING WEEK.

WEDNESDAY, May 16—Agricultural Society of England.

THE question—How shall we find food for our stock? is happily receiving its best answer by the rapid growth of green food under the refreshing showers of the last few days; for we have at length the sound of abundance of rain. The remedy for the severe drought and cold weather of the last two months has happily come before much mischief has been done, and a somewhat later harvest will probably be the utmost blame that can be laid upon the season hitherto.

AMONG the discouragements which beset, and often arrest altogether the progress of one who is endeavouring, perhaps late in life, to acquaint himself

with the *science* belonging to an art which forms his daily business, none is more mischievous in its first effect upon his mind, or more baffling to the resolution, than to be struck every now and then with the feeling that he is stepping from the land of certainty, or what he *believes* certainty, into a sea of doubt. Like a landsman who for the first time feels the unaccustomed motion of the waves, and experiences a sensation as much the opposite as can be well imagined of the day's 'pleasuring' he had promised himself in the gaily-painted craft to which he had consigned himself and his prog-basket, he begins to register a vow that—let him once set foot on terra firma again, and he'll have nothing more to do with an element that far from sharpening his appetite for *more*, actually seems to put in jeopardy what he had thought he *could* call his own! Many a man has left the first lecture-room he ever attended, of 'agricultural chemistry' with just such a feeling as that here faintly hinted at; and this sensation is due not merely to the chopping sea of hard words and phrases he is sure to find running ahead, but derives its worst qualms from a sort of ground-swell he becomes writhingly conscious of, appearing to affect the whole surface of the lecturer's discourse, —the under-current of *doubt*.

To the practical man this is intolerable. For there is this striking difference between 'practical' and 'scientific' knowledge; that the former leads a man to trust to himself, by concentrating his view upon what he *has* acquired, however limited the field, while it is the melancholy virtue of the latter to teach him to distrust himself and his conclusions, by opening out to his eyes part of the infinite field of the unknown. They look, as it were, through opposite ends of the telescope. Yet, for *action*, the first, for *knowledge* the second frame of mind, is indispensable. For even to her aptest scholars Nature is chary of her secrets, they do but

> "Show his eyes, and grieve his heart,
> Come like shadows—so depart."

and the only wonder is that the man who in his own person has proved the toilsomeness and slow reward of field labour,—how much it takes to earn such small apparent results,—should come into the lecture-room of Science expecting and demanding such instantaneous rewards. Let them come as plenty as blackberries or thick as hailstones, he should bear in mind they must still be *others'* property as well as *his!* Knowledge is no monopolist. He could carve no 'patent' out of it. He must be content to share only with the rest of mankind: so that the *individual* benefit which Practice sometimes petulantly claims at the hands of Science is a mere dream; beyond the general saving of waste, toil, and expense, which knowledge and discovery lead to, and in which all are free to participate alike. The mind directs the hand; the head saves the heels: that is the history and answer of 'scientific' knowledge, like every other kind of knowledge: and surely the former President of the Royal Agricultural Society was wrong to answer folly according to its folly, when he agreed to count up, and even to extenuate, the practical bequests of chemistry to agriculture, as consisting hitherto only in "Liebig's suggestion for dissolving bones in sulphuric acid and Sir Robert Kane's for using flax-water as manure." The Professor of Giessen—we beg his pardon—now of Munich, holds the compliment rather cheaply, and replies that "in a chemical" (we suppose he means a scientific) "point of view such recipes have no greater value than a recipe for good blacking," and denies altogether such a limitation of the gifts of chemistry to farming, declaring that "*dozens* of prescriptions or recipes like that alluded to by Mr. Pusey may be found, in books which treat of the application of Chemistry to agriculture."

So they may; and many of them worthless enough; like that, so confidently put forward, for fixing the volatile ammonia of stables and dung-heaps by means of an insoluble and well nigh impulverable salt, the sulphate of lime. But Baron Liebig seems to have misconceived the tone and spirit of Mr. Pusey's remark, which was not to depreciate the advantages of chemical knowledge to the agriculturist, but to moderate the extravagant expectations of that day, and to mitigate the resulting disappointment of those who looked to "doubtful chemistry" for "good farming," and expected of science what science does not profess, and is not calculated to give, viz., sudden and individual accessions of power or gain. Though it was an odd way of setting about the task, by almost indorsing the very prejudice it was desired to cancel.

Perhaps no instance has occurred, heretofore, in which the actual field practice of the farmer, is so prominently concerned and even implicated in the settlement of a question of 'doubtful chemistry,' as in the discussion now pending, on the Nutrition of Plants, between the advocates and the opponents of what is called Liebig's 'Mineral Theory.' It is a 'pretty quarrel as it stands,' because it embraces some of the very points most important to be known on 'the relation of the atmosphere and the soil:' and to give it what intelligence we may to those who have not penetrated very far into the mysteries of science, we shall weary our learned readers by bringing up the rear from the point we lately reached, after introducing the four great *organic* elements, which worse, by one head, than Cerberus himself, may be said to guard the very portals of agricultural chemistry. When the objection is once surmounted, which the 'natural' mind entertains against the alternation of matter between its *visible* and *invisible* forms; when this difficult and narrow portal of incredulity is once left behind, the road becomes altogether easier: the theory of 'combustion,' once explained, accounts for the sudden *disappearance* of so very large a portion of vegetable or animal matter when burnt, and the term 'burning' no longer suggests the idea of annihilation, but of mere resolution of the plant, or animal, into its visible, and its invisible, elements; the one part of that which seemed corporeal, melting like breath into the wind, as though the earth had bubbles as the water has; the other part remaining in the small and tangible residuum of 'ash.'

Now touching this ash, Liebig lays it down in the most recently published statement of his views, as the 2nd of fifty 'propositions', in which his principles are collected and embodied, that "On the most diversified soils, in the most varied climates, whether in plains or on high mountains, plants invariably contain a certain number of mineral substances, and, in fact, always the same substances; the nature and quality, or the varying proportions of which are ascertained *by finding the composition of the ashes of the plants.* The mineral substances found in the ashes were originally ingredients of the soil: all fertile soils contain a certain amount of them; they are never wanting in any soil in which plants thrive." In his first 'Proposition' he had stated that the organic elements, oxygen and carbon, through their compound, *carbonic-acid;* and nitrogen and hydrogen, through their compound, *ammonia,* are obtained by plants from Air and Water. All this is admitted and understood by men of science.

Now, without entering at present on the enumeration of the mineral substances alluded to in Prop. 2, just noticed, we will plunge at once in *mediam rem,* by taking the passage quoted by Liebig from Mr. Lawes' Essay at p. 2 of Vol. XII., part I. of the Journal of the Royal Agricultural Society, which is as follows: "In the course of this inquiry, the whole tenor of our result has forced upon us opinions different from those of Prof. Liebig on some important points; and more especially in relation to his so-called Mineral Theory, which is embodied in the following sentence, to be found at p. 211 of the 3d edition of his work on 'Agricultural Chemistry,' where he says, 'The crops on a field diminish or increase in exact proportion to the diminution or increase of the *Mineral substances conveyed to it in manure.*'"

Here then, we have what lawyers would call the 'Declaration' and the 'Plea.' In Prof. Liebig's little work just published, and entitled 'Principles of Agricultural Chemistry, with special reference to the late researches made in England,' we have the 'Replication,' together with the 50 'Propositions' above referred to. To this we hope to return, when we have digested some of the ingredients or rather the condiments with which it is flavoured—colloquially speaking, *sauced,*—to the English palate. *H.*

It was of some public interest to ascertain the degree in which the reputation of the short-horn breed of cattle has of late years been maintained, and several articles on that subject will accordingly be found in current numbers and past volumes of the *Agricultural Gazette.* The point is, of course, to be determined by references to sales of herds and individual animals; and remarkable instances of this description have been brought under the notice of our readers as often as they occurred. The last occasion of the kind was the Hendon sale of last month. We considered and believe that the prices realised by Mr. Tanqueray's herd proved the increasing reputation of the breed, and a writer in the *Mark Lane Express,* whom we supposed to utter more than a merely individual judgment, having expressed his opinion that the prices reached, great as they were, had not been, as an average, very extraordinary, we quoted him to show that the character of the breed stood even higher than these prices indicated. It appears, however, that the opinion quoted is not *completely* the opinion uttered—the latter described the sale as being "not for an average a very extraordinary one, *considering the pains and cost at which* Mr. Tanqueray *had collected the herd;*" and our contemporary imagining that our object was to expose his judgment of the value of short-horn cattle, expresses his displeasure at our omission of these words. But this was not our object:—if we had supposed that the writer of that sentence was giving merely his personal opinion we should not have noticed it at all—it was because we imagined that he was uttering the opinion of agriculturists that we referred to it—for our object was to show that the average, high as it was, had not reached the height to which, in *agricultural* judgment, it ought to have attained. Besides, the quotation, though imperfect as to length, *is* perfect as to fairness for the purpose to which we have applied it. We did not, indeed, quote this writer's reference to the circumstances under which, in his opinion, the Hendon sale is not extraordinary; but these circumstances do in reality enhance the value of the event as a testimony to the reputation of the short-horn blood. For what has been the history of the Hendon herd?

Mr. Tanqueray—a gentleman not previously interested in agriculture—did not seven years ago own a single short-horn: during that interval he has gathered a herd together—at great cost no doubt—but at a cost forced upon him at the sales by auction where his purchases were made—a cost therefore which proves not merely the individual enterprize which our contemporary admits, but the general estimation in which the breed is held; and this is the very point to which our remarks were directed. And that this general estimation is proved more incontestably than ever by the circumstances of this sale will appear from an enumeration of some of them which our contemporary does not seem to have been acquainted with. For instance, though collected at such cost, the herd did, we are assured by one able to inform us, realise last month nearly double the sum needed to balance its account. Again: some of the best animals were disposed of privately before the sale—a Duchess heifer, especially, for 500 guineas—and in fact nearly five thousand pounds' worth of animals had been *thus* disposed of during the past two years! Thirdly: some of the animals purchased nominally by Mr. Tanqueray were in reality purchased by him in partnership with Americans, and having passed from his hands cannot be quoted in explanation of the Hendon average (the Duke of Glo'ster, for instance, for which 650 guineas were paid at Tortworth, and for which Mr. Tanqueray would have given 1000 guineas, has since crossed the Atlantic). Lastly: the animals purchased at greatest cost are precisely those which have yielded largest profits: thus, we may take three, and these shall include some of the highest priced animals that Mr. Tanqueray ever purchased —Oxford 11th, for instance, and Oxford 16th, for which 250 and 180 guineas were given at Tortworth; these three, with their produce, sold for 1050 guineas more than had been given for them. The circumstances of the sale we submit, then, make it more than ever the remarkable event which we believe it to have been, and the writer in the *Mark Lane Express* cannot justify his opinion of *it* by any reference to *them.* They constitute a sufficient answer to the first part of his angry notice of our last week's article.

As to the second part of his critique we must simply confess that it is unanswerable. Having lived more in the field than in the street we are happily saved by ignorance as well as choice from bandying personalities in slang phrases.

A DAY WITH THE STEAM PLOUGH.

Having resolved to see for myself what measure of success has attended Lord Willoughby d'Eresby's steam ploughing, I lately paid a visit to Grimsthorpe, his lordship's seat in South Lincolnshire; where, besides the attraction of such a novel mode of tillage, the tourist may find objects of interest in the embattled towers of the castle, in the gardens, the picturesque village, and an extensive park with its noble forest trees, and fine sheet of water 100 acres in extent. My way there lying through a part of the Fens, I had the agreeable opportunity of inspecting in their proper order the separate steps by which steam-power has been successively applied to agriculture. First, I crossed over numerous large drainage canals and wide ditches having no outfall into which they can discharge the land-floods pouring into them; and powerful fixed steam-engines (two of which I passed by), are therefore erected to bale out the rain-water and springs of the entire country. Were they to cease working, tens of thousands of acres now highly cultivated, planted, and studded over with farm buildings and clustered villages would be one vast shallow lake. Next, I observed in the rick-yards of those steam-dried fens portable steam-engines busily threshing; in one yard the farm horses were actually standing unharnessed, and comfortably looking on while their welcome helper, the engine, was panting and perspiring at their hitherto accustomed labour. "Surely," thought I, "as steam has first

drained a whole district while fixed at one corner of it, and then perambulated in a portable form into every farmstead upon it, to do any work required there, the next step will be on to the surface of the fields themselves, to till, manure, or sow there." However, on arriving at Grimsthorpe, I found that a still intervening step has been taken. His lordship, justly noted as "a good landlord," has established some "works," where all sorts of steam-saws, lathes, boring, morticing, and planing machines for wood and metal are always busy, performing work for the tenantry, and practically demonstrating to a rural population the many facilities and advantages of such machinery. A steam flour mill also crushes corn for cattle food, &c., and grinds meal for "the cottagers" at one farthing per bushel. There are four portable engines each of from 24 to 26 horse-power, connected with the establishment; one constantly engaged in driving the above works, two employed in drawing the steam-plough, thrashing on various neighbouring farms, and grinding the clay for three brick-yards; while the fourth is made locomotive for running upon common roads, and forms the next kind of steam application to agriculture above alluded to. The Great Northern railway having a station four miles off, Lord Willoughby constructed a good stone road to it for the use of his tenantry and the public, and contrived an engine to travel to and fro with coal, &c., for his castle. This engine has three cylinders working underneath the boiler, and an ingenious steerage-apparatus, and draws several loaded break-waggons up steep inclines; but his lordship is now converting the common road into a railway by laying down wooden blocks, at an expense (we were informed) of 2000*l.* per mile; a great quantity of Ash timber having been felled for the purpose. When this line is completed the farmers will be saved four miles in the delivery of corn or fetching of coal, and will be charged, it is supposed, a very small amount for carriage.

The history of the steam plough appears to be this: seven years ago Lord Willoughby—who is a skilful amateur in mechanical contrivances—designed an engine and tackle for the traction of ploughs; consulting his enterprising bailiff, Mr. Scott, together with the intelligent foreman of the works, as to the best form and arrangement of the implement itself. The first trials were made with a single engine working an endless chain stretched between it and an anchored pulley at the opposite side of the field; but the slack or return chain proved an insuperable obstacle; and as the anchor would not hold against the ploughs in work, they had to be drawn empty towards it—ploughing only when approaching the engine. The frame of ploughs was intended to travel at the rate of five miles per hour, which was of course impracticable, seeing that it was necessary to have men to guide it. Two engines have been found indispensable, each working and resting alternately, as the implement traverses to or from them; and only a single length of chain is employed, which unwinds itself from the barrel upon one engine, while being gathered by that upon the other. Attempts were made to use common rope, which could not stand the wear. Another method of obviating the great friction of the chain along the ground, was having two boys to follow or precede the implement with small barrows fitted with friction rollers to hold up the chain; this also was abandoned.

The present plan of working is as follows:—one engine, with its "tender" carrying coke and water, stands upon two 20-feet deals laid on the headland; and with two other planks alternately laid down and shifted forward, the engine can travel the whole length of the headland upon a sort of portable railway. At every bout of the implement the engine moves forward a few feet, equal to the breadth of furrows ploughed—propelling itself by gathering up a chain attached to an anchor at the end of the headland. The other engine, similarly mounted upon planks and travelling in a parallel direction, is set 165 yards down the field, and the chain drawing the implement extends between the two engines, being alternately wound and unwound by each. It takes a couple of men to lift and carry one of the planks.

The implement I saw consisted of three ploughs fixed in a long trussed iron frame, having four wheels to steady it, and two handles at each end for steering. One man walks near the fore-end and another follows behind, going at the pace of from three to four miles per hour. The plough is not turned round at the end of the work, but is constructed with double shares, coulter, and mouldboards, so as to throw its furrows in the same direction when going back again. Nothing is necessary but to adjust the ploughs by a shifting movement within their frame in order to follow each other, and then move the whole implement sideways for another three furrows. The first is done by means of handles and screws which slide the ploughs from one side of the frame to the other; the last is effected by hoisting the frame itself with a chain and lever suspended to a strong wooden gallows. The top-bar of the gallows is made slanting, and the chain is hung to a roller travelling upon the bar, so that when the plough is lifted it runs down of its own accord into its required place upon the unploughed land. Of course there is a hoisting apparatus at each end of the work. When the plough is ready for returning the engine at the end where it is gives a whistle as a signal for the other to start.

In order to allow room for the ploughs to slide before and behind each other, the frame is of great length, viz., about 18 feet with the handles; and it is consequently very hard work to guide it. The work is not likely to be so well laid, therefore, as farmers in general would wish; but that which I inspected being cross-ploughing for fallows, I cannot pronounce upon the point. Perhaps two ploughs instead of three in one frame would be more manageable: this plan was formerly adopted, but then, instead of the sidelong shifting of the two, there were additional ploughs lifted out of or lowered into work by rack-and-pinion. The ingenuity displayed in the contrivance of the implement cannot be shown without drawings; but considerable improvements must still be made before it will answer its purpose; as it now occasionally masters its attendants, sometimes tumbling over, and playing other tricks. Light land it will plough pretty well; but tough clays occasion it some trouble. My impression certainly is, that some less cumbersome contrivance than this long implement—little less than *a ton* in weight—may be yet invented. The present draught must be enormous.

Then the chain used for drawing: why, I had expected to find a *wire-rope* in use, after the wonders done with it by Fowler's draining-engine. But the present barrels upon the engines are only a few inches in diameter—too small to wind a wire rope on. I believe that the power wasted in simply drawing the chain is never less than four horses—increasing with the wetness and stickiness of the land it passes over; while, in spite of the clever mechanism for grinding the coils evenly upon the barrel, links are continually catching, and the chain thereby jerking and damaging the engine, so that a day seldom passes without a breakage of more or less importance.

Looking at the engines themselves, I found that the chain-barrels were worked by means of cranks and parallel connecting-rods from eccentrics upon the fly-wheel shaft. Cog-wheel gearing was first employed, then, for convenience, cranks were substituted, with parallel connecting-rods; and now the whole power of the engines is applied through these eccentrics, with an immense amount of friction and diminution of the effective force. I saw at once, therefore, that Lord Willoughby's steam-plough, while demonstrating the possibility of doing what many people have doubted, must not be taken as exemplifying the economical conditions of the operation. Until a wire-rope is employed to drag a lighter form of implement, and the engines are made to turn the drums with greater mechanical efficience, it will not do to calculate the prospects of steam-ploughing from the fact that Lord Willoughby's two engines of 24-horse power each (at more than 100 lbs. pressure), can plough only 4 acres per day.

They have worked for weeks at a time—though generally hindered from day to day with accidents—and their greatest achievement has been to plough 4 acres in a day at a working expense of 35*s.*, employing at least six men. When the number of horses required to carry the apparatus to and from the field, and the incomplete state of the machine itself, are considered, it is not surprising that the neighbouring farmers regard it with distrust, and even ridicule; and that instead of being regularly in work, it is only brought out for special occasions, and for satisfying the curiosity of inquirers. As each engine weighs about 5 tons, three horses are required to draw it—two horses are required for the two tenders and the various tackle; one horse for the plough, which is carried by a "gin," such as timber is borne with; and a man and a horse are kept busy in fetching water and coke for the engines. I heard of one gentleman so taken with the invention, that he actually had two engines constructed like these; but private matters have since prevented his further engagement in it.

In conclusion, my opinion is, that much greater things yet remain to be done with a steam-plough, and this, too, with a single engine, and a better method of anchoring a pulley. Perhaps Lord Willoughby will be able to accomplish this, and so lessen the expense of working, as well as lower the first cost of his apparatus. I may just add that plates and wood-cuts of the steam-plough, with descriptive letter-press, appeared in the *Artisan* for July, 1853, and May, 1854. *Cultor.*

Home Correspondence.

Blue Vitriol for Steeping Wheat.—In answer to your correspondent, "J. C. C.," I can only say that I have used blue vitriol on Wheat for about eight years, and I believe my brother has used it nearly twenty years, and have never seen it damage the corn, but I cannot warrant that it would not do so if used in too large quantities, and if the corn was suffered to remain too long in the wash: we only leave it one night in steep. I really believe, from the description your correspondent "J. C. C." gives of his Wheat, that it must have malted in the ground. I have had this happen to my corn in Canada, where it is not an uncommon thing; in fact, the heat of the vitriol may have assisted the malting effects of the hot dry earth; for in Canada, if you sow Wheat in very dry weather, perhaps after a slight shower the corn begins to vegetate, and if it again sets in dry, it positively malts in the ground. I have been very much puzzled this year to account for the failure of about three quarters of an acre of ground sown in a three acre field of Wheat, and was at first inclined to put it down to the account of paring and burning, until I saw in your Paper that Wheats had failed on light lands: I then put down my failure to about 300 cart-loads of head-land earth, carried out in over zeal for the good of the crop. *B. M. T., Foxdown, Bideford, Devon.*

——On reading the statement of your correspondent "J. C. C." of the suspected failure of his Wheat crop from the use of blue vitriol as a dressing for the seed previous to sowing, I was involuntarily led to a review of my own practice during a long period of years, when, after trying various ingredients as preventives of smut, I settled down to this as not only the most effective, but the safest antidote to this hateful disease. So strongly am I impressed in its favour that I always maintained, and still continue to maintain, that no farmer need have smutty Wheat except through his own negligence in preparing the seed for the drill, dibble, or broadcast. But "J. C. C." objects to it as endangering the germination of the seed, and, in fact, destroying his crop; a serious charge if true, and one which ought not to be made but on good and sure foundations. I for one, at least, am not disposed to rest satisfied without further inquiry as to the strength of the solution, length of time occupied in the immersion of the seed, and various other particulars, of which as yet we are ignorant; for "J. C. C.'s" expression "dressing in the usual way" is far too vague not to require further explanation. What is "the usual way?" I protest I know not; and shall thankfully await information thereupon. I know what my own "usual way" was—not on a very small scale neither—but to the extent of 50 to 60 acres annually. For the accuracy of the operation I can vouch, always making a point of having it conducted under my own eyes, and very often with my own hands. To prove that I wish not to ask for more than I am perfectly willing to impart myself, I beg to submit the following as my "usual way" of preparing seed Wheat, in the firm conviction that if carefully and thoroughly carried out there need be no apprehension of failure. For I may here add that a vast deal more depends on strict attention to the minutiæ of this, as of most other agricultural operations, whether practical or merely experimental, than many, otherwise excellent farmers, may be disposed to think necessary. It is not enough to give general directions to a bailiff or yard-man, that you wish your seed Wheat prepared after such and such a recipe—you must see to it yourself; and even assist at the most important points by your own personal exertions. I say this without meaning the least disparagement of either the care or judgment of your overlooker; who, when once in possession of your plan of operations (only to be obtained directly from yourself) may, and ought, if conscientious and active, to be trusted to do in your absence what he is fully aware would have been done had you been present. But we must get on, or our steep will never be ready for the drill. Take then a tub or vessel of convenient form for holding 3 bushels of Wheat, and a space of some 6 or 8 inches beyond, for skimming, washing, and stirring. Place this tub over a wider but shallower vessel, similar to the underback of a mash-tub; into which the Wheat, when washed and skimmed, may, by a cock or other means, be drawn off from the tub above. But we are forestalling matters. Prepare the steep as follows:—Dissolve about 3 lbs. of blue vitriol in water (hot if wanted for immediate use, otherwise this is immaterial); to this add water enough fairly to swim the quantity of seed you intend to steep—say 3 bushels; into this liquor then sift gradually and lightly, by means of what in some places is called a reeing sieve, the Wheat as above mentioned. The heavy grain will fall to the bottom, leaving the lighter portion, seeds of certain weeds, smut balls (if any), and other rubbish, to float at the top. These must all be carefully skimmed off, and the main body of the Wheat below well stirred from the bottom, to make sure that the whole is thoroughly washed and skimmed. This process over, some recommend a prolonged immersion in the liquid of from one to three or more hours; but I never could see any necessity for this. In the first place its adoption would be attended with great additional inconvenience, to say nothing of the extra expense, from the necessary enlargement of the apparatus for steeping and washing a much larger quantity at a time than I have named. As soon, therefore, as you are satisfied that the washing, skimming, &c., is accomplished, and the liquor drawn off into the underback, empty the Wheat on to the floor, which latter ought to be thoroughly washed and cleaned between the steeps, and, after spreading it about a little, sift over it enough hot slacked lime to facilitate the progress of drying. The Wheat will be fit for drilling or sowing in a few hours, but if even delayed for a day or two will take no harm. The same liquor will serve several steeps, merely replenishing with fresh water and about ½ lb. of blue vitriol to each succeeding bushel of Wheat. Such was my practice during many years of my farming life, nor did I ever experience any failure of plant from the use of this steep, though I certainly have from chamberlye applied too strong and immersed too long. How to account for "J. C. C.'s" failure I know no more than he does; but as he says it was sown when the ground was dry, is it not as fair to presume that the failure was quite as likely to have been occasioned by want of the requisite moisture to cause the seed to germinate properly as by anything in the composition of a steep in such universal use, and, with common care, so harmless as a solution of blue vitriol, even though much stronger than I applied it? *S. Taylor, Gloucester.*

How are we to find Food for our Flocks.—This important query is answered in your Paper of April 28 by Mr. J. Ford, North Wales, who recommends the culture of "Chivas's Orange Jelly Turnip." If this should meet his eye, would he be kind enough to reply to the following:—What time of the year was the seed sown? Was it grown upon "fallow," or on land from which a crop had just been taken? How many tons of sound

bulbs per acre were drawn about the 20th of April? His being as accurate as possible in his replies will greatly oblige *A Subscriber*.

Societies.

ROYAL AGRICULTURAL OF ENGLAND.

Weekly Council, *May* 9.—Mr. Raymond Barker, V.P., in the chair.

Special Council, *May* 9: Mr. Miles, M.P., President, in the Chair.

Journal.—The President reported from the Journal Committee a schedule of the subjects proposed for the Prize-Essays of next year; and the following recommendation in reference to the editing of the Journal during Mr. Pusey's lamented indisposition: namely,—

"That Mr. Thompson be requested to accept the office of Chairman of the Journal Committee, and that Mr. Acland and Mr. Hoskyns be requested to accept the office of Vice-Chairmen: the Editorship of the Journal to be confided to those three gentlemen, with whom the Journal Committee will co-operate."

This report was adopted by the Council.

Poultry Steward.—The Hon. and Rev. Stephen Willoughby Lawley, of Escrick Rectory, near York, was requested by the Council to accept the appointment of Steward of the Poultry department at the Carlisle meeting.

Management of Dairy-Cattle.—The following communication was read from Mr. Horsfall, of Burnley Hall, near Otley, Yorkshire.

"Burnley Hall, near Otley, May 5.

"In complying with the request of your honourable Council to supply information regarding my treatment of cows for dairy purposes, it seems pertinent that I should enter into some explanation of the motives and considerations which influence my conduct in this branch of my farm operations. I have found it stated, on authority deserving attention, that store cattle of a fair size, and without other occupation, maintain their weight and condition for a length of time, when supplied daily with 120 lbs. of Swedish Turnips and a small portion of straw. The experience of the district of Craven, in Yorkshire, where meadow hay is the staple food during winter, shows that such cattle maintain their condition on 1½ stone of meadow hay each per day. These respective quantities of Turnips and of hay correspond very closely in their nutritive properties; they contain a very similar amount of albuminous matter, starch, sugar, &c., and also of phosphoric acid. Of oil—an important element, especially for the purpose of which I am treating—the stated supply of meadow hay contains more than that of Turnips. If we supply cows in milk of the same size with a like quantity of similar food, they will lose perceptibly in condition. This is easily explained when we find their milk rich in substances which serve for their support when in store condition, and which are shown to be diverted in the secretion of milk. In the neighbourhood of towns where the dairy produce is disposed of in new milk, and where the aim of the dairyman is to produce the greatest quantity, too frequently with but little regard to quality, it is their common practice to purchase in or near calving cows; they pay great attention to the condition of the cow: they will tell you, by the high comparative price they pay for animals well stored with flesh and fat, that condition is as valuable for them as it is for the butcher; they look upon these stores as materials which serve their purpose; they supply food more adapted to induce quantity than quality, and pay but little regard to the maintenance of the condition of the animal. With such treatment, the cow loses in condition during the process of milking, and when no longer profitable, is sold to purchasers in farming districts where food is cheaper, to be fattened or otherwise replenished for the use of the dairy keeper. We thus find a disposition in the cow to apply the aliment of her food to her milk, rather than to lay on flesh or fat, for not only are the elements of her food diverted to this purpose; but to all appearance her accumulated stores of flesh and fat are drawn upon, and converted into components of milk, casein, or butter. It is also probable that a like result will take place in regard to her bones, if a due supply of phosphate be not afforded in her food. As I am differently circumstanced, a considerable portion of my dairy produce being intended for butter, for which poor milk is not adapted, and as I fatten not only my own cows, but purchase others to fatten in addition, my attention was given to devise food for my milch cows adapted to their maintenance and improvement, and with this view I was led to give attention to the composition of milk. From several analyses I have selected one by Haidlen, which I find in publications of repute. Taking a full yield of milk, 4 gallons per day, which will weigh upwards of 40 lbs., this analysis assigns to it of dry material 5.20, of which the proportion with sufficient accuracy for my purpose consists of—

	lbs.
Pure casein	2.00
Butter	1.25
Sugar	1.75
Phosphate of lime }	.09
Chloride of potassium, And other mineral ingredients }	.11
	5.20

It appeared an object of importance, and one which called for my particular attention, to afford an ample supply of the elements of food suited to the maintenance and likewise to the produce of the animal, and that if I omitted to effect this, the result would be imperfect and unsatisfactory. By the use of ordinary farm produce only, I could not hope to accomplish my purpose. Turnips are objectionable on account of their flavour, and I seek to avoid them as food for dairy purposes. I use Cabbages, Kohl Rabi, and Mangold Wurzel, yet only in moderate quantities. Of meadow hay it would require beyond the supply necessary for the maintenance of the cow an addition of fully 20 lbs. to supply the casein in a full yield of milk 16 quarts, 40 lbs. to supply the oil for the butter, whilst 9 lbs. seem adequate for the supply of the phosphoric acid. You cannot then induce a cow to consume the quantity of hay requisite for her maintenance, and for the full yield of milk of the quality instanced. Though it is a subject of controversy whether butter is wholly derived from vegetable oil, yet the peculiar adaptation of this oil to the purpose will, I think, be admitted. I had, therefore, to seek assistance from what are usually termed artificial feeding substances, and to select such as are rich in albumen, oil, and phosphoric acid, or phosphate of lime; and I was bound, also, to pay regard to their comparative cost, with a view to profit, which when farming is followed as a business is a necessary, and in any circumstances, an agreeable accompaniment. I think it will be found that substances peculiarly rich in nitrogenous or other elements have a higher value for special than for general purposes, and it seems to me not improbable that this adaptation of materials characterised by peculiar properties to special purposes has not yet gained the attention to which it is entitled. I have omitted all reference to the heat supplying elements, starch, sugar, &c. As the materials commonly used as food for cattle contain sufficient of these to effect this object, under exposure to some degree of cold, I have a right to calculate on a less consumption of them as fuel, and consequently a greater surplus for deposit as sugar, and probably also as fat, my stalls being kept during winter at a temperature of nearly 60°. I now proceed to describe the means I am using to carry out the purposes which I have sought to explain. My food for milch cows, after having undergone various modifications, has for two seasons consisted of Bean-straw, Oat-straw, and shells of Oats in equal proportion, Rape-cake 5 lbs., and Bran 2 lbs. per day for each cow; these materials are blended together, moistened, and well steamed; they are supplied three times, *ad libitum*, per day in a warm state. The attendant is allowed 1 lb. to 1½ lb. per cow, according to circumstances, of Bean-meal, which he is charged to give to each cow in proportion to the yield of milk, those in full milk getting 2 lbs. each per day, others but little; it is mixed with the steamed food on its being dealt out separately; when this is eaten up, green food, consisting of Cabbages, from October to December, Kohl Rabi till February, and Mangold till Grass time. With a view to nicety of flavour, I limit the supply of green food to 30 to 35 lbs. per day for each. After each feed 4 lbs. of meadow hay, or 12 lbs. per day is given to each cow; they are allowed water twice per day to the extent they will drink. As some of these materials are not commonly used as food, I may be allowed some observations on their properties. Bean-straw uncooked is dry and unpalatable; by the process of steaming it becomes soft and pulpy, emits an agreeable odour, and imparts flavour and relish to the mess. For my information and guidance I obtained an analysis of Bean-straw of my own growth, on strong and high-conditioned land; it was cut on the short side of ripeness, but yielding a plump Bean. The analysis by Professor Way shows a percentage of—

Moisture of	14.47	Brought forward ...	58.92
Albuminous matter ...	16.38	Starch, gum, &c. ...	31.63
Oil or fatty matter ...	2.23	Mineral matters ...	9.45
Woody fibre	25.84		
Carried forward ...	58.92	Total	100

In albuminous matter, which is especially valuable for milch cows, it has nearly double the proportion contained in meadow hay. Bran also undergoes a great improvement in its flavour by steaming, and it is probably improved in its convertibility as food; it contains about 14 per cent. of albumen, and is peculiarly rich in phosphoric acid, nearly 3 per cent. of its whole substance being of this material. The properties of Rape-cake are well known; the published analyses give it a large proportion (nearly 30 per cent.) of albumen; it is rich in phosphate and also in oil. This is of the fluid or elain class of vegetable oils, and it is to its elain property that I call particular attention. Chemistry will assign to this material, which has hitherto been comparatively neglected for feeding, a first place for the purpose of which I am treating. If objection should occur on account of its flavour, I have no difficulty in stating that by the preparation I have described I have quite overcome this. I can easily persuade my cattle (of which 60 to 80 pass through my stalls in a year,) without exception to eat the requisite quantity. Nor is the flavour of the cake in the least perceptible in the milk or butter. During May, my cows are turned out on a rich pasture near the homestead; towards evening they are again housed for the night, when they are supplied with a mess of the steamed mixture and a little hay each morning and evening. During June, when the Grasses are better grown, mown Grass is given to them instead of hay, and they are also allowed two feeds of steamed mixture. This treatment is continued till October, when they are again wholly housed. The results which I now proceed to relate are derived from observations made with the view of enabling me to understand and regulate my own proceedings. For some years back I have regularly weighed my feeding stock, a practice from which I am enabled to form a more accurate estimate of their doings than I could previously pretend to. In January, 1854, I commenced weighing my milch cows; it has been shown by what I have premised that no accurate estimate can be formed of the effect of the food on the production of milk, without ascertaining its effect on the condition of the cows. I have continued this practice once a month almost without omission up to the date of this. The weighings take place early in the morning and before the cows are supplied with food; the weights are registered, and the length of time (15 months) during which I have observed this practice enables me to speak with confidence on the results. The cows in full milk yielding 12 to 16 quarts each per day vary but little, some losing, others gaining, slightly; the balance in the month's weighing of this class being rather to gain. It is common for a cow to continue a yield from six to eight months before she gives below 12 quarts per day, at which time she has usually, if not invariably, gained weight. The cows giving less than 12 quarts, and down to 5 quarts per day, are found when free from ailment to gain without exception. This gain, with an average yield of nearly 8 qts. per day, is at the rate of 7 to 8 lbs. per week each. My cows in calf I weigh only in the incipient stages, but they gain perceptibly in condition, and consequently in value; they are milked till within 4 to 5 weeks previous to calving. I give the weights of 3 of these, and also of one heifer, which calved in March:—

No.		1854				1855				Gain.
			cwt.	qr.	lbs.		cwt.	qr.	lbs	lbs.
1	Bought, and weighed ...	July	10	1	20	April	11	3	0	148
2	" "	"	8	2	10	"	10	2	0	214
3	" "	"	8	2	0	"	10	0	0	184
4	Heifer, which calved also in March, weighed ...	"	7	0	0	"	9	3	0	300

These observations extend over lengthened periods on the same animals, of from 30 to upwards of 50 weeks; a cow, free from calf and intended for fattening, continues to give milk from 10 months to a year after calving, and is then in a forward state of fatness, requiring but a few weeks to finish her for sale to the butcher. It will thus appear that my endeavours to provide food adapted to the maintenance and improvement of my milch cows are attended with success. On examining the composition of the ordinary food which I have described, straw, roots, and hay, it appears to contain the nutritive properties which are found adequate to the maintenance of the animal; the extra food will supply the albumen for the casein, it is deficient in oil for the butter, whilst it will supply in excess the phosphate of lime for a full yield of milk. If I take the class of cows giving less than 12 quarts per day, and taking also into account a gain of flesh, 7 to 9 lbs. per week, though I reduce the quantity of extra food by giving less of the Bean-meal, yet the supply will be more in proportion than with a full yield; the surplus of nitrogen and phosphoric acid, or phosphate of lime will go to enrich the manure. And here I cannot omit to remark on the satisfaction I derive from the effects of this treatment on the fertility of the land in my occupation. My rich pasture lands are not tending to impoverishment but to increased fertility; their improvement in condition is apparent. A cow in full milk giving 16 quarts per day, of the quality analysed by Haidlen, requires, beyond the food necessary for her maintenance, 6 to 8 lbs. per day of substances containing 20 to 25 per cent. of protein. A cow giving on the average 8 quarts per day, with which she gains 7 to 9 lbs. per week, requires 4 to 5 lbs. per day of substances rich in protein beyond the food which is necessary for her maintenance. Experience of fattening gives 2 lbs. per day, or 14 lbs. per week, as what can be attained on an average and for a length of time. If we consider ½ lb. per day as fat, which is not more than probable, there will be 1½ lb. for flesh, which, reckoned as dry material, will be about ½ lb; which is assimilated in increase of fibrine and represents only 1½ to 2 lbs. of substances rich in protein beyond what is required for her maintenance. If we examine the effects on the fertility of the land, my milch cows, when on rich pasture, and averaging a yield of nine quarts per day, and reckoning one cow to each acre, will carry off in 20 weeks 25 lbs. of nitrogen, equal to 30 of ammonia. The same quantity of milk will carry off 7 lbs. of phosphate of lime in 20 weeks from each acre. A fattening animal giving flesh at the rate I have described will carry off about one-third of the nitrogen equal to about 10 lbs. of ammonia, as compared with the milch cow whilst if full grown it will restore the whole of the phosphate. It is worthy of remark that experience states that rich pastures used for fattening fully maintain their fertility through a long series of years. If these computations be at all accurate, they tend to show that too little attention has been given to the supply of substances rich in nitrogenous compounds in the food for our milch cows, whilst we have laid too much stress on this property of such substances in food for fattening cattle. They tend also to the inference that in the effects on the fertility of our pastures used for dairy purposes, we derive advantage not only from the phosphate of lime but also from the gelatine of bones used as manure. On comparing the results from my milch cows fed in summer on rich pasture, and treated at the same time with extra food as I have described, with their treatment on winter food, and whilst wholly housed, and taking into account the yield of milk and the gain of weight, I find these from stall-feeding fully equal to those from depasture. The cows which I buy as strippers, for fattening, giving little milk, from neighbouring farmers who use ordinary food, Turnips without straw or hay, and coming under my treatment, increase their yield of milk, until after a week or two they give 2 quarts per day more than when they came, and that too of a much richer quality. I sometimes observe in the weekly publications which come under my notice accounts of cows giving large quantities of butter; these are usually, however, extraordinary instances and not accompanied with other statistical information requisite to their being taken as a guide, and it seldom happens that any allusion is made to the effects of the food on the condition of the animals, without which no accurate estimate can be arrived at. On looking over several treatises to which I have access, I find the following statistics on dairy produce:—Mr. Morton, in his "Cyclopædia of Agriculture," page 621, gives the results of the practice of a Mr. Young, an extensive dairy-keeper in Scotland. The yield of milk per cow is stated at 680 gallons per year; he obtains from 16 quarts of milk 20 ozs. of butter, or for the year, 227 lbs. per cow; from 1 gallon of cream 3 lbs. of butter, or 12 ozs. per quart. Mr. Young is described as a high feeder; Linseed is his chief auxiliary food for milch cows. Professor Johnstone, "Elements of Agricultural Chemistry," gives the proportion of butter from 16 quarts of milk at 1½ oz. per quart, or from 16 quarts 24 oz., the produce of four cows of different breeds—Alderney, Devon, and Ayrshire, on pasture and in the height of the summer season. On other four cows of the Ayrshire breed he gives the proportion of butter from 16 quarts as 16 oz., being 1 oz. per quart. These cows were likewise on pasture. The same author states the yield of butter as one-fourth of the weight of cream, or about 9 oz. per quart. Mr. Rawlinson, Journal of the Royal Society, No. 29, Vol. 1, 1852, gives the produce of 20,110 quarts of milk churned by hand as 1109 lbs. of butter, being at the rate of fully 14 oz. per 16 quarts of milk, and from 23,156 quarts of milk 1525 oz. of butter, being from 16 quarts nearly 16¾ oz. of butter. The same author states that the yield of butter derived from five churnings of 15 quarts of cream each, is somewhat less than 8 oz. per quart of cream. Dr. Muspratt, in his work on the "Chemistry of Arts and Manufactures," which is in the course of publication, gives the yield of butter from a cow per year in Holstein and Lunenberg, at 100 lbs., in England at 160 lbs to 180 lbs. The average of butter from a cow in England is stated to be 8 oz. or 9 oz. per day, which on a yield of 8 to 9 quarts is 1 oz. per quart, or for 16 quarts 16 oz. The quantity of butter derived from cream is stated as one-fourth, which is equal to about 9 oz. per quart. The richest cream of which I find any record is that brought to the Royal Society's meeting during the month of July, for the churns which compete for the prize. On referring to the proceedings of several meetings I find that 14 oz. per quart of cream is accounted a good yield. I have frequently tested the yield of butter from a given quantity of my milk; as my dairy produce is partly disposed of in new milk, partly in butter and old milk, it became a matter of business to ascertain by which mode my dairy produce gave the best return. I may here remark that my dairy practice has been throughout on high feeding, though it has undergone several modifications. My mode of ascertaining the average yield of butter from milk is to measure over the milk from churning day to churning day, and compute the relative proportions. The results have varied from 24 to 27¼ oz. from 16 quarts of milk; I therefore assume in my calculation 16 quarts of milk as yielding a roll (25 oz.) of butter. As I have at times a considerable number of cows bought on as strippers, and fattened as they are milked, which remain sometimes in my state eight or nine months, and yield towards the close but 5 quarts per day. I am not enabled to state with accuracy and from ascertained data the average yield per year of my cows kept for dairy purposes solely. However, from what occurs at Grass time when the yield is not increased, and also from the effects of my treatment on cows which I buy on, giving a small quantity, I am fully persuaded that my treatment induces a good yield. I may here observe that I pay great attention to the temperature of my dairy, which I use means of keeping at 52° to 55°, my milk being allowed to stand 36 hours. As the yield of butter from a given quantity of cream is not of such particular consequence, I have not given equal attention to ascertain their relative proportions. I have a recollection of having tested this on a former occasion, when I found 14 to 16 oz. per quart, but cannot call to mind under what treatment this took place. On questioning my dairywoman, in December, 1854, as to the proportion of cream and butter, she reported nearly one roll of 25 oz. of butter to one quart of cream. I looked upon this as a mistake. On its accuracy being persisted in, the next churning was carefully observed, with a like proportion. My dairy cows averaged then a low range of milk as to quantity—about 9 quarts each per day: six of them, in a forward state of fatness, were intended to be dried for finishing off in January; but owing to the scarcity and consequent dearness of calving cows, I kept them on in milk till I could purchase cows to replace them, and it was not till February that I had an opportunity of doing so. I then bought four cows within a few days of calving; they were but in inferior condition, and yielded largely of milk. Towards the close of February and March, four of my own dairy cows, in full condition, likewise calved. During March, three of the six which had continued from December were selected by the butcher as fit for his purpose; the other three were dried at the close of March, and are now on hand in a saleable condition. Each churning throughout was carefully observed, with a similar result, varying but little from 25 oz. of butter per quart of cream—on Monday, April 30, 16 quarts of cream having yielded 26 rolls (of 25 oz. each) of butter. Though I use artificial means of raising the temperature of my dairy, by the application of hot water during cold weather, yet my service-pipes being frozen in February, I was unable to keep up the temperature, and it fell to 45°. Still my cream, though slightly affected, was peculiarly rich, yielding 22 oz. of butter per quart. Throughout April the produce of milk from my 15 dairy cows averaged full 160 quarts per day. My cows are bought in the neighbouring markets with a view to their usefulness and profitableness. The breeds of this district have a considerable admixture of the short-horn, which is not noted for the richness of its milk. It will be remarked that during the time these observations have been continued on the proportion of butter from cream, more than one-half of my cows have been changed. Having thus satisfied myself that the peculiar richness of my cream was due only to the treatment of my cows which I have sought to describe, it occurred to me that I ought not to keep it to myself; it appeared to me that these results of my dairy practice afforded matter of interest for the investigation of those who cultivate science, the physiologist and the chemist. Though my pretensions to acquirements in their instructions are but slender, the results are such as enable me to acknowledge benefit in seeking to

regulate my proceedings by their rules. I was thus led to address the note to Professor Way, whose valuable time I should be careful not to occupy with unworthy matter, suggesting, that if he thought proper, he might bring the subject under the notice of your honorable Council. In taking off the cream I use an ordinary shallow skimmer of tin perforated with holes, through which any milk gathered in skimming escapes. It requires care to clear the cream, and even with this some streakiness is observable on the surface of the skimmed milk. The milk bowls are of glazed brown earthenware, common in this district; they stand on a base of 6 or 8 ins., and expand at the surface to nearly twice that width. Four to five quarts are contained in each bowl, the depth being 4 to 5 inches at the centre. The churn I use is a small wooden one, worked by hand, on what I suppose to be the American principle. I obtained it from Messrs. Dray and Co. I have forwarded to Professor Way a small sample of butter for analysis; 15 quarts of cream were taken out of the cream jar, and churned at three times in equal portions—

The first 5 quarts of cream gave	... 127	oz. of butter
The second 5 " "	... 125	" "
The third 5 " "	... 120½	" "
	372½	

At a subsequent churning of 14 quarts of cream—

The first seven gave 7 rolls or ...	... 175	oz. of butter.
The second seven gave 7 rolls 2 oz., or...	177	oz. "
	352	oz. "

On testing the comparative yield of butter and of butter-milk, I find 70 per cent. of butter to 30 per cent. of butter-milk, reversing the proportions given in the publications to which I have referred. The churnings usually occupy half-an-hour, at a temperature of 52°. Having now, as far as I can recollect, supplied every particular of information, I shall look with interest to the discussion on this subject, which, as I observe from the papers, is likely to take place at your next meeting. Since the foregoing was written I have received from Professor Way another analysis of the butter sent to him; it is found to contain:

Pure fat or oil	82.70
Casein or curd	2.45
Water, with a little salt	14.85
Total	100.00

The only analyses of this material which I find in the publication in my hand are two by Professor Way, in the Journal of the Royal Society, vol. xi. part 11, on butter by the common and by the Devonshire method; the result in 100 parts being—

	Raw.	Scalded.
Pure butter	79.72 ...	79.12
Casein, &c.	3.38 ...	3.37
Water	16.90 ...	17.51
Total	100.00 ...	100.00

—*Thomas Horsfall.*

On the motion of the Hon. A. Leslie Melville, seconded by Mr. Hoskyns, the thanks of the Council were voted to Mr. Horsfall for the favour of this communication. Mr. Woodward and Mr. Gadesden fully confirmed, by their own experience, the value of Mr. Horsfall's system of dairy management.—Prof. Way referred to the chemical principles connected with the assimilation of food of different character given to milch cows. Mr. Scott furnished valuable evidence of the improvements effected by him in reference to dairy management in Ireland; and his intention to draw up a statement of the details for the information of the Council. The Rev. Mr. Black, of Otley, favoured the Council with his attendance, and on the part of Mr. Horsfall offered explanations on such points of the communication then read to the Council as the members required.

Reviews.

Small Farms, and how they Ought to be Managed. By Martin Doyle. G. Routledge & Co., Farringdon Street.

This little book contains chapters on farm offices, implements, and enclosures, all of which may be classed together; on the management of the soil, under the headings draining, subsoiling, rotation, paring and burning, and manures; on the culture of crops and management of live stock, and it concludes with a calendar of operations. It is instructive and generally trustworthy, besides being well packed and arranged—and the whole is just such a book of rules and instructions as we are being continually asked for.

Calendar of Operations.

MAY.

Northumberland Farm, *May* 9.—During the month of April, and indeed until yesterday, the weather has been exceedingly dry and cold, the ice in the mornings being frequently a quarter of an inch thick. Yesterday we had a considerable fall of rain, which, though cold, has refreshed us greatly. The long storm threw labour a full month back, and the continuance of cold weather since the snow left has prevented vegetation making up its lee-way. There was little sowing till the last week of March, when from the long frost land ploughed previous to its commencement required very little of the harrow. Spring corn was never, we believe, got into the ground in better order, and had the weather been genial would soon have made up for lost time, but there is now every appearance of a late harvest. The dry weather has favoured the clearing of fallows, where farmers have been able to overtake their work so far as to get at them. Potato planting is now pretty generally got through. Turnips are mostly consumed, and sheep and grazing cattle are turned on Grass. Stock markets are rather heavy from the quantity of cattle and sheep, especially the former, coming out at this time; but corn markets keep brisk. *Tynemouth.*

Notices to Correspondents.

Ayrshire Cows: *W P P.* We have received your own and several other announcements of cattle for sale. We must, however, refer them for publication to the advertising columns of the Paper.

Mangold Wurzel: *Brixton.* Turn the heap over, and break the growths off the bulbs; they will soon become worthless if suffered to grow. The sooner they are consumed now the better.

Non-Phosphated Carbon, or Blood Manure: *J H.* The two companies are distinct. The one referred to the other week has been advertising in our columns.

Sea Farm: *P Q C.* We shall endeavour to overtake arrears on this subject in a week or two.

Swedish Turnips: Sow from the middle of May in the north of England and Scotland, and from the first of June in England.

RICHMOND & CHANDLER'S PATENT CHAFF CUTTING MACHINE.

All the various modern Implements of Agriculture manufactured on the most scientific and improved principles, suitable for home use and exportation.—Address, Richmond & Chandler, Salford, Manchester; and 32, South John Street, Liverpool.

☞ Catalogues Gratis.

PARKES' STEEL DIGGING FORKS & DRAINING TOOLS.

Messrs. Burgess and Key, as Mr. Parkes' Wholesale Agents for England, have always in stock a large assortment. These Forks and Tools are now in use by upwards of 1000 of the Nobility and Farmers, members of the Royal Agricultural Society, who pronounce them to be the best ever invented, and to facilitate labour at least 20 per cent. Price Lists sent free on application, and Illustrated Catalogue of the best Farm Implements, on receipt of eight postage stamps.

Moore's Patent Ventilator, for every Description of Farm-Buildings, Conservatories, Hot-houses, Warehouses, Market-houses, Bell-turrets, also for Ventilating Shafts, &c.

These Ventilators are fitted to side-slips of wood with iron levers, iron flanges, and brass screws, with rough plate, or 32 oz. sheet glass, at 4*s.* per foot super. 2*s.* 6*d.* extra for necessary fittings to each Ventilator. If with brass levers in place of iron, 4*s.* per pair extra. It is presumed the accompanying drawing of a Greenhouse will show the advantages obtained (independent of a most perfect system of Ventilation, by admitting any amount of fresh air and distributing equally over the plants, &c., and at the same time emitting the vitiated), viz., a much neater appearance, and an uninterrupted view of the whole interior. Greenhouses at Mr. James Veitch, Jun., Exotic Nursery, King's Road, Chelsea; Messrs. Veitch & Sons, Nursery, Exeter; Messrs. Messrs. Perry, Nursery, Banbury; and the Pleasure Grounds at Hampton Court Palace; having been fitted with these Ventilators with perfect success, the Patentee has obtained permission to refer to the above places all parties desirous of seeing the same.

These Ventilators have been applied to many other Greenhouses, Conservatories, &c., but they are not published, in order to avoid giving unnecessary trouble. Fifty-four of these Ventilators, 5 ft. square (34 on the roof at an angle of 60 degrees), have been fitted at Her Majesty's Saltpetre Works, Waltham Abbey; the success of which has been proved by the fact, that the saltpetre is crystalised in little more than half the time, previously to the light and ventilation obtained by the adoption of these Ventilators.

Moore's double-current Ventilators for External Walls, &c. Ventilators for every description of apartment, from the Cottage to the Palace. Stained and Ornamental Glass if required. In taking the size, the exact opening should be given, stating the height and width distinctly. Tariff Prices of the ordinary Ventilators may be had on application at either of the above addresses. Packing cases allowed full price when returned free.

N.B.—These Ventilators can be readily fitted to Greenhouses already erected, by removing the entire sashes and fixing the Ventilators in their places.

Perfect Ventilation in all Cases Guaranteed.

Church, Turret, Musical and House Clock Makers, to the Lords of the Admiralty, the Hon. Board of Ordnance, the Emperor of China, &c.

London: 81, Fleet Street, London.—Manufactory, Sekford Works, Clerkenwell.

WARNER'S IMPROVED LIQUID MANURE, OR GENERAL PORTABLE PUMP.

The valve is a ball of imperishable material, and cannot clog in action. The barrel is of galvanised iron, not likely to corrode, and can be raised or lowered at pleasure. The legs will fold together, and the whole may be carried on shoulder to any pond or tank required.

Price of 4½ in. Pump, with legs, 3*l.* 3*s.* The barrel is 27½ in. long, and the legs are 5 ft. high.

1½ inch Gutta Percha Suction Pipe 1*s.* 6*d.* per foot.

1½ inch Flexible Rubber and Canvas Suction Pipe, 3*s.* 6*d.* per foot.

May be obtained of any Ironmonger or Plumber in town or country, at the above prices, or of the Patentees and Manufacturers, John Warner & Sons, 8, Crescent, Jewin Street, London.

Every description of Machinery for Raising Water, by means of Wheels, Rams, Deep Well Pumps, &c.; also Fire and Garden Engines, &c.—Engravings sent on application.

WARNER'S PATENT VIBRATING STANDARD PUMPS.

PATENT CAST-IRON PUMPS, for the use of Farms, Cottages, Manure Tanks, and Wells of a depth not exceeding 30 feet.

Diameter of Barrel	Length of Barrel, under nose.		£	s.	d.
2½ in.	short 1 ft. 7 in.	Fitted for lead, gutta percha, or cast iron flanged pipe, as required.	1	12	0
2½ "	long 3 " 3 "		1	15	0
3 "	ditto 3 " 6 "		2	12	0
3½ "	ditto 3 " 6 "		2	18	0
4 "	ditto 3 " 6 "		3	5	0
2½ "	short, with 15 feet of Lead Pipe attached, and Bolts and Nuts ready for fixing		2	12	0
2½ in.	long ditto ditto	ditto	2	15	0

The short barrel Pump is very convenient for fixing in situations of limited height and space, for the supply of coppers and sinks in Wash-houses with soft water from underground tanks, or in Hot, Forcing, and Plant Houses; they may be fixed, when desired, under the stage.

May be obtained of any Ironmonger or Plumber in Town or Country, at the above prices, or of the Patentees and Manufacturers, JOHN WARNER AND SONS, 8, Crescent, Jewin Street, London.

Every description of Machinery for Raising Water, by means of Wheels, Rams, Deep Well Pumps, &c.; also Fire and Garden Engines, &c. &c.—Engravings sent on application.

JOHN WARNER AND SONS, Crescent, Jewin Street, London.

GALVANISED IRON TUB GARDEN ENGINE,

With Warner's Registered Spreader,

is strongly recommended, for durability and low price, viz., 2*l.* 19*s.*, to hold 10 gallons.

Larger sizes in wood or iron, viz., 14 gals., 24 gals., & 35 gals. May be obtained of any Ironmonger or Plumber in town or country, or of the Patentees and Manufacturers, as also Machinery of all kinds for raising Water from any depth to any height by Steam, Horse, or Manual Power. Prices sent on application. Syringes of various constructions and sizes from 9*s.* upwards. Metallic String from 5*d.* to 1*s.* 8*d.* per lb.

JOHN WARNER AND SONS, 8, Jewin Crescent, London, Manufacturers of FIRE ENGINES, PUMPS GARDEN ENGINES, and SYRINGES.

Brass Syringes, 9*s.* to 18*s.*

All articles of John Warner & Sons' manufacture may be obtained of any Ironmonger or Plumber in town or country, at the advertised prices.

John Warner & Sons having been practical Horticulturists for many years, know exactly the requirements of both Amateurs and Gardeners. A gardener with a properly constructed pump will get through as much work in five minutes as he could with any Syringe in a quarter of an hour, and with half the labour to himself. Syringes are economical for small houses.

No establishment offers such a variety of effective machines for hydraulic purposes, whether to supply Gardens, Hothouses, Cottages, Farms, Mansions, or Boards of Health, with every requisite connected with the conveyance and distribution of liquids.

Fountains suitable for Conservatories, Lawns, &c.

Sheets of Engravings sent on application.

STEPHENSON AND PEILL, 61, Gracechurch Street, London, and 17, New Park Street, Southwark, Manufacturers of Copper Cylindrical and Improved Conical Iron BOILERS, and Conservatory and Hothouse Builders, either in Wood or Iron, respectfully call the attention of the Nobility, Gentry, and Nurserymen to their simple but efficacious method of warming Horticultural and other Buildings by Hot Water.

From the extensive works they have executed, references of the highest respectability can be given, and full particulars furnished on application.

SPOONER'S PATENT WATER AND MANURE DRILL.—Manufacturers: Tasker & Fowle, Andover, Hants; and Garrett & Sons, Saxmundham, Suffolk, to whom orders may be sent; or to the Inventor and Patentee, W. C. Spooner, Eling, Southampton.

HORTICULTURE IN ALL ITS BRANCHES.

JOHN WEEKS & Co., King's Road, Chelsea,

HOTHOUSE BUILDERS.

THE NOBILITY AND GENTRY about to erect Horticultural Buildings, or fix Hot-water Apparatus, will find at our Horticultural Establishment and Hothouse Works, King's Road, Chelsea, an extensive variety of Hothouses, Greenhouses, Conservatories, Pits, &c., erected, and in full operation, combining all modern improvements, so that a lady or gentleman can select the description of House best adapted for every required purpose.

The HOT-WATER APPARATUS, which passes through all the Houses and Pits, affording both top and bottom heat, is in constant operation and particularly worthy of attention.

Many of the Houses and Pits are of wide and lofty dimensions, and together equal in length 1000 feet. They are all effectually heated by *one boiler*, which, during the severe winter months does not cost in labour and fuel more than 3*s.* 8*d.* per day, and the apparatus is so arranged that each House or Pit may be heated separately and to the required temperature. The splendid collections of Stove and Greenhouse Plants are also in the highest state of cultivation, and for sale at very low prices. Also a fine collection of strong Grape Vines in pots, from eyes, all the best sorts.

Plans, Models, and Estimates of Horticultural Buildings, also Catalogues of Plants, Vines, Seeds, &c., forwarded on application to John Weeks & Co., King's Road, Chelsea, London.

COTTAM AND HALLEN have on Show, at their Repository, No. 2, Winsley Street, Oxford Street, London, a great variety of the following articles for the Garden, &c., at very low prices, viz.:—Garden Rollers, Cast-Iron Rickstands, Garden Engines, Mowing Machines, Garden Chairs, Superior Garden Tools of all kinds, Garden Vases and Pedestals in great variety, and a large assortment of Horticultural and Agricultural Implements.

Ornamental Wire Flower Stands, Pot Trainers, Rose Tree Guards, Flower Bordering, and every description of Wire Work, both plain and ornamental.

Hand Glass Frames, Cast and Wrought Iron Flower Stakes, Garden Arches, &c.

Strong Iron Hurdles, and best Wire for Strained Wire Fencing.

Hothouses, Conservatories, &c., made upon the most improved principle, either of Iron, or of Iron and Wood combined, which can be fixed complete, with Hot Water Apparatus, in any part of the Kingdom.

Show Rooms at the Manufactory, 2, Winsley Street, Oxford Street, opposite the Pantheon, where every information may be obtained.

HORTICULTURAL WORKS AND HOT-WATER APPARATUS MANUFACTORY.

Kensal Green, Harrow Road, London.

JOHN TAYLOR AND SON beg to call the attention of the nobility and gentry to the very superior manner in which they Erect all kinds of Conservatories, Vineries, Greenhouses, &c., combining every improvement with elegance of design, and durability of materials and workmanship.

Their VENTILATING APPARATUS for the Fronts and Roofs of Houses has given the highest satisfaction. Churches, Chapels, Schools, Entrance Halls, Public Buildings, &c., heated with Hot-Water Apparatus in a most economical and efficient manner. J. T. & Son have great pleasure in referring to numbers of the nobility and gentry by whom they are extensively engaged.

BEE HIVES.

NEIGHBOUR'S IMPROVED COTTAGE BEE-HIVE, as originally introduced by George Neighbour & Sons, with all the recent improvements, glasses, thermometer, &c., price 35*s.*, securely packed for the country.

This unique hive has met with universal commendation, and may be worked with safety, humanity, and profit, by the most timid; its arrangements are so perfect, that the honey may be taken at any time of the gathering season without at all injuring the bees.

Early applications, addressed to Geo. Neighbour & Sons, 127, High Holborn, or 149, Regent Street, London, will receive prompt attention. Their newly arranged Catalogue of other improved Beehives, with Drawings and Prices, sent on receipt of two stamps.

Agents:—Manchester, Hall & Wilson, 50, King Street; Liverpool, James Cuthbert, 12, Clayton Square; Chester, F. & A. Dickson & Sons, 106, Eastgate Street; Glasgow, Austen & M'Aslan, 186, Trongate Street; Dublin, J. Edmundson & Co., 61, Dame Street.

WEIR'S IRRIGATORS, LIQUID MANURE PUMPS, FIRE AND GARDEN ENGINES.

WATER YOUR GARDENS WITH THE PATENT FLEXIBLE GUTTA PERCHA TUBING, from 4*d.* per foot. Roses, from 4*s.*

Union Joints, from 1*s.* 6*d.* each, fitted complete.

Instructions given to affix joints to Taps.

Post Office Orders payable at City Road Branch.

JAMES W. WATTS, Factory, 27, City Road, London.

GARDEN ENGINES, SYRINGES, &c.—CAUTION.—The well-known reputation of READ'S Engines, Machines, and Syringes, has led to the nefarious practice of placing Cards in Shop Windows, with the words "Read's Patent" over Syringes of the VERY COMMONEST DESCRIPTION. R. Read begs to Caution the Public against being deceived by such false representations, as many of these Instruments, upon trial, will be found defective and useless.—READ'S Instruments have the Royal Arms and address,

35, Regent Circus, London.

WEIR'S CANVAS HOSE PIPING, for Liquid Manure or Water, protected from rot.

1	1¼	1½	1¾	2	2½	2½	2¾	3 inches diameter.

FOR WATERING GARDENS.

HANCOCK'S IMPROVED VULCANISED INDIA-RUBBER HOSE AND TUBING is now manufactured especially for the above purpose; is of greater flexibility than any other description of Hose; is capable of resisting great pressure, and made suitable for attaching to the mains of water-works, or to tanks of high elevations.

WATERING HOSE fitted up with the necessary *brass joints, stop-cocks, branches,* and *spreaders complete.*

VULCANISED INDIA-RUBBER SUCTION PIPES, made any length or size for Pumps or Garden Engines.

VULCANISED RUBBER WASHERS, and also in Sheet, any thickness, for all kinds of steam and water joints, or made any size or figure to order.

All communications and orders punctually attended to, addressed to the Manufactory, Jas. Lyne Hancock, Goswell Road, London.

(Fig. 1.)

(Fig. 2.)

J. TYLOR AND SON'S BARROW GARDEN ENGINE (Fig. 1), in best well painted oak tub, fitted with improved Pump, universal joint, and registered Spreader, which answers the purpose of the separate rose fan and jet.

No. 1 holds 10 gallons, throws 30 feet high					...	£4 10
No. 2	„ 15	„	„ 45	„	...	5 10
No. 3	„ 28	„	„ 45	„	...	6 18

J. TYLOR & SON'S BARROW GARDEN ENGINE (Fig. 2), in strong tinned iron tub, well painted inside and outside, with improved Pump, universal joint, and registered Spreader, which answers the purpose of the separate rose fan and jet.

No. 10 holds 8 gallons, throws 25 feet high					...	£2 15
No. 13	„ 12	„	„ 30	„	...	3 5
No. 11	„ 16	„	„ 40	„	...	4 0
No. 12	„ 24	„	„ 45	„	...	5 0
No. 14	„ 30	„	„ 45	„	...	5 18

A large assortment of every description of Garden Syringes, Pail Engines, Conservatory Pumps, &c., kept in Stock.

No. 1, Plain Syringe, with rose and jet, diameter of barrel, 1½ inch, 14*s.* 3*d.*; No. 2, do., diameter of barrel, 1⅜ inch, 12*s.*; No. 3, do., diameter of barrel, 1⅛ inch, 10*s.* 6*d.*

Read's Syringe, with two roses and one jet, 19*s.*

J. Tylor & Son's Horticultural Apparatus may be obtained at these prices from any respectable Ironmonger or Seedsman in town or country, through whom alone they will be supplied, and of whom Drawings and Prices may be had.

N.B. Cost of carriage, &c., not included in these prices.

J. Tylor & Son's Manufactory, Warwick Lane, Newgate Street, London.

J. TYLOR AND SON'S REGISTERED GARDEN SYRINGE.—Small size, for Amateur use, **21s.** each. Large size, for Gardeners' use, **25s.** each.

Extra for Telescope Tube as shown in engraving for watering plants on stands at a height of 8 feet, so that any quantity of water can be deposited in the pot without wetting the leaves, 10*s.*

By a simple arrangement this Syringe is rendered more effective than any portable Conservatory or Garden Pump ever offered to the public. It is equally adapted for Garden or Conservatory use, and is capable of discharging twice as much water in a given time as any other Syringe now in use. The arrangement consists in attaching a small flexible suction tube to the barrel of the Syringe, through which it is filled with water at every discharge of the previous contents. By this means the Syringe is always charged, and the pull-up stroke of the piston rendered perfectly easy, it having, indeed, no work to do, the barrel being previously full of water. Being thus made self-supplying, a great saving of labour is effected; and the necessity of stooping to fill the syringe at every discharge being done away with, the direction of the water can be maintained for any length of time. It is perfectly cleanly in its action, as it is not possible for any water to get on the outside of the barrel, which is a well-known inconvenience attendant on the use of every other Syringe. Its construction is perfectly simple, and cannot get out of order; the ground in ball valves and fittings used for filling all other patent Syringes being entirely superseded. To be had of any respectable Ironmonger or Seedsman in town or country.

J. Tylor & Sons, Manufacturers of Horticultural Apparatus, Warwick Lane, Newgate Street, London.

N.B. These prices do not include carriage, package, or expenses of delivery in the country.

2, WINSLEY STREET, & 76, OXFORD STREET, LONDON.

CAUTION.

PARKES' STEEL DIGGING FORKS AND DRAINING TOOLS.

Whereas very inferior descriptions of Steel Digging Forks are now manufactured and sold, and I have been informed that purchasers of the same have believed them to be the same as those manufactured by me, and to which the Royal Agricultural Society and numerous Agricultural Societies' prizes have been awarded, I hereby respectfully inform the public that every Fork manufactured by me is stamped with my trade mark "J. P.," and that Messrs. BURGESS & KEY, of No. 103, Newgate Street, London, are my sole Wholesale Agents, and I have authorised them to replace to the purchaser every Fork of my manufacture found defective: they will also on application send Wholesale and Retail Price Lists, &c., post free. FRANCIS PARKES & Co.

SAMUELSON'S REGISTERED LAWN MOWING MACHINES. To cut 16, 19, 22, and 25 inches wide. The Registered Improvement renders unnecessary the great care requisite in the handling of these Machines on the old plan. All that is now required can be done *by any unskilled labourer*, who has only to push the Machine before him, the Registered Adjustment insuring a clean cut of uniform height, and preventing the knives from cutting into the soil, however uneven the ground may be. Illustrated Price Lists, with copies of Testimonials, and a Catalogue of his other Agricultural Implements, may be procured, post-paid, on application to the Manufacturer,

B. SAMUELSON, Britannia Works, Banbury, Oxon.

The above may also be procured at the principal Agricultural Implement Depôts in London, and of all respectable Ironmongers and Seedsmen in the country.

GLAZING WITH OR WITHOUT PUTTY.

E. DENCH, PATENT HOTHOUSE WORKS, King's Road Chelsea.—Printed Price Lists supplied on application.

Horticultural Glass Warehouse, 116, Bishopsgate Street Without, London.

IMPROVED MOWING AND ROLLING MACHINE.

ALEXANDER SHANKS AND SON, Arbroath, Forfarshire, Inventors and Sole Manufacturers, respectfully solicit the attention of the Nobility, Gentry, and Gardeners to this Improved Machine for Mowing and Rolling Lawns. The Machine is in operation in the Royal Gardens at Windsor Palace, Buckingham Palace, and at Osborne, in the Botanical Gardens at Kew, Regent's Park, Manchester, Sheffield, &c.; at Blenheim Palace, Trentham, Cleveden, Elvaston, Broadlands, Woburn Abbey, Clumber, Lilleshall, Castle Howard, Shrubland, Eridge Castle, Enville Hall, Tiptree Hall, Chatsworth, and in many other of the principal gardens in the kingdom as well as in the United States, British America, and on the Continent, where its merits have been fully proved, and its success established.

The machine is made to cut the breadth of 42, 30, 20, and 15 inches respectively, is exceedingly durable, easily managed, and adjusted to cut to the length required. The execution of the work is far superior to what may be attained by the most skilful mower, while at the same time a great saving of labour is effected, and the turf much improved. By the largest machine a Scotch acre may be mowed, rolled, and the Grass collected in one hour.

A. S. and SON have much pleasure in stating that they have made considerable improvements in their 15-inch or hand machine this year, by which the draught is considerably lessened. This machine combines all the merits and advantages of the larger machines with firm and secure construction, and is admirably adapted for borders and for lawns of no great extent.

ALEXANDER SHANKS and SON also respectfully solicit notice to "Fleming's Weeding or Salting Machine" for destroying weeds in gravel walks, court-yards, drives, &c. This machine is now in operation in many parts of England, where it has given ample satisfaction as the best and most economical means of thoroughly keeping down weeds or Moss

Further particulars with testimonials and prices, may be had on application.

LINCOLN CEMETERY.

To ARCHITECTS, SURVEYORS, LANDSCAPE GARDENERS, & OTHERS.

THE BURIAL BOARD offer the following PREMIUMS, namely:—For the best Set of Plans for an Episcopal Chapel and a Dissenters' Chapel, in separate and distinct buildings; a Lodge, with a waiting-room attached; a House for the Reception of the Dead; and Boundary Fences; accompanied by Estimates, 10*l.* For the Second best do., 5*l.*

For the best Plan and Estimate for Laying Out and Ornamenting the Ground, 10*l.* For the second best do., 5*l.*

At a Monthly Meeting of the Burial Board, held the 8th day of May, instant, it was ordered—That the Costs of the Chapels are not to exceed 500*l.* each; and that the Costs of the Lodge and other Buildings be left to the discretion of the Architects, having due regard to economy.

A Lithographed Plan of the Site may be had on application at our Office on and after the 14th inst.

For General Instructions and Conditions, see previous Advertisement in *The Builder* of the 5th of May inst.

WM. ANDREW, THURSTON G. DALE, } Clerks to the Burial Board.
Lincoln, May 12.

TULIPS.

TO BE SOLD, a well selected bed, of 60 rows, from the collections of Messrs. Goldham, Sanders, Delaforce, and most growers of celebrity, comprising many first class and new varieties; also the stage complete, cabinet for 168 rows, &c., the property of Mr. Clark, 1, Alpha Place, Coburg Road, Old Kent Road, who is giving up the cultivation on account of ill health.—May be viewed on the 23d, 24th, and 25th May. The stock being too limited to admit of sale by Auction, Mr. C. would treat with any purchaser for all or part.

TO FLORISTS AND GARDENERS.

TO BE SOLD, a great bargain, by valuation or private treaty, a first-class stock of Geraniums, Fuchsias, Roses, Verbenas, Dahlias, Calceolarias, Mimulas, Chrysanthemums, Hollyhocks, Carnations, Picotees, Pinks, Phloxes, and a general good assortment of Plants for any one in the trade; consisting of a very large Greenhouse 150 feet long, Forcing and Propagating Houses, Cold Pits, and Box Lights, with all sorts of Tools for use; likewise three large Water Tanks, and a good supply of Water; Ground well laid-out; and also a good lot of Fruit Trees in full bearing.

N.B. Situated in Surrey, about nine miles from London, adjoining a railway station, and within half a mile of a good market town; a good Dwelling House upon the premises, can be taken by year or lease.

Dahlias from 4*s.* to 9*s.* per doz; good sorts and strong plants.
Fuchsia " 6*s.* to 12*s.* " " "
Verbenas " 4*s.* to 6*s.* " all the best sorts.

Pinks, Picotees, and Carnations, all named, equally cheap. A good assortment of Bedding Plants cheap.—Apply to Mr. HOOK, 21, Brudinell Place, New North Road, Hoxton.

TO AGRICULTURISTS.

TO BE DISPOSED OF, with immediate possession, the interest in a very useful TURNIP and CORN LAND FARM, of about 330 Acres, well situated in the county of Essex, held on lease, 12 years unexpired. To an approved tenant, accommodation as to payment for valuation, stock, &c., would be given if required.—Apply to Mr. PARTRIDGE, Land Agent, Great Braxted Hall, Witham, Essex.

TO BE LET or SOLD, extensive and commodious Premises, exceedingly well situated at Kilburn Gate, London, surrounded by a fashionable and increasing neighbourhood. The premises, which were erected especially to suit the above trades, include a good DWELLING HOUSE, Greenhouses, Forcing-houses, Grounds, and every convenience for carrying on a large business.—For particulars apply to Messrs. FREND & HAMILL, 44, Bedford Row, London.

COUNTY OF KILDARE.—VALUABLE ESTATE.

TO BE SOLD, the HOUSE, DEMESNE, and LANDS of NEWBERRY, in the Parish of Carberry, and County of Kildare, consisting of 580 statute acres, held in fee farm. The House is large and commodious, with attached and detached Offices, Water laid all over the House, an excellent Walled Garden, and handsome Shrubberies and Plantations. The Lands have been thorough drained, are of prime quality, all under Grass, and in high condition, having been for the last 23 years, as they are at present, in the occupation of the proprietor. The fields are well watered, fenced, and sheltered with good hedges and valuable hedge-row Timber; also some fine old ornamental Timber, and a handsome piece of water in front of the house, with a Mill and Miller's House, and good water power, on the public road side. Upon these Lands there is an abundant supply of the best shell marl, limestone, sand, and gravel. Newberry Hall is 24 miles from Dublin, 3 miles from the large Market Town of Edenderry, 4 from the Enfield Station of the Great Midland Railway, 10 from the Curragh, and 2 from the Ticknevin Station on the Grand Canal. The Kildare Hounds hunt the county within 4 miles. The Church, Post Office, Dispensary, and Court House are in the Village of Carberry, immediately adjoining the Demesne, and the Roman Catholic Chapel about a statute mile distance. A purchaser can obtain immediate possession of the entire.—For further particulars, and order to view, apply to Messrs. H. WALLACE & Co., Solicitors, 30, North Great George's Street, Dublin; Victoria Street, Belfast; or Downpatrick.

FOWLS, PIGEONS, RABBITS, PARROTS, SINGING BIRDS, and FOREIGN SEED BIRDS of every description, sold or exchanged for any sort of live stock. Gold and silver-laced Bantams, White-faced Spanish, Brahmas, Black, White, and Buff Cochins, Polands, Dorking, Ptarmigan, Silk Fowl, &c. All sorts of Eggs, warranted to produce Chickens. The Spanish are white over the eye up to the comb, and the Dorkings have taken 12 first prizes last year. Almond Tumblers, Pouters, Carriers, Dragons, Antwerps, Owls, Nuns, Trumpeters, Balds, Beards, Tumblers, Fantails, and every other sort of Pigeon. Wanted, common Blue Pigeons, for shooting. Gold Spangled Hamburgs' Eggs, first prize at Birmingham.—Apply to W. WOODHOUSE, Poultry Salesman, 15, Mansfield Street, Kingsland Road, London.

EGGS FOR SETTING may be had from the Yard of Mr. H. D. DAVIES, whose stock has been carefully bred and selected from all the best strains, and has already taken upwards of 250 Prizes. Spanish, Dorking, Brahma, and Rangoon Eggs, 2*l.* 2*s.*, and White Cochin and Aylesbury Ducks, 1*l.* 11*s.* 6*d.* the dozen, to include basket, &c. Spanish and Dorking Fowls of all ages may be selected from that portion of the stock not required for breeding or exhibition this season. For Cock and 1 Pullet, 5*l.* 5*s.*; Cock and 2 Pullets, 7*l.* 7*s.*; Cock and 4 Pullets, 10*l.* 10*s.*—Remittances, by Post-office Order, payable to GEORGE KEEBLE, the Bailiff, Spring Grove House, Hounslow, to accompany all orders.—Mr. DAVIES will feel obliged if persons who wish to see the Poultry will make it convenient to do so between the hours of 10 and 4 on any Wednesday or Saturday.

Sales by Auction.

FANCY POULTRY.—PERIODICAL SALE.

The bed is 200 rows in length, and contains over 2000 full sized first class Blooming Bulbs, including most of the show flowers extant, all of the finest strain, and collected during the last 12 years at a cost exceeding 1000 guineas.

Catalogues may be had for two postage stamps of Mr. R. Parker, as above; of Mr. Turner, Royal Nursery, Slough; Mr. J. Keynes, Salisbury; Mr. Wood, the Coppice, Nottingham; Mr. E. S. Dodwell, Derby; Mr. Lightbody, Falkirk, N.B.; Mr. Slater, Cheetham Hill, Manchester; at the Office of this Paper; and of the Auctioneers, American Nursery, Leytonstone, Essex.

MITCHAM.—TO TULIP FANCIERS.

MESSRS. PROTHEROE AND MORRIS have received instructions from Mr. Goldham to submit to public competition by auction, without reserve, on the premises, Hynder Cottage, Merton Lane, Mitcham, Surrey, on SATURDAY, May 26, at 1 o'clock, a portion of his costly and unrivalled Collection of TULIPS. No comment on this magnificent stock will be equal to an inspection of its striking beauties, for which an opportunity is now offered to the amateur florist, &c. New Flowers and Seedlings of Mr. Goldham's raising—the result of more than 30 years' successful cultivation and competition; among these are—Fanny Kemble, John Kemble, Charles Kemble, Julius Cæsar, Napoleon, Fortunatus, Gem, Duchess of Sutherland, Standard, Lord Byron, Marshal Soult, Marshal Blucher, Emma, Calphurnia, Oliver Goldsmith, Othello, Comet, Biz. Mark Antony, Sir R. Peel, Helen, Lord Nelson, Picturata, Unique, Byb. Belvidera, Juliet, Marquis of Anglesea, Unique Rose, and Mount Hecla. Among Flowers raised by other growers are—Pandora, Thalia, Musidora, Matilda (new), Lord J. Russell, Apelles, Duke of Devonshire, Mrs. Siddons, Feu devorent, Stein's Victoria, Strong's Eliza, St. Neots, Fanny Ellsler, Parmeziano, General Bournonville, Louis XVI., Polydora, Wallace, Rutley's Queen, Duchess of Manchester, Commodora, Lord Collingwood, &c.—May be viewed two days prior to the Sale; Catalogues had on the premises; of the principal Seedsmen in London, and of the Auctioneers, American Nursery, Leytonstone, Essex.

THE FORWARDEST TURNIP KNOWN.

SUTTON'S EARLY SIX WEEKS' TURNIP should now be sown for feeding off early. Excellent new seed 1*s.* 2*d.* per lb., 6*s.* per gallon, or 42*s.* per bushel. Mr T. Hickman, of Brimpton House, near Newbury, in a letter dated February 1, says:—

"I must mention the Six Weeks' Turnip as the best sort I have ever seen for earliest and latest sowings. I have grown them several years, and have invariably found them to produce more seed in less time than any other Turnip. I have had them after Wheat of a good size, within six weeks from the time of sowing."

N.B. Carriage free, except parcels under 20*s.* value.

Address, J. SUTTON & SONS, Seed Growers, Reading, Berks.

SKIRVING'S IMPROVED TURNIP SEEDS.

W. SKIRVING, Queen Square, Liverpool, begs to acquaint his friends and the public that he has fixed the price of his TURNIP SEEDS for the season, as follows:—

SKIRVING'S IMPROVED SWEDE TURNIP, at 1*s.* 9*d.* per lb.

" IMPROVED PURPLE-TOP YELLOW BULLOCK TURNIP, at 1*s.* 8*d.* per lb.

All other kinds of Turnip and Agricultural seeds in general, of the most select description, at moderate prices. A remittance, or reference from unknown correspondents, is respectfully requested to accompany orders. W. S. has no agent in town or country.

Liverpool, May, 1855.

TURNIP SEED AND MANGOLD WURZEL.

MESSRS. J. AND G. SWAILES, NURSERYMEN, SEED GROWERS, &c., offer SWEDE and WHITE TURNIP MANGOLD WURZEL, &c., of the finest selected transplanted stocks grown last season by themselves. Priced Catalogue on application. We have a few sacks of Skirving's improved Purple-top Swede to offer to the trade, grown as above.

Beverley, Yorkshire, May 12.

OLD ESTABLISHED NURSERY AND SEED BUSINESS, SLEAFORD.

CHARLES SHARPE AND CO., NURSERYMEN and SEEDSMEN, Sleaford, beg leave to thank their friends and patrons for the support they still continue to receive in the above business, and to assure them that no effort shall be wanting on their part to merit a continuance of the favours which have been for many years past so liberally bestowed upon them.

C. S. & Co. are now supplying to the trade the following AGRICULTURAL SEEDS, of their own growth:—

MANGOLD WURZEL.—Yellow Globe. Long Red. Long Yellow.
CARROT.—Long Field Altringham. White Belgian.
TURNIP.—Skirving's Improved Swede. Improved Purple-topped.
TURNIP.—Globe, White. Globe, Red. Globe, Green. Tankard, Red. Tankard, White. Tankard, Yellow. Green-topped Yellow Aberdeen. Orange Jelly.
RAPE SEED.

Prices may be had on application.

C. S. & Co. take the present opportunity of informing their friends that they have no connection whatever with Mr. JOHN SHARPE, late of Sleaford, but now of Bardney, Seedgrower and Merchant.—Sleaford, May.

MEADOW AND PASTURE GRASS SEEDS.

GEORGE GIBBS AND Co., 26, Down Street, Piccadilly, beg to announce that their Mixtures of Grass Seeds are now ready for delivery at the following prices:—

Mixtures for laying Land down to permanent Grass, for light, heavy, and other soils (allowing 2 bushels and 12 lbs. to the acre) ... ... 30*s.* per acre.
Mixtures for Park or Field Lawns (allowing 2 bushels and 12 lbs. to the acre) ... ... 32*s.* per acre.
Mixtures for improving and renovating old Grass Land, 1*s.* per lb.
Mixtures (finest sorts) for forming Lawns... ... 1*s.* 3*d.* per lb.

These Seeds are all new, and have all been properly cleaned and their growing properties fully tested. Directions for sowing accompany the seed.

G. G. and Co.'s New Priced AGRICULTURAL CATALOGUE is now ready, and will be forwarded free on application.

GEORGE GIBBS & CO., SEEDSMEN,
26, Down Street, Piccadilly, London.

AGRICULTURAL SEEDS.

JOHN SHARPE (late of Sleaford), SEED GROWER and MERCHANT, Bardney, is now sending out, of the purest and best selected stocks, Permanent Grass Mixture, 20*s.* per acre; Upland Sheep Walk, 20*s.* per acre; Field or Lawn Mixtures, 9*d.* per lb., Improving Mixtures for old Swards.

CLOVERS. Red, English, Dutch, German, French, 6*s.* to 8*s.* per stone; White, 8*s.* to 10*s.* per stone; Italian Rye-grass, fine, imported, 6*s.* to 7*s.* per bushel; Perennial Rye-grass, 25*s.* to 35*s.* per quarter; Mangold Wurzel, 8*d.* per lb., or 7*s.* per stone.

TURNIPS.—Skirving's and Purple-top Swedes, transplanted, and of the purest characters, 1*s.* 3*d.* per lb., or 60*s.* per bushel of 50 lbs.; White Globe or Round, 8*d.* per lb., or 30*s.* per bushel of 50 lbs.; Green Globe or Barrel, 8*d.* per lb.; White and Red Tankards, Lincolnshire Red Globe or Round, Early Sixweeks, Yellow Aberdeen, Orange Jelly, and other yellow-fleshed kinds.

Rape Seed or Cabbage Cole, 3*s.* 6*d.* per peck, or 12*s.* per bushel.

White Mustard, Spring Tares, &c.

For quantities, Purchasers treated with liberally.

Attendance at Sleaford, Market Rasen, Boston, Louth, Lincoln, and Horncastle, on market days.

Bardney Hall, near Lincoln, May, 1855.

GEORGE ROGERS' NEW SEEDLING CINERARIAS.—Strong plants in bloom now ready to send out, Carriage Paid to London, Liverpool, Manchester, and various smaller stations, when the order contains a remittance.

ALMA.—Pure white, distinctly edged, dark crimson purple disc, dark purple petals, of great substance, very broad and round at the ends, gives the edging a perfect circle; form and size extra, habit and growth all to be desired, very dwarf, not more than 1 foot high, bearing a broad compact head of bloom. One of the finest ever offered. Price 10*s.* 6*d.* each.

EUPATORIA.—Bright Gentiana blue, black disc, around which is a light rosy shade, the petals broad and quite round at the ends, large size, and fine form; a dwarf grower, bearing a broad head of bloom. The blue, &c., of this is most unlike anything before offered. Price 7*s.* 6*d.*

INKERMANN.—Shaded rosy crimson, with a novel bright buff disc, dwarf grower, with compact head of bloom. This is not so good in form, but is offered for its novel and distinct colour, which is conspicuous in a collection. Price 5*s.*

The above have gained the favourable opinion of Mr. Glenny (the only party submitted to), more particularly Alma, which gained a high encomium. G. R. begs to say the cause of their not being offered before was to bloom them a second season, which they are now doing, superior to the first, from which he has the greatest confidence in their merits. The above with nine fine named varieties for 30*s.*

PHLOX ABDUL MEDSCHID KHAN.—Pure white, pink eye, quite hardy, one of the best plants for a white bed, blooming from July to November. Price 9*s.* per dozen.

Fine Collections of Dahlias, Verbenas, Fuchsias, Geraniums.

The above may be had by applying to Messrs. HURST & Co., Seedsmen, &c., 6, Leadenhall Street, London. Catalogues ready.

G. ROGERS, Seedsman & Florist, Uttoxeter.

DAHLIAS.

J. KEYNES is now sending out his New DAHLIAS for this season, and solicits the orders of his friends. Fine Plants may also be had of those splendid Dahlias sent out by him last season, at reasonable prices. Catalogues sent on application.—Castle Street Nursery, Salisbury.

SUPERB SHOW PANSIES.

JOHN HOLLAND, Bradshaw Gardens, Middleton, near Manchester, will supply the following set of 20 extra fine varieties, in strong, well rooted, autumn struck Plants, at 10*s.* the set, hamper, package, &c., included.

Argo (Paton & Small)	Lady Carrington (Hunt)
Adela (Turner)	Lord Jeffrey (Lightbody)
Alfred the Great (Turner)	Mesmerist (Veitch)
Boadicea (Fellowes) [ton)	Miss Talbot (Dickson & Co.)
Countess of Strathmore (Hamp-	Pandora (Hunt)
Commander-in-Chief (Hooper)	Rising Sun (Turner)
Father Gavazzi (Holland)	Sultan (Hooper)
Fearless (Schofield)	Sir J. Paxton (Betteredge)
Great Western (Hooper)	Thisbe (Hooper)
Lady Emily (Downie & Laird)	Victory (Schofield)

Older varieties, such as Fair Flora, France Cycole, Queen of England, Duke of Perth, Rubens, Caroline, Ophir, Blue Perfection, Euphemia, &c. &c., 4*s.* per dozen, strong plants.

A few packets of very select Pansy Seed at 1*s.* and 2*s.* per packet. Priced and descriptive Catalogues now ready, and will be forwarded on application. Post-office orders payable at Middleton, Lancashire.

TWO VERY USEFUL NEW DWARF NASTURTIUMS.

JOHN CATTELL has much pleasure in bringing into notice these two very showy hardy ANNUALS, viz.:—

NASTURTIUM DWARF CRIMSON.—The colour of the common dark crimson.

Ditto DWARF SCARLET.—The colour very rich orange scarlet, with a fiery shade on the upper part of the throat.

They are both of the dwarf compact habit of minimus, and admirably adapted for forming large buds, particularly in any poor soils; the flowers are the size of the common Nasturtium, and thrown well above the foliage, and are a mass of bloom throughout the summer and autumn. Packets, containing 12 seeds, 1*s.* each, post free.

J. C. has also the following choice Seeds for present sowing, at the prices annexed per packet, post free:—

	s. d.		s. d.
Alstræmeria acutifolia ...	1 0	Lychnis fulgens	0 6

N.B. The new Hybrid Perpetual Rose Emperor Napoleon will not be sent out before June; by that time I shall have proved it. If not more than semi-double, I much question if it is worth 7*s.* 6*d.* I, however, received a very high character of it, which induces me to offer it to the public, *but not to let it out before proving its worth.*

Carriage paid to any Station on the Eastern Counties Railway.
St. John's Street Nursery, Colchester.

MESSRS. J. AND H. BROWN offer the following CHOICE PLANTS, &c., which they will forward to any part:—

Conservatories, Greenhouses, and Gardens furnished on moderate terms.

Albion Nursery, Stoke Newington, London.—May 12.

WHEELER AND SON'S SHORT SELECT SEED LIST.—Our Priced List of Seeds for this season, containing Descriptions and Prices of the best GARDEN and FLOWER SEEDS, will be forwarded free by post. It is our earnest endeavour to send out all Seeds, whether for the Garden or Farm of the very best quality and true to name; and as many of the Seeds are our own growing, and are proved before sending out, we generally succeed in giving entire satisfaction to our customers.

We are in daily receipt of most gratifying letters and renewed orders from those we had the honour of serving last year; and as we deliver our Seeds CARRIAGE FREE, we very respectfully solicit the honour of an order from those who have not yet given us a trial.—J. C. WHEELER & SON, Gloucester, Seedsmen to the Gloucestershire Agricultural Society.

G. SMITH begs to state that a First Class Certificate was awarded April 26, 1855, by the National Floricultural Society, 21, Regent Street, London, to Verbena LORD RAGLAN. It has the following good properties, viz., Colour, bright scarlet crimson, with conspicuous light eye; Size of truss, large; Pip smooth, average size; habit good. The highest award is made by the Society for its general good qualities. G. S. begs to add that this is one of the finest Verbenas he ever offered to the floricultural world, either for bedding or showing purposes. Strong plants are now ready at 5*s.* each.

Also the following:—Boule de Feu, Empress, Mrs. M'Nab, Violacea, and Silistria, at 5*s.*, or the set of six for 24*s.* For descriptions see Catalogue, and Advertisement in the *Gardeners' Chronicle* of April 7, 14, 21, and 28, also Edwards' "Gardeners' Almanack" for 1855. G. S. has also a few extra strong plants of Petunia Singularity, very novel, at 5*s* each. Also new Fuchsias, and first class Geraniums, &c.

Tollington Nursery, Hornsey Road, Islington, London.

J. P. COGHLAN, late Gardener to Don Manuel Escandon, of the City of Mexico, has on hand in his garden in Orizaba a full Collection of the very interesting ORCHIDS of MEXICO, which he intends to keep in readiness to supply any orders he may receive from England. The plants are grown on the premises so as to enable him to judge of their merits previous to sending home any but those that are really worthy of cultivation. Any persons who may please to honour him with their commands will be certain to approve of the selection of plants and the manner in which their orders will be executed.

Reference can be made to Messrs. WM. WOOD & SON, Maresfield, near Uckfield, Sussex, and any orders intended for J. P. COGHLAN should be addressed to the care of Mr. THOMAS GRANDISON, Cocolappan, near Orizaba.

N.B. J. P. C. will be happy to furnish Collections of Dried Specimens for Herbariums, if required. References required from unknown correspondents.

NEW BEDDING PLANTS.

CHARLES TURNER has much pleasure in introducing the following New Plants:—

CALCEOLARIA "PURITY," a new and beautiful shrubby variety, pure paper white, dwarf free habit, and a most desirable bedding plant. Very highly recommended. 7*s.* 6*d.* each.

NEW VERBENAS.

*WONDERFUL (Edmonds), rich plum purple, with very large white centre. This is without exception the finest and most distinct variety yet introduced, and is especially recommended for bedding purposes, continuing fully in bloom until very late in the season. It obtained a Certificate of Merit at National Floricultural Society.

*BLUE BEARD (Edmonds), a decided blue, good shape, large truss, and an excellent bedding variety. Highly recommended.

*LADY LACON (Edmonds), bright rose, with large pale yellow centre, good shape and habit. This also is a first-rate bedding variety. Obtained a First-class Certificate at National Floricultural Society for form.

COMMANDER-IN-CHIEF (Edmonds), bright cerise, with yellow eye, free bloomer, and good habit. Very fine.

EMPRESS OF FRANCE (Edmonds), large pale rose, fine truss.

FLORENCE NIGHTINGALE (Edmonds), pink, yellow eye good shape.

ROSE OF ENGLAND (Edmonds), bright rosy pink, with yellow eye, good form, free and distinct, fine.

TYRIAN PRINCE (Edmonds), deep blue purple, fine and distinct. Received a Certificate at Norwich.

EVA (Turner), pure white, fine truss, and free bloomer.

The above 5*s.* each, or the Set for 2*l.* The three varieties marked thus * were figured in the "Florist" for April, 1855.

NEW DAHLIAS.

Pre-Eminent (Fellowes) 10*s.* 6*d.*		Glenlyon (Fellowes) ...	7*s.* 6*d.*
Lord Bath (Wheeler) ...	10 6	Diadem (Fellowes) ...	7 6
Espartero (Turner) ...	10 6	Constancy (Hopkins) ...	7 6
Beauty of Bath (Bush)	10 6	The Nigger (Fellowes)	10 6
Ringleader (G. Holmes)	10 6	Baron Alderson (Perry), a fancy variety ...	10 6
Cossack (Fellowes) ...	10 6		
Agincourt (Fellowes) ...	10 6		

For Descriptions of these varieties see Catalogue, which can be had on application.—Royal Nursery, Slough.

NEW STRAWBERRY—CAROLINA SUPERBA.

JAMES KITLEY begs to inform his friends and the public that he has succeeded in raising from Seed a New Strawberry, the qualities of which have long been a desideratum. It possesses the excellent flavour of the old Carolina, the fruit as large as the British Queen, with all the combined good qualities of productiveness, hardiness of plant, dwarf habit, &c., which tend to make it a general favourite. It was exhibited at the Chiswick Horticultural Exhibition, and obtained a First-class Certificate.—See *Gardeners' Chronicle*, July 15, 1854.

Dr. Lindley's Opinion.

"J. K., the Strawberry which you have named Carolina Superba partakes of the flavour of the old Carolina, but the fruit was bruised by carriage, so that the paper which accompanied the Strawberries was saturated with juice, and this juice dried on the paper like syrup—sweet, adhesive, glossy, and brownish coloured. Strawberry juice does not usually possess these properties."—See *Gardeners' Chronicle*, July 1, 1854.

The undermentioned gentlemen having had opportunities of seeing it growing, and also tasting the fruit, have kindly permitted their Testimonals to be placed before the public:—

"Your Carolina Superba Strawberry, which I saw last summer in bearing, appeared a very hardy and productive kind, with the flavour of the old Carolina, and will prove an acquisition to this class of fruit.

"JOHN SPENCER, Marquis of Lansdowne's, Bowood."

"I feel much pleasure in giving my opinion of your Seedling Strawberry, Carolina Superba. Having had frequent opportunities of seeing it growing and tasting the fruit, I consider it hardy, of good habit, short foliage and fruit-stem. In flavour and crop, I know none that will surpass it; and feel assured it will do you credit, and give satisfaction to all who may purchase it.

"JAMES POND, Devonshire Cottage, Bath."

"The Seedling Strawberry, named Carolina Superba, that I saw in fruit in your nursery last season, appeared to me to be a first-class variety of dwarf foliage, a profuse bearer, and flavour excellent. I have no doubt it will give the greatest satisfaction to all who may possess it.

"D. BUTLER, Widcombe Nursery, Bath."

Strong well-rooted PLANTS are now ready, at 3*l.* per 100, 10*s.* per dozen, or 12*s.* free by Post.—Lyncombe Vale Nursery, Bath.

Printed by WILLIAM BRADBURY, of No. 13, Upper Woburn Place, in the Parish of St. Pancras, and FREDERICK MOLLETT EVANS, of No. 22, Victoria Street, in the Parish of St. Margaret and St. John, Westminster, both in the County of Middlesex, Printers, at their Office in Lombard Street, in the Precinct of Whitefriars, in the City of London; and published by them at the Office, No. 5, Charles Street, in the Parish of St. Paul's, Covent Garden, in the said County, where all Advertisements and Communications are to be ADDRESSED TO THE EDITOR.—SATURDAY, May 12, 1855.

SMITH beg to offer FLOWERING PLANTS of the following (in quantities to the trade):—Geraniums, Fuchsias, Verbenas, Heliotropes, Calceolarias, Hydrangeas, Roses, Cactus, Ericas, Burchellia, Kalosanthes, Neriums, Scarlet Geraniums, &c. Prices on application. The Plants are stocky and in good condition: an inspection solicited.—Dulwich, Surrey.

FLOWER SEEDS.

PETER LAWSON AND SON, SEEDSMEN and NURSERYMEN to the QUEEN, Edinburgh, and at 27, St. George Street, Westminster, beg leave to invite attention to their very choice selection of Flower Seeds.

27, St. George Street, Westminster.

LUCOMBE, PINCE, AND CO. beg respectfully to announce that they are now sending out their superb new HYBRID HEATHS, for description of which see former Advertisements.

Exeter Nursery, Exeter.—Established 1720.

LUCOMBE, PINCE, AND CO. beg respectfully to announce that they are now sending out their new White Corolla'd FUCHSIAS; also their new double purple variety; for description of which see former Advertisements.

Exeter Nursery, Exeter.—Established 1720.

PELARGONIUMS, ETC.

HENRY GROOM, Clapham Rise, near London, by appointment FLORIST TO HER MAJESTY, begs to say that his Spring CATALOGUE OF PELARGONIUMS, &c., is ready, and will be forwarded on application.

OSAGE ORANGE (MACLURA AURANTIACA).

CHARLWOOD AND CUMMINS can supply SEED of the above-named Hedge Plant at 6*s*. per lb., with full directions for treatment. The month of May is the best time for sowing.—14, Tavistock Row, Covent Garden, London.

NEW PETUNIAS.

DANIEL MONEY having raised Three New PETUNIAS begs to offer them for sale. ROSEA ODORATA, deep rose colour, very sweet scented, and free bloomer. LILAC SUPERB, large flower. QUEEN, cream colour, with purple throat. D. M. has strong plants of the above sorts ready to send out. Rosea odorata, 5*s*. each, or the set 10*s*. 6*d*. Bedding Plants of sorts, 4*s*. per dozen. Post-office Orders to DANIEL MONEY, 4, St. George's Place, Water Lane, Brixton; or to Mr. JOHN KERNAN, 4, Great Russell Street, Covent Garden, London.

BEDDING AND OTHER PLANTS.

F. AND A. SMITH'S Descriptive LIST of the undermentioned is now ready, and may be had, post free, on application:—Antirrhinums, Verbenas, Fuchsias, Scarlet Geraniums, Calceolarias, Petunias, Heliotropes, Pentstemons, Chrysanthemums, Mimulus, Salvias, Lobelias, &c. Climbers in variety, also a miscellaneous Collection of Greenhouse Plants. They have now in bloom Cytisus racemosus, Roses, Verbenas, Fuchsias, spotted Calceolarias, Erica hybrida, Cactus, Geraniums, &c. The Trade supplied.—Dulwich, Surrey, May 19.

BEDDING PLANTS.

A. PAUL AND SON have a large stock of strong Bedding Plants, including VERBENAS, PETUNIAS, GERANIUMS, CALCEOLARIAS, &c., which they are now sending out. Price 4*s*. to 6*s*. per dozen. A Catalogue forwarded on application.—Nurseries, Cheshunt, Herts.

BEDDING PLANTS.

JOHN HAYES, FLORIST, Farnham, Surrey, begs to offer the above from 1*s*. to 4*s*. per dozen, the latter end of May, when the weather will permit. Catalogues sent on the receipt of one postage stamp.

MESSRS. JOHN WEEKS AND CO. have now ready a well grown stock of BEDDING PLANTS, selected from the best existing varieties, and at most reasonable prices.

Horticultural Establishment, King's Road, Chelsea; and at Frankfort-on-the-Maine.

EDWARD PARKE FRANCIS offers the following Bedding-out Plants, strong and vigorous, from 3*s*. to 4*s*. and 6*s*. per dozen:—Scarlet Geraniums, Flower of the Day ditto, Verbenas, Calceolarias, Salvias, Heliotropes, Fuchsias, Petunias, Lobelias, Anagallis, Ageratum, Cupheas, &c. Carriage paid to London.—Rose Nurseries, Hertford.

BEDDING PLANTS.—AT 2*s*. 6*d*. PER DOZ.

JOHN SCOTT, Merriott Nurseries, Crewkerne, Somerset (established 1728), has nearly 20,000, in 3-inch pots, ready to be sent out. Post-office Orders payable at Crewkerne.

(Baskets and Package at the Expense of Purchaser, and not returnable.)

200 Sorts of the best and newest Verbenas.
120 do. Scarlet and other Bedding Geraniums.
20 do. Variegated leaved ditto.
100 do. Fuchsia, all the best; 24 do. Shrubby Calceolarias; 24 do. Petunias; with Anagallis, Ageratums, Cupheas, Heliotropes, Lobelias, Salvias, Senecios, &c. Also the beautiful white Double Pyrethrum.

When a fair proportion of each is taken the price will be 2*s*. 6*d*. per dozen; but if only Calceolarias and Geraniums are ordered they will be 4*s*. per dozen. Catalogues, in which the above are arranged in sections of colour, &c., sent on receipt of a postage stamp. Parties requiring large quantities can have them in store pots by agreement.

GOOD SWEDE SEED.

SUTTON AND SONS *have good new Ashcroft, Skirving's, and other Swede Seeds, true to their kinds, warranted all of last year's growth.* Price, in large or small quantities, 2*s*. per lb. Large quantities CARRIAGE FREE. Remittances or references required from unknown correspondents.

Address, SUTTON & SONS, Seed Growers, Reading.

HARDY GREEN-TOP YELLOW SWEDE.—This Swede has stood the late severe winter remarkably well, and can be strongly recommended for weight of crop and highly nutritive properties.

SUTTON & SONS, Seed Growers, Reading, have some excellent Seed which they can warrant of last year's growth, price 1*s*. 9*d*. per pound, 10*s*. 6*d*. per gallon, or 70*s*. per bushel. As every Seed grows well, 2 lbs. per acre will produce a full crop.

SUTTON'S LARGE YELLOW GLOBE MANGOLD WURZEL, FROM SELECTED ROOTS, QUITE HARDY.—Seed of this fine large Mangold Wurzel may be obtained genuine of Messrs. SUTTON, price 1*s*. per lb., or 5*l*. per cwt.; other sorts cheaper. Early orders are requested and recommended, as the stock is limited.—Address,

JOHN SUTTON & SONS, Seed Growers, Reading, Berks.

FINE MANGOLD WURZEL AND BELGIUM CARROT SEED.

JAS. FAIRHEAD, SEED GROWER, Braintree, Essex, begs to offer, at moderate prices, ORANGE GLOBE, RED GLOBE, LONG RED, and LONG YELLOW MANGOLD WURZEL; WHITE and ORANGE GREEN-TOPPED BELGIAN CARROT, of selected Stocks, the growth of 1854.

Carriage paid to any Station on the Eastern Counties Railway.

TURNIP SEED AND MANGOLD WURZEL.

MESSRS. J. AND G. SWAILES, NURSERYMEN, SEED GROWERS, &c., offer SWEDE and WHITE TURNIP MANGOLD WURZEL, &c., of the finest selected transplanted stocks grown last season by themselves. Priced Catalogue on application. We have a few sacks of Skirving's improved Purple-top Swede to offer to the trade, grown as above.

Beverley, Yorkshire, May 19.

SKIRVING'S IMPROVED TURNIP SEEDS.

W. SKIRVING, Queen Square, Liverpool, begs to acquaint his friends and the public that he has fixed the price of his TURNIP SEEDS for the season, as follows:—

SKIRVING'S IMPROVED SWEDE TURNIP, at 1*s*. 9*d*. per lb.
" IMPROVED PURPLE-TOP YELLOW BULLOCK TURNIP, at 1*s*. 3*d*. per lb.

All other kinds of Turnip and Agricultural seeds in general, of the most select description, at moderate prices. A remittance, or reference from unknown correspondents, is respectfully requested to accompany orders. W. S. has no agent in town or country.

Liverpool, May, 1855.

T. F. WINSTANLEY'S BEDDING PLANT LIST is now ready, and can be had on application, or free by post.—28, Market Place, Manchester.

MAY'S MAGNUM BONUM LETTUCE is by far the largest, sweetest, and crispest Lettuce known, in proof of which we possess numerous letters received from parties who had it last season. The addresses of the writers can be had on application. It may be sown all the summer, and will stand the winter. Packets 1*s*. each.

HENRY MAY, the Hope Nurseries, near Bedale, Yorkshire.

NEW AZALEA—"ALBA MELIOR."

THIS is the one exhibited by us under the name of "ALBA MAGNA" among our collection to which the First Prize was awarded at the Regent's Park Show; very large pure white, and quite first-rate. Price 7*s*. 6*d*., 10*s*. 6*d*. to 21*s*. each. Also a superior stock of Azaleas, for which see Catalogue.

The Spring Catalogue, consisting of Greenhouse and Stove Plants, and the Herbaceous one can be had by enclosing one postage stamp.

H. LANE & SON, The Nurseries, Great Berkhamstead.

NEW PLANTS.

A. VERSCHAFFELT, NURSERYMAN, Ghent (Belgium), is now sending out his following New Plants:

Achimenes Ambroise Verschaffelt	8*s*.	0*d*.
" Docteur Hopf	8	0
" Edouard Otto	4	0
" Edmond Boissier	8	0
Tydæa Warscewiczi	15	0
Rhododendron Prince Camille de Rohan (quite hardy)	16	0

All the above Plants are figured in VERSCHAFFELT'S "Illustration Horticole," which can be seen at Mr. R. SILBERRAD'S, 5, Harp Lane, Great Tower Street, London.

WILLIAM KNIGHT, FLORIST, &c., begs to offer the following Select Bedding Plants, post free:—

	s.	*d*.
12 fine varieties Antirrhinums, 3*s*.; 12 extra ditto	6	0
12 " Verbenas, 2*s*. 6*d*.; 12 extra ditto	6	0
12 " Phloxs, 4*s*.; 12 extra ditto	6	0
12 " Pansies, 4*s*.; 12 extra ditto	9	0
12 fine Chrysanthemums, Pompones, or large flowered	3	6
12 fine varieties Mimulus, 4*s*.: 12 Belgian Daisies	3	0

67, High Street, Battle, Sussex.

DAHLIAS.

J. KEYNES is now sending out his New DAHLIAS for this season, and solicits the orders of his friends. Fine Plants may also be had of those splendid Dahlias sent out by him last season, at reasonable prices. Catalogues sent on application.—Castle Street Nursery, Salisbury.

NEW SCARLET VERBENA.—MRS. WOODROFFE.

ARTHUR HENDERSON AND CO. are now sending out this fine new VERBENA; particulars of which may be seen in their advertisement in the *Gardeners' Chronicle* of March 31. The usual discount to the Trade.

☞ This Verbena is the same as "Conqueror," one offered by another firm.—Pine-apple Place, Edgware Road, London.

SUPERB HOLLYHOCKS, SEEDS, ETC.

WILLIAM CHATER begs to offer packets of seed, consisting of 20 varieties, from his best Show Hollyhocks, at 5*s*.; 12 varieties, 2*s*. 6*d*.; and from good double sorts, 1*s*.

Superior Quilled German and French Asters, in 12 varieties, mixed, 1*s*. per packet; separate, 2*s*. Fine Quilled African Marigolds, 6*d*. per packet.—Saffron Walden Nurseries.

CHOICE CINERARIA SEED.

LUCOMBE, PINCE, AND CO. have now ready for sending out Seeds of their very superior CINERARIAS, which have been saved with great care from the finest varieties. The great satisfaction which their Cinerarias have given for several successive years, enables them to recommend their Seed of the present season with much confidence. Packets sealed and warranted by them at 2*s.* 6*d.*, free by post.

Exeter Nursery, Exeter.—Established 1720.

BOSSOM'S CHAMPION OF ENGLAND CELERY.

THE finest Celery yet introduced, beautifully white, very crisp and solid, and withstands a greater amount of frost than any other known variety; it has been blanched in the ground 3 feet.—To be obtained of T. F. WINSTANLEY, Seedsman, 28, Market Place, Manchester, price 2*s.* 6*d.* per packet; prices to the trade on application.

G. SMITH begs to state that a First Class Certificate was awarded April 26, 1855, by the National Floricultural Society, 21, Regent Street, London, to Verbena LORD RAGLAN. It has the following good properties, viz., Colour, bright scarlet crimson, with conspicuous light eye; Size of truss, large; Pip smooth, average size; habit good. The highest award is made by the Society for its general good qualities. G. S. begs to add that this is one of the finest Verbenas he ever offered to the floricultural world, either for bedding or showing purposes. Strong plants are now ready at 5*s.* each.

Also the following:—Boule de Feu, Empress, Mrs. M'Niel, Violacea, and Silistria, at 5*s.*, or the set of six for 24*s.* For descriptions see Catalogue, and Advertisement in the *Gardeners' Chronicle* of April 7, 14, 21, and 28, also Edwards' "Garden Almanack" for 1855. G. S. has also a few extra strong plants of Petunia Singularity, very novel, at 5*s.* each. Also new Fuchsias, and first class Geraniums, &c.

Tollington Nursery, Hornsey Road, Islington, London.

TWO VERY USEFUL NEW DWARF NASTURTIUMS.

JOHN CATTELL has much pleasure in bringing into notice these two very showy hardy ANNUALS, viz.:—

NASTURTIUM DWARF CRIMSON.—The colour of the common dark crimson.

Ditto DWARF SCARLET.—The colour very rich orange scarlet, with a fiery shade on the upper part of the throat.

They are both of the dwarf compact habit of minimus, and admirably adapted for forming large buds, particularly in any poor soils; the flowers are the size of the common Nasturtium, and thrown well above the foliage, and are a mass of bloom throughout the summer and autumn. Packets, containing 12 seeds, 1*s.* each, post free.

J. C. has also the following choice Seeds for present sowing, at the prices annexed per packet, post free:—

N.B. The new Hybrid Perpetual Rose Emperor Napoleon will not be sent out before June; by that time I shall have proved it. If not more than semi-double, I much question if it is worth 7*s.* 6*d.* I, however, received a very high character of it, which induces me to offer it to the public, *but not to let it out before proving its worth.*

Carriage paid to any Station on the Eastern Counties Railway.

St. John's Street Nursery, Colchester.

EVERGREEN GRASSES FOR CHURCHYARDS, ETC.

SUTTON AND SONS have had the honour of supplying many clergymen and others with Grass Seeds for Churchyards and Cemeteries, which have given great satisfaction. Price of Seed, 1*s.* per lb., or 18*s.* per bushel.

From many similar letters we present the following:—

From Mr. C. Judd, Gardener to his Grace the Archbishop of Canterbury.

"The Grass Seeds received from you succeeded admirably, although sown late, the growth was such that we were enabled to mow the churchyard in the autumn, and it has now the appearance of an established lawn of some years standing; my employer the Archbishop of Canterbury, is quite satisfied with its appearance.—Addington Park, Jan. 7."

Address, JOHN SUTTON & SONS, Seed Growers, Reading, Berks.

THE PAMPAS GRASS "GYNERIUM ARGENTEUM."

LUCOMBE, PINCE, AND CO. have a fine healthy stock of this highly Ornamental Plant, well established in pots, and fit to send out immediately. It is universally admitted that few plants produce a more beautiful effect than this gigantic Grass. See Woodcut and description of it in the *Gardeners' Chronicle* of November 4th, 1854. Sizes, prices, and all particulars may be had on application to LUCOMBE, PINCE, & CO.

Exeter Nursery, Exeter.—Established 1720.

MESSRS. E. G. HENDERSON AND SON beg to announce that their new Spring CATALOGUE for 1855, will be sent post free on application, and for 12 postage stamps a beautiful coloured plate representing the following choice plants:—

Achimenes Ambroise Verschaffelt.	Delphinium Hendersoni.
Acacia Drummondi microphylla.	Genetyllis macrostegia (tricoloides).
Boronia Drummondi.	Fuchsia Queen Victoria.
Bouvardia longiflora.	—— Mrs. Story.
	—— Prince Albert.

Mr. Andrews, the first floricultural artist of the day, has had the getting up of this plate, so that full reliance may be placed on the correctness of the flowers represented and the superior style of the colouring.

GERANIUM SILVER QUEEN.—A valuable plant for bedding, which by accident was brought under our notice last season. Several plants were planted out for trial, and beside them a few of every other variegated foliage Geranium in cultivation: these were Flower of the Day, Mountain of Light, Attraction, Brilliant, Silver King, Mangles' Silver, and others, but the foliage and growth of all proved inferior to this one, and viewing the lot from afar or near, this variety stood out in bold relief from all others of a like character. The foliage is large, round and smooth; habit dwarf and spreading with a free growth, and flowers of a rosy pink, similar in colour to the Geranium Lucia rosea. 7*s.* 6*d.*

TURNIP SEEDS, ETC.

PETER LAWSON AND SON SEEDSMEN to the QUEEN and to the HIGHLAND AGRICULTURAL SOCIETY, beg leave to intimate that they are sending out the following TURNIP SEEDS, for which they respectfully solicit orders. They are all of the most approved kinds of last year's growth.—

Double Daisy, from 60 newest varieties	0 6
Sweet William, from 50 fine varieties	0 6

67, High Street, Battle, Sussex.

WHEELER AND SON'S SHORT SELECT SEED LIST.—Our Priced List of Seeds for this season, containing Descriptions and Prices of the best GARDEN and FLOWER SEEDS, will be forwarded free by post. It is our earnest endeavour to send out all Seeds, whether for the Garden or Farm, of the very best quality and true to name; and as many of the Seeds are our own growing, and are proved before sending out, we generally succeed in giving entire satisfaction to our customers.

We are in daily receipt of most gratifying letters and repeated orders from those we had the honour of serving last year, and as we deliver our Seeds CARRIAGE FREE, we very respectfully solicit the honour of an order from those who have not yet given us a trial.—J. C. WHEELER & SON, Gloucester, Seedsmen to the Gloucestershire Agricultural Society.

GERMAN ASTER SEED, all saved from the finest Globe varieties ever yet exhibited, and which have far passed all others in cultivation for their immense size and distinct colours, 1*s.* per packet.

SWEET WILLIAM SEED saved from 50 of the choicest and most superb varieties, 1*s.* per packet.

ANTIRRHINUM SEED saved from all the finest shaped and best varieties, 1*s.* per packet.

SUPERB HOLLYHOCK SEED saved from all the best named flowers, 1*s.* per packet.

SCARLET GIANT BROMPTON STOCK, extra fine, 1*s.* per packet.

VERY SUPERIOR FIMBRIATA PRIMULA SINENSIS SEED, saved from six distinct varieties of the largest and finest superb plants ever grown, 2*s.* 6*d.* per packet.

PANSY SEED, a few packets from selected varieties, 1*s.* per packet.

POLYANTHUS SEED, fine mixed, 1*s.* per packet.

CROWN GOURD, or CUSTARD MARROW; this variety is the most delicious of all the Marrows grown, 1*s.* per packet.

AQUILEGIA, or COLUMBINE, of 12 distinct varieties, 1*s.* per packet.

Any three packets of the above (except the Primula) sent free on receipt of 2*s.* 6*d.*, or the Primula included with two other packets, for 3*s.* 6*d.*, in cash or penny postage stamps by

EDWARD TILEY, NURSERYMAN, SEEDSMAN, AND FLORIST, 14, Abbey Church Yard, Bath, Somerset.

SUPERIOR EARLY BROCCOLI.

MITCHINSON'S PENZANCE OR EARLY WHITE CORNISH BROCCOLI.—*Celebrated and invaluable for its earliness, coming into use early in February, a full-sized handsome head of excellent quality, but a shy seeder.*

Parties who were too late to procure seeds of this valuable Early Broccoli can now be supplied with good healthy PLANTS at 2s. 6d. per 100, carriage free, by sending immediate orders to the undersigned, or their Agents in London. For testimonials and names of Agents see former advertisements.

JOHN MITCHINSON & Co., Seed Merchants, Truro, Cornwall.

May 19, 1855.

SEEDS OF SELECT HARDY PLANTS.

WILLIAM MOORE begs to offer the following SEEDS, all saved at the establishment, and warranted good, at 6d. per packet, or the collection for 5s. Payment to be made in postage stamps.

Scarlet Poppy Anemone.	Geum splendens.
Alstrœmeria aurea.	Helianthemum, 10 sorts mixed.
Anchusa italica.	Lupinus magnificus.
Antirrhinum, fine striped.	Myosotis sylvaticum, fine sp.
Dianthus montana, rubra & alba.	Potentilla bicolor grandiflora.
German Wall-flower, fine mixed.	Polyanthus from the best sorts.

Norfolk Nursery, East Dereham.

NEW PLANTS.

MESSRS. YOUELL AND CO. beg to offer the following:—

Calceolaria EMPEROR NAPOLEON: a Seedling of our own, resembling "Henderson's Model," but larger, brighter coloured, and finer in every respect: of good habit, and one of the very best bedding varieties in cultivation. 7s. 6d. each.

Calceolaria EMPRESS EUGENIE: another of our Seedlings, of a fine golden yellow, the flower stems stout, as they need be, to support the very large trusses of flowers produced by this variety; the habit is robust, flowers large, and well formed. 7s. 6d. each.—The usual discount to the trade.

VERBENA "MRS. FOSTER."

This fine white variety, raised by Mr. EDMONDS, gardener at Scrathy Hall, is, we confidently assert, the finest ever offered, and will prove to "White Verbenas" what "Robinson's Defiance" was to the scarlet varieties which preceded it. It was forwarded to the National Floricultural Society, and favourably noticed; but unfortunately the blooms were so much damaged in the transit as to preclude the possibility of its being fully estimated. The habit of the plant is all that can be desired, the heads of flowers (which are produced in profusion, large and flat, the individual flowers round and of good substance, resembling some of those fine Phloxes lately introduced, and of the purest white. Strong plants 5s. each, and one over to the trade when three are taken.

YOUELL & Co., Royal Nursery, Great Yarmouth.

JOHN CATTELL has a plentiful supply of PLANTS of the following, autumn-sown and bedded, superior true sorts:

Cauliflower, early and late	4s. per 100
Broccoli, Cape (Grange's and Hammond's) ...	3s. "
Cabbage, Red	1s. 6d. "
" Early, of sorts...	7s. per 1000
" Drumhead or Cattle	5s. "
Savoy, of sorts	5s. "

Packages containing Plants to the value of 1l. and upwards will be delivered carriage free to London, and to the Edenbridge Station of the South-Eastern Railway, package included. A remittance must accompany orders from unknown correspondents.

Nurseries, Westerham, Kent.

JOHN CATTELL begs to announce that his CATALOGUE No. 4 for the Spring of 1855, containing choice selections of GERANIUMS, VERBENAS, MISCELLANEOUS BEDDING PLANTS, &c., is now ready and may be had on application, inclosing a penny stamp. J. C. particularly directs attention to the following selection of very desirable plants:—

VARIEGATED GERANIUMS.	Each—s.	d.
Attraction (Gaines)	1	6
" (Kinghorn) habit and colour of Flower of the Day, with a beautiful deep pink horse-shoe mark 3s. 6d. to	21	0
Brilliant, leaves edged with silvery white, flowers deep brilliant scarlet ... ... 1s. 6d. to	2	6
Favourite ... ... 7s. 6d. to	15	0
Flower of the Day, fine stout plants for bedding ... 6d. to	1	6
Golden Chain, extra strong ... ... 1s. 6d. to	2	6
" " good plants for bedding ... per doz.	12	0
" Admiration	2	6

NOTICE.

"TO THOSE THIS ADVERTISEMENT MAY CONCERN."—The undersigned having a very extensive connection amongst Noblemen, Gentlemen, their Gardeners, Market Gardeners, and Amateur Growers throughout the country (Lancashire and Cheshire especially), also a shipping connection on an extensive scale amongst the principal leading shipping firms in Liverpool to all Parts of the Globe, will in conjunction with his other business undertake an Agency on Commission or otherwise for the sale of such goods of the very First Class only, as his position and connections would be most likely to effect readily the sale of. His having an establishment of many years' standing in the midst of the daily resort of Gentlemen, Gardeners, and Agriculturists, and also Shipstores situated immediately opposite the principal Docks in Liverpool, where vessels of the largest tonnage sail almost daily to America, Australia, the Crimea, and other parts of the world, offers facilities for the Sale of Genuine Goods rarely to be met with.—Apply, stating terms and description of goods, &c., to GEORGE TAYLOR, jun., Fruit Salesman, St. John's Market, Liverpool. References of the highest class furnished.

CARRIAGE FREE, EXCEPT SMALL PARCELS.

ADDRESS: SUTTON & SONS, SEED-GROWERS, READING.

NEW AND BEAUTIFUL PLANTS.

MESSRS. VEITCH & SON,

OF EXETER, AND THE EXOTIC NURSERY, CHELSEA,

HAVE much pleasure and confidence in offering the following novelties. In making the present selection, Messrs. VEITCH & SON have been guided solely by the determination of submitting only such plants as are of general usefulness and sterling merit.

DESFONTANIA SPINOSA.—A fine hardy evergreen shrub with glossy Holly-like foliage, introduced from the Andes of Patagonia, by Mr. William Lobb, who discovered it in the region of snow. It produces beautiful tubular-shaped blossoms, often 2 inches in length, and of a rich scarlet colour, tipped with yellow. (See figure in Curtis's "Botanical Magazine," for May, 1854.) This plant, having been fully exposed in the open ground during the last severe winter, may now be considered perfectly hardy, and is certainly a great acquisition. Fine established plants, of two sizes, 21s. and 42s. each. One over on three to the trade.

DIPLADENIA ACUMINATA of HOOKER; *synonyme* DIPLADENIA MAGNIFICA of the "Florist."—This really beautiful Dipladenia was exhibited at Chiswick, at the July Meeting last year, and was awarded the large Silver Medal. Both as an exhibition plant, as well as one for general ornament to the stove, it is scarcely rivalled. (It is figured in Curtis's "Botanical Magazine," for January of the present year, and in the "Florist" for November, 1854.) Strong plants, 15s. each, with one over to the trade where three are taken.

ESCALLONIA PTEROCLADON.—This pretty hardy shrub, is figured in the "Botanical Magazine" for January last. It was exhibited at Chiswick, at the July Meeting of last year, and received a Silver Medal. It is a dwarf compact habit, with dense dark green foliage, and abundance of pure white Epacris-like flowers, and is altogether a neat and desirable plant. Well established plants, 10s. 6d. each. One over on three to the trade.

EPACRIS ECLIPSE (STORY'S).—This is a striking flower, of fine habit, and great freeness of bloom; it was raised from Miniata grandiflora, crossed with a fine seedling. Strong plants, 10s. 6d. each. One over on three to the trade.

EURYBIA ALPINA.—This is a perfectly hardy evergreen shrub (from a high elevation in New Zealand), having stood without any protection the late severe winter. Strong plants, 10s. 6d. each. One over on three to the trade.

GRIELINIA LITTORALIS.—This is a perfectly hardy evergreen shrub, with bright glossy green foliage, and fine habit. It has stood perfectly unharmed during the last severe winter, in situations where the ordinary evergreen shrubs were much injured. Strong plants, 15s.; second size, 10s. 6d. each. One over to the trade on three.

IXORA FLORIBUNDA.—A very neat plant, of dwarf compact habit, and a most abundant bloomer. It was sent from Java by Mr. Thomas Lobb, and is a very pretty plant. Strong bushy plants, 21s.; smaller, 10s. 6d. each. One over to the trade on three.

LAURUS AROMATICA.—A greenhouse plant, with deliciously fragrant foliage. Good plants, 10s. 6d. each. One over to the trade on three.

LOMATIA FERRUGINEA.—This fine evergreen shrub was found in Chiloe and Patagonia by Mr. W. Lobb. It attains a height of from 6 to 8 feet, and is remarkable for its beautiful Fern-like foliage. As a fine leaved conservatory plant, it is perhaps without a rival, and no collection of fine foliaged plants should be without it. It has but to be seen to be admired. Fine established plants, of two sizes, 15s. to 21s. each. One over to the trade on three.

MYRTUS APICULATA.—A very pretty Myrtaceous plant, of the same degree of hardiness as the ordinary Myrtles; fine dark green foliage, and an abundant bloomer. Strong plants, 21s. 6d. each. One over to the trade on three.

PINUS PENTHAMIANA.—Having raised Seedlings of this beautiful Pine (which is doubtless the finest of the long leaved Californian kinds, and which has proved to be perfectly hardy), we are now enabled to offer established plants in pots as follows: for a single plant, 10s. 6d.; for six, 50s.; for 12, 84s. Prices to the trade in proportion to the quantity taken.

PODOCARPUS NUBIGENA.—This is another perfectly hardy and fine Taxaceous plant, sent from Patagonia by Mr. W. Lobb. Established plants, 21s. each. One over to the trade on three.

RHODODENDRON CALIFORNICUM.—This is a distinct species, sent from California by Mr. W. Lobb, and described as having fine trusses of rose coloured flowers. It is perfectly hardy, having survived the past winter in the open border, without any protection whatever. The foliage is good, and it is evidently an abundant bloomer, small seedling plants being now covered with flower buds. It is a late bloomer, and will doubtless be a great acquisition to hybridisers. It will be exhibited when in bloom. Strong well established plants, 10s. 6d. each. One over to the trade on three.

SONERILA MARGARITACEA.—This lovely plant was exhibited at the Horticultural Society's Rooms, 21, Regent Street, on the 7th of November last, and was the gem of the exhibition. (See report in *Gardeners' Chronicle*). It is perhaps the most chaste of all variegated plants, producing with dark glossy green leaves, dotted all over with silvery white spots, a profusion of beautiful crimson flowers, with yellow stamens. It is a dwarf compact plant, of particularly neat habit, and requires the temperature of a cool stove or warm greenhouse. (It is figured in the "Florist" for March last). Plants, 21s. each. One over on three to the trade.

SWAINSONIA LESSERTIFOLIA.—A very pretty shrubby Australian Papilionaceous plant, with spikes of flower resembling in colour Kennedya bimaculata. It is a free growing plant, and profuse bloomer. Strong plants, 7s. 6d. each. One over on three to the trade.

TORREYA MYRISTICA.—This is a splendid hardy Taxaceous plant, sent from California by Mr. W. Lobb. It is from the Sierra Nevada, at a high elevation, and attains the height of from 100 to 150 feet. The stock of this Plant is very limited. Strong Seedling Plants, 63s. each.

WELLINGTONIA GIGANTEA.—Ample description of this noble tree having appeared in former advertisements or circulars, it is only necessary now to say, that it is a Coniferous tree, of immense dimensions and great beauty. Having withstood the severity of the past winter, without injury, both at Chelsea and Exeter, there can be no doubt of its being a perfectly hardy tree. This is doubtless the most remarkable and interesting of recent introductions. A few of the first raised, extra sized plants, 42s.; second size, 31s. 6d.; third size, 21s. each. A deduction will be made on the above prices in proportion to the quantity taken.

Prices given to the trade on application.

Messrs. VEITCH & SON can also supply the following good and popular Plants:—

	Each.—s.	d.
Abies bracteata (seedlings)	63	0
Aphelandra Leopoldi ...	7	6

For quantities, Purchasers treated with liberally.

Attendance at Sleaford, Market Rasen, Boston, Louth, Lincoln, and Horncastle, on market days.

Bardney Hall, near Lincoln, May, 1855.

HORTICULTURAL WORKS AND HOT-WATER APPARATUS MANUFACTORY.

KENSAL GREEN, HARROW ROAD, LONDON.

JOHN TAYLOR AND SON beg to call the attention of the nobility and gentry to the very superior manner in which they Erect all kinds of Conservatories, Vineries, Greenhouses, &c., combining every improvement with elegance of design, and durability of materials and workmanship.

Their VENTILATING APPARATUS for the Fronts and Roofs of Houses has given the highest satisfaction. Churches, Chapels, Schools, Entrance Halls, Public Buildings, &c., heated with Hot-Water Apparatus in a most economical and efficient manner. J. T. & SON have great pleasure in referring to numbers of the nobility and gentry by whom they are extensively engaged.

HORTICULTURE IN ALL ITS BRANCHES.

JOHN WEEKS & Co., King's Road, Chelsea,

HOTHOUSE BUILDERS.

THE NOBILITY AND GENTRY about to erect Horticultural Buildings, or fix Hot-water Apparatus, will find at our Horticultural Establishment and Hothouse Works, King's Road, Chelsea, an extensive variety of Hothouses, Greenhouses, Conservatories, Pits, &c., erected, and in full operation, combining all modern improvements, so that a lady or gentleman can select the description of House best adapted for every required purpose.

The HOT-WATER APPARATUS, which passes through all the Houses and Pits, affording both top and bottom heat, is in constant operation and particularly worthy of attention.

Many of the Houses and Pits are of wide and lofty dimensions, and together equal in length 1000 feet. They are all effectually heated by *one boiler*, which, during the severe winter months does not cost in labour and fuel more than 3*s*. 8*d*. per day, and the apparatus is so arranged that each House or Pit may be heated separately and to the required temperature. The splendid collections of Stove and Greenhouse Plants are also in the highest state of cultivation, and for sale at very low prices. Also a fine collection of strong Grape Vines in pots, from eyes, all the best sorts.

Plans, Models, and Estimates of Horticultural Buildings; also Catalogues of Plants, Vines, Seeds, &c., forwarded on application to JOHN WEEKS & Co., King's Road, Chelsea, London.

HOTHOUSES, CONSERVATORIES, FRAMES & LIGHTS FOR PITS, CUCUMBER & MELON BOXES & LIGHTS.

JAMES WATTS, HOTHOUSE BUILDER, 8, Claremont Place, Old Kent Road, London.

Green and Hothouses, 9, 10, 11, 12, 13, and 14 feet wide, any length, from 16 to 100 feet. Frames and Lights for Pits, 6 ft. 6 in., 7 ft., 7 ft. 6 in., 8 ft., and 8 ft. 6 in. wide, any length, from 12 to 100 feet. Upwards of 200 Cucumber and Melon Boxes and Lights, from 4 ft. by 3 to 10 ft. 6 in. by 5 ft. 6 in., kept ready, glazed with stout sheet glass, painted four times, complete, ready for immediate use, all made of best material, packed and sent to all parts of the kingdom.—Reference may be had to the Nobility Gentry, and the Trade, in most of the counties in England.

LIST OF GARDEN ORNAMENTS MANUFACTURED IN AUSTIN'S ARTIFICIAL STONE, at Nos. 1 to 4, Keppel Row, New Road, Regent's Park, London.

4 Garden Seats.
15 Sun-dial Pedestals.
16 Shells for either Water or Rock Plants; the largest size is 12 feet diameter.
Pedestals, square, circular, and octagonal, of almost every size. N.B. These are always perforated, to allow drainage from a vase.
43 Groups of Figures, single Figures, or Architectural Flowers, designed for centre ornaments of fountains.
Ornamental Copings to Ground Basins of Fountains, from 37 feet diameter to any smaller size.

FOUNTAINS.

AUSTIN & SEELEY having erected 218 of these works in various parts of the kingdom since the year 1836, may be presumed to have more experience than any other persons engaged in such work. Their collection now comprises about 200 designs, some of which are of the highest class; and they are now paying special attention to this department of the business, in the expectation that the local water works in course of erection will facilitate the supply of *jets d'eau*. The prices range from 10*l*. to 400*l*.

GARDEN VASES, FOUNTAINS, ETC.

THOMAS SOMMERVILLE, LANDSCAPE GARDENER, NURSERYMAN, SEEDSMAN, and FLORIST, Garden Road, St. John's Wood, London, begs respectfully to inform the nobility and gentry, and his patrons generally, that he has entered into arrangements with an eminent company in Scotland for the disposal in London of their highly ornamental and very durable Vases, Fountains, &c., samples of which may be seen at the grounds in the Garden Road, as above.

T. S. has much pleasure in being the first to introduce to the notice of the public a highly ornamental Vase, capable of resisting the most severe weather, and at little more than half the cost of any other possessing the same qualities; and he has no hesitation in stating that a more suitable Vase for the growth of plants cannot be manufactured.

FOUNTAIN BASINS, VASES, STATUES, FLOWER TRAYS, &c. in TERRA COTTA, by J. M. BLASHFIELD, Praed Street, Paddington.

SLATE WORKS, ISLEWORTH, MIDDLESEX.

EDWARD BECK MANUFACTURES in SLATE a variety of articles for Horticultural purposes, all of which may be seen in use at Worton Cottage, on application to the Gardener, Sundays excepted.

Priced Lists of Plant Tubs and Boxes forwarded on application.

TO NURSERYMEN AND GARDENERS.

REIGATE SILVER SAND, 12*s*. per ton, 1*s*. 6*d*. per bushel, or 16*s*. per ton, delivered to any of the London Wharfs or Railways, or within a circuit of five miles. Peat and Loam of various qualities. Sacks 2*s*. each.

KENNARD BROTHERS, Swan Place, Old Kent Road.

ROYAL BOTANIC GARDENS, REGENT'S PARK.

LIST OF PRIZES AWARDED AT THE EXHIBITION HELD ON WEDNESDAY, MAY 9, 1855.

H.M. Mr. Lockyer, Princes Square, Plymouth (Lemons grown in the open air).

PAGE AND CO'S COMPOSITION FOR THE DESTRUCTION OF BLIGHT UPON ROSES, WALL-FRUIT TREES, CUCUMBERS, MELONS, VINES, STOVE AND GREENHOUSE PLANTS.—Extra Strong, 4s. per gallon, sufficient to make four (Jars and Barrels extra). Directions for use forwarded. Ten gallons and upwards carriage free to London.

After four years' extensive use by the most eminent Gardener in the kingdom, the superiority of PAGE & Co.'s BLIGHT COMPOSITION is unquestionable, requiring only a trial to insure its general use for destroying every pest to which Plant and Fruit Growers are subject (without injuring the most delicate flowers or foliage) and promoting a luxuriant growth.

See two pages Testimonials, *Gardeners' Chronicle*, March 3, 1855

M'ADAM AND CO.'S BLIGHT COMPOSITION, now universally used, is sold in packets (with full directions) at 3s. 6d. each, sufficient to make 24 gallons of liquid wash. No Grape, Peach, or Plant grower should be without this invaluable remedy (see *Gardeners' Chronicle*, May 27, June 10, July 1, &c.)—Agent, JOHN HAYNE, 8, Liverpool Street, City, London. Paid orders forwarded.

ITALIAN RYE-GRASS SEED.

SUTTON AND SONS, Reading, having in anticipation of the present great demand for this invaluable article provided an extra large stock of the best quality seed, are still able to execute orders for either Sutton's Improved, Dickenson's, or Fresh Imported Seed, price 7s. 6d. per bushel. Instructions for cultivation are sent with the Seed.—Early orders will be necessary.

The Gardeners' Chronicle.

SATURDAY, MAY 19, 1855.

TILL Wednesday last few persons knew anything of Gore House except that it had once been inhabited by the Countess of BLESSINGTON, and was afterwards desecrated by Monsieur SOYER and his myrmidons. The great Exhibition of Flowers by the Horticultural Society has now explained what the situation really is, and shown how admirably it is adapted for public purposes by extent, by the arrangement of the ground, and, above all, by facility of access from London. And we cannot but express our conviction that the far-seeing wisdom of Her Majesty's Commissioners in obtaining possession of such a site, partly by means of the surplus of the great Exhibition and partly by a Parliamentary grant, will be fully established by the result. The ground in the hands of the Commissioners includes about 86 acres, and is already enclosed on two sides by new roads leading in the direction of Brompton, one of which called "Prince Albert's" will be perhaps the finest near the metropolis. On the north is the Kensington high road, and another is to be made on the south, so that the area in the final occupation of the Commissioners will form an irregular parallelogram, of which the kept ground filled on Wednesday by the Horticultural Society forms a portion of the northern limit. No one who stood upon this spot, and carried his eye over the space bounded by the flags fixed by order of the Royal Commissioners, could fail to see how great are the means at their disposal for the purpose of aiding science and art.

The ground on which the Exhibition took place consisted of the gardens and adjoining field formerly in the occupation of Lady BLESSINGTON and Lady ELIZABETH WHITBREAD, but now thrown into one by command of his R.H. Prince ALBERT, President of the Royal Commission. The space thus obtained was well suited for such an operation as that of the Horticultural Society, and had the day been more favourable, would have formed a charming scene with the large lawns, thinly sprinkled with fine trees, and the numerous tents; but the sun did not shine even once, the air was chilled by a damp atmosphere acted upon by a biting east wind, and the day, although dry, was one of winter not of summer, but we trust the last of such unusual weather as we have experienced.

The QUEEN, accompanied by Prince ALBERT, with

the Duke of Saxe Coburg, the Princess of Hohenlohe, and their suite, visited the garden early, and the exhibitors will gladly learn that her Majesty was graciously pleased, not only to express her satisfaction at the general result of their labours, but at the gradual progress in good cultivation, which their displays annually evince. And even the most critical must admit that such Roses, and such Azaleas, were never seen before, or indeed such fruit in the month of May.

We shall not, on the present occasion, particularise individual exhibitors, of whom a full and separate account will be found in another column, but content ourselves with adding our own humble testimony to that of the distinguished visitors, that such plants and fruits as were on Wednesday produced in spite of every difficulty which could arise out of a most ungenial spring, reflected the highest honour upon the horticulture of England. And this too was the unanimous opinion of the numerous spectators who filled the grounds in the afternoon.

In the last number of the "Quarterly Review," p. 439, in the article "The Forester," the writer offers some advice on the formation and treatment of hedges. For the benefit of such of our readers as may not have perused the article in question, we quote the passage referred to. "If," says the writer, "the last (Quicksets) be selected, it (the hedge) will be rendered more efficacious, though less ornamental, by mixing Beeches with the Thorns, as these trees, when young, retain their withered leaves until spring, affording shelter to the plantation during the budding season, which is the period when their services are most needed. The young Thorns, before being set, should be cut down to about 4 inches above the crown of the root; but the Beeches must be left whole."

Before offering any comment on this passage, we will direct attention to another from the same article, merely requesting our readers to be good enough to compare them. At p. 444, the writer tells us that "The first object is to encourage the trees to root themselves firmly in the ground. A plant should never be required to do two things at once, or one, perhaps both, will be performed imperfectly, and the plant will suffer. On this principle it is a bad practice to prune a young tree severely when transplanted, while to cut it down to the roots is likely to be most pernicious."

Surely the writer must have forgotten the first passage when he wrote the last one. No one will, we think, dispute the very excellent physiological axiom conveyed in the latter; but why it is not as applicable to a Thorn as to an Oak or a Beech, we confess we are unable to perceive. If the act of cutting a Thorn off to within 4 inches of the crown of the root is not severe pruning, what does constitute severe pruning?

The fact is, that when Thorns are planted to form a hedge they should not, except the plants are very large, be cut down, and then but partially. The operation should not be performed till after a year's growth. And we are sure that no one who is desirous of raising effective Thorn hedges would think of mixing Beeches with them; notwithstanding the recommendation of so high an authority as that of the "Quarterly Review." Beeches alone form a very handsome and, if properly managed, efficient hedge; and the same may be said of Thorns, as every-body knows; but if you wish to destroy the efficiency of both combine them in the same fence. If the shelter which a Beech hedge affords, from the circumstance of its retaining the leaves after they are dead, is of value to a young plantation, by all means plant Beeches; there can be no possible reason for destroying its efficiency in this respect by mingling Thorns with them.

We are aware that many persons are in the habit of introducing into the same hedge other plants besides Beech and Thorn; but all such mixtures are to be condemned. Decide upon some one kind of hedge plant most suitable for the particular purpose required, and form your fence of that alone. The practical value of this advice few will dispute. We have said that Thorns when planted to form a hedge should not, except under particular circumstances, be cut down till after they have been established one season. Many excellent cultivators act otherwise we know, but this is more from deference to custom than from any other consideration.

On a large estate with which we are acquainted, where Thorn hedges are planted yearly to a great extent, the practice adopted is as follows. We may add that the hedges there are very rapidly formed, and are highly efficient as fences.

The line of hedge having been marked out, a space 2 feet wide is trenched to the same depth. Upon this 3 or 4 inches of well rotted manure are put, and forked in. Over this forked ground 6 or 8 inches of the soil outside of the trenched ground is cast, so as to give the foundation of the hedge a prominence over the adjacent field. In the ground so prepared the young Thorns, as soon as the leaf is cast in the autumn, are planted, *but not cut down*. Small healthy plants are chosen. Of course a rough fence is placed as a protection. After the plants have, by being planted a season, become well established at root, a handy man with a large pruning knife cuts all the plants down to within an inch or so of the soil. This operation is performed in the spring, just before growth commences. Of course, during the preceding summer no weeds have been allowed to interfere with the growth of the plants. After the first spring pruning is over, all the cut down plants and rubbish are carefully cleared off, and the ground about the plants stirred and "turned in."

During the second season after planting, weeding is carefully attended to. Each plant will of course have made two, three, or more shoots. These are at the pruning season cut hard back, as with the young plants in the previous year. The rich ground will form an admirable foundation for the future hedge, and proper attention only is required to secure an excellent fence.

Common or ordinary plants are unfortunately considered by very many persons as not requiring the same careful treatment as others of greater rarity. Very few cultivators we know think of manuring their hedges. The usual practice of hedge planting, with the subsequent attention which the plants receive, bears out what we have said. A bank of poor soil is thrown up of some 2 feet in height. A number of Thorns, mutilated after the most approved fashion of our reviewer, are stuck in. And this part of the affair, by the bye, is not seldom performed when the plants are in leaf. Upon this bank they dry up, or are starved, constant deficiencies occur, and the misapplied labour of half-a-dozen years produces a hedge in name, but no fence in reality. *G. W. L.*

Our readers cannot but peruse with intense satisfaction the following correspondence, for it shows that political honour and inflexible integrity may find solid support even against influences as powerful as those of an unscrupulous Treasury. The House of Commons has done its duty by compelling the gentlemen who deprived the country of the services of Mr. Kennedy to eat dirt in the most literal sense; and we now see, with admiration, that one of Her Majesty's subjects has nobly stepped forward to proclaim in a most unmistakeable though unostentatious manner that disgust which is everywhere felt at an act of despotism from which even a Turkish Government would have shrunk. We sincerely congratulate the right honourable gentleman and his friends upon so signal a recognition of his wrongs; but we still more congratulate the country upon the continued existence of a public spirit which, though latent, will some day break out and overwhelm those who render good departmental administration impossible:—

"Porthkerry, Cowbridge, South Wales, May 14, 1855.

"Sir,—I shall be obliged if you will be so good as to insert in the columns of the *Gardeners' Chronicle* this note, together with the accompanying copy of a document (the name omitted), the original of which has been recently transmitted to me. I wish to add that I have accepted the gift it confers, and although I am not *permitted* to mention the *name* of the donor, I may state that he is not connected with my family, and that relations of friendship, which have existed between him and myself during the unbroken period of now fifty years, have governed my conduct in this matter.

"I am, Sir, your very obedient Servant,

"T. F. Kennedy."

"To the Editor of the Gardeners' Chronicle."

(*Copy*)

Whereas my friend, the Right Hon. Thomas Francis Kennedy, has been deprived of the office he held as Commissioner of Woods and Forests, mainly, as I believe, from his inflexible zeal in the discharge of the duties of that office, in promoting the welfare of the country, at the sacrifice of influential patronage, and he may not for long, or ever during his life, have that injustice repaired; therefore I, ——, hereby bind and oblige myself, my heirs, executors and successors, and —— to pay to the said Thomas Francis Kennedy an annuity of twelve hundred pounds a year, at two terms in the year, Whitsunday and Martinmas, by equal portions, commencing the first term's payment thereof at the term of Whitsunday, 1855, and so on half-yearly thereafter: Provided always, that in the event of his being appointed to any office, or receiving any pension or allowance in respect of his past services to the country, the said annuity shall be diminished to the extent of the salary of such office, or of such pension or allowance; and I consent to the registration hereof for preservation and execution. In witness whereof I have subscribed these presents, written by ——, at London, the fourth day of May, one thousand eight hundred and fifty-five, before these witnesses, —— and ——.

(Signed) ——.

New Plants.

125. So-called new species of Conifers.

1. *Pinus spinulosa*, Griffith ic. iv., t. 373, is *Abies Morinda*.

2. *Pinus Griffithi*, M'Clelland in Griff. ic. iv., t. 375, is *Pinus excelsa*.

3. *Pinus Khasyanus*, Griff. ic. iv., t. 377, is a very doubtful plant, probably identical with *Pinus sinensis*.

4. Pinus Maderiensis, *Tenore in Ann. des Science, 4 ser. vol.* 2, *p.* 379, is said to differ from the Stone Pine in its very unequal-sided apophysis, with the central tubercle somewhat hooked, not flat, in the leaves being twice as long and occasionally in threes, and in its branches not being upright, but like those of a Pinaster, of which it has the habit. Professor Tenore says he had the seeds 20 years ago from Mr. Fox Strangways as a Pine from Madeira. Is it different from Pinus canariensis?

VEGETABLE PATHOLOGY.—No. LXXII.

310. Chlorosis 5. (*Constitutional and Organic.*) Potato Curl.—It is with some hesitation that I refer this malady to Chlorosis, because I have had no opportunity of studying it properly myself. It is unknown or extremely rare in the midland counties, and indeed does not appear of late years to have been so formidable as at the beginning of the century, though it was said to be very prevalent in 1847 in Potatoes from Bermuda in the gardens of the Horticultural Society, and in other imported varieties. The best account of the disease with which I have been able to meet is in the treatise of Martius, who however knew the disease only from the reports of others, to which I referred some years since in Morton's "Encyclopædia of Agriculture," and in that of Putsche and Bertuch, which I had not seen when that article was written. From an attentive consideration, it seems to me to be a constitutional disease, however it may have been at first contracted. All the accounts are unfortunately deficient in a description of the appearance exhibited by the young shoots, which is the more desirable, as its connection with, or distinction from, a disease described in the following article, which before the occurrence of the Potato murrain was known under the name of the dry rot, and characterised by the frequent decay of the sets, the difficulty with which they shoot, and the imperfection of the shoots when produced, combined with a tendency to produce a few miserable tubers instead of rising into perfect haulm, requires to be satisfactorily ascertained.

311. The curl was first observed in Great Britain in the year 1764, but it soon extended into the provinces on the Rhine, and to other parts of Europe. The most extravagant notions were prevalent as to its cause, one of the most singular of which, and maintained with much violence was that it was due to the impregnation of the finer varieties of Potatoes with the pollen of those kinds which are cultivated for cattle. No more satisfactory result was derived from all the treatises than from the greater part of those with which Europe was inundated in 1845 respecting the Potato murrain. It was, however, observed that settings from crops affected with curl were capable of propagating the malady, and that the safer practice, even where pains were taken to destroy every affected plant, was to obtain seed from a district entirely free from the malady. The disease must, therefore, either be constitutional or must be produced by something inherent in or adherent to the settings, the former of which seems to me the more probable condition on a careful examination of the evidence.

312. The affected plants are at once distinguished by their sickly stunted growth, their simple unbranched stems, their almost sessile leaves, their mottled chlorotic aspect, their distorted shape, and by partial decay of the tissues, affecting not only the external parts but penetrating to the centre, so that the stems perish long before their time. The fruit when produced, which is but rarely the case, for the flowers in general fall off prematurely, is mottled like the stem and leaves, and the tubers which are few in number, if produced at all, insipid and watery, are perfectly useless from the unpleasant effects which they produce. These tubers, like those of Potatoes affected by Potato murrain, do not necessarily reproduce the disease, but together with the greater part of those amongst which they grow they have a tendency to do so.

313. Though the foliage is occasionally much altered and distorted, the name of the disease is quite as much derived from the curved form assumed by the shoots as from the leaves themselves. There is the greater necessity to call attention to this point, because the name is often applied to Potatoes affected by aphis. A few individuals about a plant are quite sufficient to affect the foliage; but even where the appearance of a whole crop is thus affected, the consequences may be altogether immaterial. The aphis is injurious only where it multiplies to excess.*

314. Chlorosis 6. Dry Rot in Potatoes.—Before I proceed to the consideration of this disease, it is necessary to remark that though the popular name is identical in meaning with the affection to which the

* Since the article on the Chlorosis of Hyacinths was written I have had a plant in my possession in which the leaves and stem were distorted with wart-like swellings, the flowers only partially opened, those at the top gradually dying, and the paler portions of the leaves showing a similar disposition. The bulb is unhealthy, but not actually decaying, and the roots, though weak, do not appear unsound. As the decay is beginning to affect the leaves, the whole plant will probably perish.

Germans have given the name of Trocken-fäule, there is no resemblance whatever between the two maladies. It was observed in paragraph (310) that the relation of dry rot to curl has not at present been accurately ascertained. Be this relation, however, what it may, the disease is unhappily too generally known from the great loss which it occasions to the cultivator, and the disastrous consequences which have arisen, more especially in Ireland. The sets when committed to the ground remain either altogether dormant, and then pass into a state of decay, or they produce only weak and distorted shoots which either themselves swell into a miserable tuber, or give rise without any further development to a few diminutive Potatoes, or if the shoot has strength enough to appear above the surface it attains only small dimensions with a yellow chlorotic aspect, and perishes without, however, as far as I have observed, exhibiting any marked distortion. All the tubers from the same seed are not similarly affected; and in consequence the crop in general exhibits a patchy appearance. Now, it is at once evident that every case in which the tubers refuse to germinate is not referrible to the same cause. They may have been heated, salt may have been purposely placed with the Potatoes in the pits to prevent heating, or the Potatoes themselves may be partially decayed from different causes, and in such cases we need not be surprised if the crop fails. The essence of the disease before us consists in the tubers being to all appearance, even on attentive examination, perfectly sound, and yet indisposed to shoot—a condition precisely contrary to that which obtains in tubers affected with the Potato murrain, which are notoriously precocious.

315. One or two of the causes which have been assigned for this affection have already been disposed of. Imperfect ripening of the tubers is one which perhaps would deserve a little notice, if there were any reason to suppose that, in the majority of cases in which it occurs, imperfectly ripened sets were used. This is, however, so far from being the case that the very contrary supposition, of the tubers being allowed to arrive at the most perfect state of growth before their removal from the soil, is a favourite theory with some; founded partly on the fact that imperfectly ripened seeds germinate more readily when committed at once to the ground, than those in which the tissues and their contents have arrived at that condition in which they can retain their vegetative powers the greatest length of time, and partly on the notion that, where the whole or the greater part of the contents of the cells are converted into fecula, there is little or no nitrogenous matter present to facilitate the conversion of the starch grains into a soluble substance capable of affording nourishment with sufficient rapidity to the nascent or dormant eye. It is not, however, observed that where scattered tubers have been accidentally left in the ground, or where whole plants have been left intentionally, there is any difficulty of vegetation, or any want of strength in the young shoots. The practice of greening Potatoes by exposing them to light depends upon this notion; but if it has any effect in producing a flourishing crop, it is probably because such tubers are less liable to decay than others, or less exposed to the attack of such fungi as prey on organisms in which the vital principle is liable to easy derangement. Thus much at least seems certain, that where whole tubers are used in preference to sets, the crops are much less subject to the dry rot. In their natural condition the feculiferous cells are protected not only by the cuticle itself, but by several layers of subcuticular cells, whereas in sets they are completely exposed, and it is very possible that the immediate subjection to the fluids contained in the soil, which may contain matter extremely noxious when absorbed at once by the cells, though harmless when imbibed by the cuticular surface or spongelets, may prove injurious. The whole subject is, however, open to further inquiry; but no result can be expected where preconceived notions or hasty conclusions blind the judgment and prevent a fair examination of comparative phenomena. It is well ascertained by the most careful and competent judges, that in comparison of sets undivided tubers have a great superiority in point of certainty and produce; it is wise, therefore, to follow the experience of such authorities, even though it may entail a little additional outlay; and where parties are obstinately bent on using sets, it may be well to apply lime, or diluted gas-tar, or other matters which appear to protect them from external injury. I have not adverted to the use of raw manure, which, however injudicious it may be in other respects, cannot have any influence in retarding growth. *M. J. B.*

ADVENTITIOUS ROOTS.

It is a fact pretty well established that, in phenogamous plants, adventitious roots are not formed, except where there is vascular tissue under whose vital influence the young rootlet may be developed; and this is no less true of each further division of the root than of the primary axis. An excellent illustration of this was afforded by some Celery leaves which had been accidentally injured, which were forwarded by Mr. William Ford in the early part of 1852, one of which was figured in this journal at the time, producing a mass of roots from a spongy callus generated at the lower lip of the fracture. A single leaf has just occurred to me, producing perfect roots from the fractured surface; but in this case the upper lip of the wound gave rise to the roots, which were uniformly in pairs. A vertical section through the leaf and young rootlet, as in the former instance, exhibited a direct communication of the vascular tissue of the leaf with that of the root, and had nothing more appeared, I should have considered it quite superfluous to call attention again to the matter; but the tissue was so remarkably modified at the point of juncture of their respective fascicles, that it is well worth a few more words.

In the root itself, and in the vascular bundle from which it sprang, the spiral vessels (for true spirals, capable of being unrolled, existed in the fascicles) were straight and showed no peculiarity, but at the point of junction they were highly distorted and branched, often giving off short protuberances, and increased evidently by the swelling out of their sides after the fashion of a branched Conferva, and not by the production of new cells within the parent cell, or the confluence of several, and the subsequent absorption of the dissepiments. The fascicles, too, of each pair of roots were more or less connected. The structure was in fact precisely the same as that represented by Trécul in the abortive adventitious roots of the yellow Water Lily ("Annales des Sciences Naturelles, Nov., Dec., 1854.") though singularly enough those roots which in *Nuphar luteum* break through the bark exhibit no such structure, while their ramifications present merely the obtuse, slightly curved, and incrassated ends of their spiral vessels attached at right angles to the scalariform or reticulated vessels of the main root. As only a single root-bearing leaf occurred in which all the rootlets were well developed, there was no opportunity of observing in what precise manner they were given off, but it is quite clear that the spongy cellular mass produced at the fractured surface had no further part in their production than supplying nutriment and temporary protection to the nascent fascicle from which the new root was ultimately developed.

It is worthy of remark, in connection with the fact of the adventitious roots in the former case arising from ascending fascicles, whereas, in the present, they are due to descending offsets, that in the yellow Water Lily all the adventitious roots are originally ascendant, though eventually those only appear to be in general developed which are on the side which is in contact with

the soil. The figure exhibits four pairs of roots springing from three marginal ribs of the leaf, as seen from the upper surface, the spongy body, in consequence of its obliquity, being completely concealed. The fascicle of vessels alone is represented as seen in a vertical section, not passing directly through the centre, but a little on one side, the bast cells which surround it being entirely omitted as not exhibiting anything peculiar. The outer surface of all the roots was clothed with short delicate hairs, which no doubt are a great assistance to the spongy tissue in imbibing nutriment from the soil. I have nothing to add to the practical inferences which were before deduced from this curious subject. *M. J. B.*

TROPÆOLUM TRICOLORUM.

Than this, few plants possess more real interest; and it is as useful as it is interesting, for it continues to flower nearly the whole season through. It is so easily managed, too, that it may be cultivated successfully in a greenhouse, a pit, or even in a window, if frost is kept from it; and then its curiously formed, lovely red flowers, when once developed, create such a charming display, that any little care bestowed on it during its early growth is amply repaid. Nobody who loves flowers—and who does not!—should be without this valuable little plant, the training of whose tiny shoots over the slender trellis that is destined to support them affords agreeable employment for many an otherwise profitless half hour.

The mode of culture I pursue is as follows. As soon as the plants have done flowering, they are removed to the back of the greenhouse, or to any sheltered place most convenient, and are allowed to dry off gradually. When the stems have become completely dried up, and break from the bulbs, the latter are carefully taken out of the pots in which they have flowered, wrapped in paper, and preserved in a drawer, until the time arrives for their being started again into growth. This will be about the middle of September, when they will have grown a few inches. I then pot them directly into the pots they are intended to flower in. For bulbs from four to five years old, I use 11-inch pots, and smaller in proportion to their size.

The soil which I find to suit them best is a mixture of equal parts of turfy loam and fibry peat, with a portion of well-decomposed cow-dung, and a sufficiency of silver-sand to make the whole gritty. These materials should be well mixed together, and used in a rather rough state. In potting, I employ clean washed pots, and place about 1½ inch of broken crocks over the bottom, with a layer of moss to keep the soil from mixing with the drainage. In filling the pots, I use the rougher portion of the soil first, and the finer as the pots become nearer full. This mode of proceeding secures perfect drainage, which is of the highest importance. My pots filled, and lightly pressed down, I insert my bulbs, leaving their crowns just below the surface; I then give a good watering with a fine-rosed pot, and keep them afterwards moderately damp; but I never allow water to stand in the pans, as they are impatient of much moisture at any time, except when in full flower, and then they require a rather plentiful supply.

I always fix the trellis on the pot at the time of potting, as it saves the roots from being injured, as would happen, if the operation was delayed to a future time. I carefully lay in the shoots as soon as they are produced, and fill every part of the trellis, which is brought over the front of the pot to within 4 or 5 inches of its bottom. This gives them a neat appearance; and a month before they come into full bloom, I contrive to have the shoots equally distributed all over the trellis; for when this is the case, the beauty of the plant is very much enhanced. *Alpha.*

Home Correspondence.

Are Large Boilers Economical?—Messrs. Weeks have, by their advertisement, shown the extent to which they have applied the system of heating numerous houses and pits from a single boiler, and by an assumption of the saving which they calculate would be effected by a more general adoption of it (which, however, has been shown to be not quite correct in the case of the Palm-house at Kew), have re-opened a subject on which discussion has languished since the death of the zealous advocate of the Polmaise plan. But, as I apprehend, the subject can scarcely be considered to be exhausted, if men so practical and of such extensive experience as Messrs. Weeks and Mr. Ayres differ so widely in opinion; and as economy in fuel and attendance cannot be an object of indifference to the many, whatever it may be to the few, especially with the increased price to which these have lately attained, perhaps you will allow me to make a few observations rather with a view to elicit the opinions of the experienced than to express my own, premising, however, that it is a point to which I have given some attention, and that the cost of my experiments, successful and the reverse, falls on my own shoulders. There is perhaps truth in the proverb, that we are apt to attach some, it may be an undue, value to experience which we have acquired at our own expense. The question, then, as far as the public is concerned is (leaving out all extreme cases of very large structures), to what extent a number of separate horticultural buildings may with advantage be heated, hot water being the medium, from a single boiler, as I suppose that few will be found to maintain that each separate house and pit will require a separate boiler. This naturally divides itself into two sections: the first the original cost of one boiler with the additional connecting pipes and stops, in comparison with a less quantity of pipes and stops, and an additional number of boilers and setting; the second, the loss of caloric along the extra conveying pipes in the first, against the escape from the chimneys and furnaces in the other. The objections offered by Mr. Ayres are important; and if they were without remedy the subject would seem to admit of no further discussion. But are they so in reality? Take, for instance, the one to which I attach the most importance, the bursting of the boiler; and as I have not escaped this calamity I know how to sympathise with others in the same predicament. But if instead of one large boiler two of an equal aggregate capacity were placed in juxtaposition, so that the same chimney and one setting were available for both, with stops connecting with the same main flow and return pipes, a precaution against the worst disaster arising from the bursting of a single boiler is secured, and other advantages obtained; for, as both of the boilers could be worked separately or together, the control over the heating power would be much more complete; and as one supply of fuel would serve, scarcely any appreciable extra attendance would be required. I am of course presuming that the houses and pits to be heated are in such proximity that the mains can be connected with each without being carried to wasteful distances. And this brings me to another of Mr. Ayres's objections—the expensive connecting valves, and the trouble of attending to them. If a valve cannot be had for less than 42*s.*, perhaps one might pause to consider; but if the alternative be a valve or a boiler, perhaps the balance might be in favour of the former, even at that price. I think, however, nay, I know, that a simple and effective stop may be had for much less. If it be required to keep several houses and pits at given or varying temperature, it will be as necessary to attend to, and vary the supply of heat as frequently, if each house have a separate boiler, as if they have one in common, always, of course, supposing the command of a sufficient amount of heat for the whole; but where in general practice is this excessive nicety observed? Is it, indeed, essential? If so the almost hourly attention is in either alternative equally so, with our constantly varying changes in the external temperature during the 24 hours. The relative temperatures may easily be secured by the quantity and arrangement of the pipes laid in the respective houses. I do not intend to question the axiom advanced by Mr. Ayres, that a given quantity of fuel

contains a specific amount of caloric (the whole of which, I will add, is evolved in combustion, whether the proce-s of combustion be fast or slow), and that a given body of water requires a certain amount of fuel to heat it to any given temperature (varying, of course, under different conditions); and that that boiler which absorbs or extracts (I should rather say is the medium of conveying to the pipes, not necessarily synyonmous terms), with the least loss of heat from the door and chimney, is the best; no matter the form, nor is it at all material whether one boiler or half a dozen be employed, so that the object be attained. Here, however, the field of discussion begins, as to which form and arrangement will do the most effectually; and although it forms the question at issue, I will not trouble you with any lengthened theory of my own; only observing that as three sorts of material may be used for fuel, perhaps no one form or arrangement is equally best for all, but as local position will determine—whether coals which cake together during combustion; or those which do not, and coke and cinders; and, lastly, wood, and perhaps peat, be the fuel used, so do I incline to think that each will require a different arrangement from the other two for the most effective application of the caloric. The extreme case to which Mr. Ayres alludes, of a pit at Messrs. Weeks's being raised in a few minutes to 60° at a distance of 365 feet from the fire, I suppose is given by them to show that even at that distance they have a command of heating power. There is little fear that under a management far inferior in intelligence to that of Mr. Ayres, such an oversight should occur as to render it necessary to heat a large boiler and 750 feet of pipes for the sake of a solitary pit; indeed there are few establishments where several glass structures are in use, and where bottom as well as atmospheric heat is derived from hot water, where firing can be entirely dispensed with for many days together the whole year round. Surely then a case arises for consideration, to what extent several separate horticultural structures may with advantage be heated from a single source, especially where new buildings are being erected, or old ones rearranged. *T. K.*

Advantage of Larch.—I have not a leaf out of any tree (not even the Sycamore) excepting the Larch, all of which, even 200 feet above the other deciduous trees, are in full leaf. *Somerset, May* 12.

Crithmum maritimum.—Permit me to ask if "Samphire" is not the common English name of this plant. [Yes.] The French call it "Percepierre" or "Fenouil marin." It grows plentifully amongst the rocks on the coast of Brittany, as I once learnt to my cost. Having given a franc to a soldier whogathered a basketful for me, his example was followed by so many of his comrades, that I was forced to stop payment long before their zeal in the "dreadful trade" was exhausted. I was not aware that the name of "Percepierre" was used in England. *J. M. C.*

Vinegar Plant.—I have lately had this plant given me, with the following receipt:—"To 2 quarts of water add ½ lb. of coarse brown sugar, and ¼ lb. of treacle; boil them together; when quite cold throw it into the jar on the plant. Tie perforated paper on the jar, and let it remain undisturbed two months—three months will be better." It strikes me that in some former number of your Paper, when speaking of the adulterated vinegar sold by tradesmen, you recommended the making of vinegar with this plant. Pray is the above receipt a good one—is there a better *modus operandi?* How long after its being separated from the mother plant can the new one remain before being used? If taken out during the time prescribed, for a minute or two, will any evil arise?—this has been the case with a friend of mine. If not encroaching too largely on yonr time, might I ask you for some little description of this plant, as to its genus, &c., and discovery. *N. A. P. B.* [We have no experience in the matter. The plant itself is the mycoderm, or mothery matter of a mould called Penicillium glaucum.]

Result of not Protecting Wall Trees.—Like your correspondent, Mr. Henderson, of Coniston, Yorkshire, I have always covered my Apricot trees with canvas, netting, &c.; but six years out of seven I have failed in obtaining a good crop. I determined, however, this year not to use any covering whatever, and take my chance; I have this day, May 15, looked over my trees, and I am glad to say that I have an excellent crop. I can count 50 in a square foot, not in the least hurt by the spring frost, particularly that of the 5th inst.; they are as fresh and green as any one would wish to see, I have never seen so good a crop before. My Peaches and Nectarines are apparently equally good; our wall is a very old stone one about 12 feet in height, with no projecting coping. *George Archer, Gardener, Finedon Hall.*

The Frost in Italy.—On the 27th of April the frost was so severe at Naples that all the Tomatoes were killed, excepting those few close to the sea, and sheltered by reed screens; even the Vines suffered. At Salerno, still more south, the wind was as cold as in March in London, and snow fell on the lowest hills around. Near Nismes the Olives are all killed as far as the branches go; it is too early to tell if it has reached the stems. The poor farmers are cutting back the trees just as we do Apples for grafting. It thus appears that the severity of the past winter has been widely felt, and the disasters occasioned by it will, in all probability, long live in the recollection of many. *Somerset, May* 12.

Foreign Correspondence.

Guatemala, *March* 2, 1855.—I went on the 5th of last month to Los Nubes (the Clouds), reached them in seven hours, and literally I found myself in the clouds. The altitude of the mountains may range from 7000 to 8000 feet above the level of the sea, or perhaps a little more. The soil is very light, but dark exquisite mould and rich pasture. On the ascent (about 3 miles) were patches of Cypress covering spots on the barrancas, forming triangles and very remarkable from their foliage; not another tree mixing among them, and yet only in two or three spots were distinct or solitary trees observable. As we ascended I was particularly struck with the intense scarlet of a plant of which seeds have gone home, and also of Fuchsias, but only two species, pygmæa and elegans. I took up my quarters in a new rancho building, and fear I passed as uncomfortable a time of it as our Crimean folks. The cold was intense, and in the morning the ground was quite white and the Grass crispy, such as we have in October in England, but, oh! what a glorious day, and how delighted I was with my trip of three days! The Oaks are 100 to 150 feet high, covered with Lichens, Mosses, Tillandsias, and Orchids, Epidendrum vitellinum, Odontoglossum cordatum, and Arpophyllums, with some fine varieties, really very beautiful, of Epid. arbusculum; one species I now send to England, with white lip tipped with brilliant pink. Odontoglossum cordatum was in great beauty. What a glorious free-flowing thing this is!—each bulb has two flower stems, and few less than a dozen to twenty flowers on each, and in masses presenting quite a Chiswick bank; but how to get them down was the difficulty, and I risked my neck two or three times, for I am not so nimble on a tree as I used to be 20 years ago; but the excitement was irresistible. From one tree, the only one with the assistance of ropes and two Indians which was at all scaleable, we culled about 200 fine plants, and then we had to get men to fell the trees—the only means of getting good plants—which costs about five to six hours' hard work to accomplish; but what a store-house these mountains present! I have risked four boxes now to England to Mr. Veitch, and refer you to him for a share for the gardens, as well as of all the seeds I made collections of, evergreens, &c. My advice as to the growing successfully of Odont. cordatum, Epid. vitellinum, and Arpophyllum, is to pot them in fibry peat or light mossy stuff mixed with leaves and woody fragments, and place the pots in a saucer with water, keeping it every evening well supplied. Try some of all these plants in a greenhouse, and some out of doors during the summer, when showing flower, as much exposed to the sun as you can; for I found the most brilliant colours where most exposed and free from shade. The sun during the day was very hot, yet in the shade I am sure the thermometer would never reach 60°, and after sun-down the exhalation from the ground was excessive, even freezing after 8 or 9 o'clock, during my visit; the day I left, however, the whole mountains were again enveloped in their accustomed clouds, and rain for four days succeeded. I was so benumbed the last night with the cold that I caught a touch of rheumatism, and resolved to seek a melter on the coast. A ride of five hours took me into a climate of 80°, and I spent three days at Escuintla, where I made a collection of Oncidium ampliatum, Epid. Stamfordianum, E. macrochilum roseum, three varieties, &c., and many seeds, some very remarkable, particularly in Convolvulaceæ, all of which have gone by this mail. Ascending near St. Pedro de Martyr I observed a remarkable Pitcairnia quite four miles off, of course without knowing what it was; but the intenseness of the scarlet shining out on the bare rock and burnt-up grassy face of the precipice arrested my attention. I spent two hours after the search, and, with a difficulty only such as a determination to get a prize could warrant, succeeded in bagging four plants. I do not think it new; but, never mind, it is a glorious beauty, and may be new, as I never sent it before, for I never saw it accessible. The Epidendrum which I sent last year I now repeat fine specimens of, preserved through the year in barrels to acclimatise them; and as the season is now when it is again in flower, I have sent two Indians to Retalente for more. One of those Indians always has accompanied me, and as he has learned to make a herbarium, he has my boards and drying paper with him to collect all flowers and seeds which I can here weed if I like. The Antigonum grows luxuriantly at Yzabal, and I will conduct it to England in June next, when I hope to shake you once more by the hand, although I only mean to pass a couple of months, as my duties call me imperatively back again. The plant like Odont. cordatum, but larger bulbs, &c., I could not meet with a single example of; my only two plants go now to Mr. Veitch. *G. U. S.*

Societies.

Horticultural: Exhibition at Gore House, *May* 16.—On this occasion there was such a display of perfect gardening as perhaps was never witnessed before. Stove and Greenhouse plants were furnished in abundance, and the brilliancy and beauty of the Orchids have seldom been surpassed. The great banks of Azaleas and Roses struck everybody with admiration, and even fruit, considering the unfavourable spring we have had, was wonderfully good.

In collections of 12 Stove and Greenhouse Plants, the first large Gold Medal was awarded to Mr. Dods, gr. to Sir J. Cathcart, Bart., of Cooper's Hill, Englefield Green, for the following, viz.:—

Adenandra speciosa	Erica Cavendishi
Azalea, double red	Eriostemon myoporoides
" exquisita	Epacris grandiflora
Aphelexis macrantha purpurea	Gompholobium barbigerum
Boronia pinnata	Leschenaultia formosa
Chorozema ilicifolium	Pimelea spectabilis

These were all large and beautiful plants. The Cavendish Heath was an immense bush literally covered with flowers and the same may with justice be said of the Boronia, which was perhaps one of the best plants of the kind ever shown. The Adenandra was an admirable example of good plant growing, and so was the Gompholobium, whose large yellow flowers were much admired. The showy Pimelea was scarcely in full blossom; but it was a fine specimen, as was also the double red Azalea. In short the whole of this group was composed of fine plants.

Mr. Green, gr. to Sir E. Antrobus, Bart., of Cheam, was second. His plants were:—

Aphelexis purpurea	Eriostemon intermedium
" macrantha purpurea	Epacris miniata grandiflora
Azalea, double red	Franciscea calycina
" Iveryana	Pimelea spectabilis
" purpurea	" Hendersoni
Daviesia umbellata	Polygala Dalmaisiana

The most remarkable plant in this collection was decidedly the Ivery Azalea, which was literally one mass of white blossoms, faintly streaked with purple. This was, as well it might be, the admiration of everybody. The double red Azalea was also a remarkable plant, but it was too stiffly trained to please some tastes, and certainly a little more freedom might have improved its appearance. The Pimeleas were fair specimens of the kind, and the Franciscea was also a good plant, as were most of those of which the group consisted. Indeed, the great distinguishing feature of the show was that there was not a bad plant in it.

Another collection of 12 came from Messrs. Fraser, who sent:—

Adenandra speciosa	Eriostemon scabrum
Azalea speciosissima	Erica pinifolia rosea
" Fielderi	Gompholobium barbigerum
Aphelexis spectabilis	Leschenaultia formosa
Boronia serrulata	Pimelea spectabilis
" tetrandra	Polygala Dalmaisiana

These were all evenly-matched plants, and in good condition. The Boronias were healthy and well grown, more especially B. tetrandra, which was one of the best plants of the kind we have seen. The Eriostemon scabrum was also a well cultivated plant of this comparatively slender growing species. The yellow Gompholobium was likewise a handsome bush, and so was the Fielder's white Azalea, which in some respects is considered superior to the common white.

A fourth collection of 12 stove and greenhouse plants was contributed by Mr. Barter, gr. to A. Bassett, Esq., of Stamford Hill. This group consisted of—

Adenandra fragrans	Gardenia intermedia
Clerodendron squamatum	Ixora crocata
Chorozema ilicifolium	Leschenaultia biloba
Erica Cavendishi	Pimelea Hendersoni
Eriostemon neriifolium	Polygala acuminata
Franciscea confertiflora	Stephanotis floribunda

These plants, as a whole, were scarcely in perfection, some of them being insufficiently advanced in bloom, while others were rather past their best. This remark especially applies to the Cavendish Heath and the Gardenia. The best plants were the Stephanotis and Ixora, both of which were well flowered, and the Adenandra was good, though its blossoms were hardly out enough.

Collections of 6 Stove and Greenhouse Plants were contributed by Mr. Carson, gr. to W. F. G. Farmer, Esq. Messrs. Fraser, Mr. Cutbush, Mr. Morris, gr. to Coles Child, Esq.; Messrs. Rollisson, of Tooting; and Mr. Rhodes, gr. to R. Philpots, Esq., of Stamford Hill. In these groups were well grown plants of Stephanotis floribunda, Everlastings, Dipladenia crassinoda, Eriostemons, Leschenaultias, Statice Holfordi, the same which was shown in Regent Street three weeks ago, still fine in bloom; Brachysema acuminata, a grey leaved plant, with deep crimson flowers; Gardenia florida, Boronias of different kinds, Chorozemas, Pimeleas, Tetratheca verticillata, a useful violet flowered plant, Dracophyllum gracile, Epacrises, and Azaleas.

Orchids were numerous, well flowered, and unusually fresh and beautiful. In collections of 20 plants, Mr. Williams, gr. to C. B. Warner, Esq., received the highest award, for—

Aerides Warneri	Dendrobium macrophyllum
" affine var.	Lycaste Skinneri
" virens	Oncidium ampliatum
Calanthe veratrifolia	Phalænopsis grandiflora
Cattleya Mossiæ	Phaius Wallichi
Chysis bractescens	Saccolabium retusum
Cypripedium barbatum	Vanda suavis
Dendrobium densiflorum	" teres
" nobile	" tricolor
" pulchellum	" insignis

Among these, Vanda suavis was an excellent plant with two noble spikes of flowers; V. teres was likewise good for that species. The Lycaste Skinneri had 20 blossoms on it; and the different examples of Aerides, &c., were also well flowered.

Mr. Woolley, gr. to H. B. Ker, Esq., of Cheshunt, produced—

Aerides virens	Dendrobium nobile
" maculosum	" macrophyllum
Calanthe veratrifolia	" pulchellum
Cattleya intermedia	Epidendrum crassifolium
" Mossiæ	" rhizophorum
" Skinneri	Lycaste Skinneri
Cypripedium barbatum	Oncidium sphacelatum
Cyrtochilum filipes	Phalænopsis grandiflora
Dendrobium Paxtoni	Vanda tricolor
" densiflorum	" insignis

The Vandas and Cattleyas in this group were especially remarkable; so were the Dendrobes. The Epidendrum rhizophorum was much admired for its bright orange-scarlet flowers, a colour so scarce among Orchids.

Collections of 10 ORCHIDS were furnished by Mr. Gedney, gr. to Mrs. Ellis, Mr. Clarke, gr. to Mrs. Webb, Mr. Carson, Mr. Hume, gr. to R. Hanbury, Esq., Mr. Green, gr. to Sir E. Antrobus, Bart., and Mr. Summerfield, gr. to J. S. Venn, Esq. In these groups we observed good plants of Phalænopsis amabilis and grandiflora, Brassia verrucosa and maculata, Vanda teres and insignis, Chysis bractescens, Oncidium leucochilum, sphacelatum, ampliatum, flexuosum, altissimum, and phymatochilum, Saccolabium guttatum, retusum, and præmorsum, Aerides virens and crispum, Dendrobium pulchellum, Dalhousieanum, nobile, Calceolaria, and densiflorum, Cattleya Mossiæ, intermedia, Skinneri, and Forbesi, Phaius grandifolius, Epidendrum macrochilum, crassifolium, longipetalum, and aurantiacum, Cyrtochilum stellatum, Cœlogyne asperata, Arpophyllum giganteum, Calanthe veratrifolia, Ansellia africana, and Lycaste Skinneri. The Arpophyll mentioned here had seven flower spikes on it, which, although small, served to show how beautifully the little shell-like blossoms are arranged on the spike. It is seldom that one sees a fine specimen of this plant; but when well grown and bloomed, it is a really handsome Orchid.

Collections of 15 ORCHIDS, both well flowered, and remarkably showy, were contributed by Messrs. Veitch and Rollisson. The former produced:—

Aerides virens	Dendrobium densiflorum
Calanthe veratrifolia	" Farmeri
Cattleya Skinneri	Oncidium ampliatum
" ianthina	Phalænopsis grandiflora
Cypripedium barbatum	Trichopilia coccinea
" villosum	Vanda insignis
Dendrobium nobile	" suavis
" anosmum	

The Dendrobium anosmum in this group had on it two very fine spikes of flowers, which are handsomer than those of D. macrophyllum, which it resembles, and they are without the Rhubarb smell which belongs to the last-named species. The Vandas were all of them well managed plants, more especially V. suavis, and so were the Lady's Slippers (Cypripediums), C. villosum being covered with flowers which, although not very showy, last a long time in perfection. The red Trichopil was extremely well coloured. The blossoms of the Dendrobium nobile, which was large and fine, were scarcely out enough. On the whole, this collection may safely be pronounced to be the best that has been shown this year.

Messrs. Rollisson had—

Cattleya Aclandæ	Maxillaria tenuifolia
Cypripedium Lowi	Oncidium sphacelatum
" barbatum	Phalænopsis grandiflora
Cyrtochilum stellatum	Sobralia macrantha
Dendrobium chrysotoxum	Trichopilia coccinea
" nobile	Vanda insignis
" Dalhousieanum	" teres
Lælia purpurata	

The most conspicuous plants in this group were the Oncidium sphacelatum, which was large and beautifully flowered, and the Sobralia, which had a dozen blossoms on it. The Dendrobium chrysotoxum was also a well-flowered plant, of a beautiful yellow species. The pale lemon-coloured Cyrtochilum was good of its kind, and the beautiful Lælia purpurata was greatly admired. The Low Lady's Slipper had three flowers on it. In short, this was altogether a group of fine plants.

AZALEAS entirely filled one side of a tent upwards of 50 yards long, and as the plants were large bushes, literally masses of flower of nearly every tint and colour, the kind of effect they produced may be easily imagined. Collections of them were furnished by Messrs. Lane, Fraser, Carson, Barter, Clarke, Gaines, Bray, Rhodes, Pamplin, and Wood. Mr. Bray's plants were again in the form of standards. Among the different varieties were good plants of the Chinese yellow and its white variety, the Duke of Devonshire, coronata, Perryana, Carminata, decora, lateritia, variegata, Exquisite, Gledstanesi, Aurora, Broughtoni, Double red, triumphans, speciosissima, grandis, and Fielder's White. In Mr. Carson's collection were some extraordinary plants, more especially one of variegata, which was quite a column of flowers. Mr. Lane's plants were grown in the "natural style," with very little staking or tyeing, and some of them had two or three sorts united in one plant, whose different colours produced a varied and pleasing effect. Messrs. Rollisson had their new Empress Eugenie, whose flowers are well shaped and good in colour, and Messrs. Lee sent a promising white kind with faint purple streaks in it, called Leeana.

Groups of RHODODENDRONS were produced by Messrs. Lane and Gaines. The former had a large and fine specimen of the fragrant R. Gibsoni; also a yellow variety; a buff sort called Sabinianum; primulum elegans, a yellow; nivalis, white; and a pink kind with a good truss named superbum angustum. Mr. Gaines showed Empress Eugenie, a delicate pink sort spotted with crimson; perfection, purplish lilac; triumphans, rosy pink; aureum (Gaines'), delicatissimum, and Marie Taglioni. The last two are both light kinds. Messrs. Standish and Noble showed one of the best flowered plants of the Sikkim R. Edgeworthi ever yet seen. It was in the shape of a standard whose head was furnished with 15 large white blossoms, which are delightfully fragrant. We also noticed from the garden of Mr. Farmer a good plant of the Gibson Rhododendron, called R. formosum; and Messrs. Veitch had trusses of some handsome new hybrids, among which conspicuum and guttatum pictum are especially worthy of mention.

Of tall CACTI, a small group was furnished from the garden of Sir E. Antrobus, Bart. It contained the white Epiphyllum grandiflorum, E. Jenkinsoni, speciosum elegans, Greeni, and a variety of Ackermanni.

ROSES in pots, both from nurserymen and amateurs, were unusually fine. Those from Messrs. Lane were literally pyramids of flower; among them the more remarkable were Coupe d'Hebe, which we need not say is one of the best shaped Roses in cultivation; Chênèdolé, a more brilliant kind, but not so good in form; Lamarque, a free flowering white climbing Rose; Paul Ricaut, whose buds are of the richest crimson, but unfortunately before they are more than three parts open their fine colour begins to lose its brilliancy; Queen was also in fine condition, and so were Lady Stuart and Paul Perras; Géant des Batailles was not in good colour. Mr. Francis's plants were also very full of flower. Mr. Busby, gr. to J. Crawley, Esq., A. Rowland, Esq., Mr. Terry, gr. to Lady Puller, and Mr. Sage likewise had beautifully flowered Roses in pots, although smaller in size than the above.

Of new ROSES Messrs. Paul, of Cheshunt, had a collection of 30 kinds. Conspicuous among them were Paul's Prince Albert, a brilliant coloured Bourbon with large smooth petals, nicely cupped; Adam Paul, rose colour, large and full, and very sweet; General Castellane, brilliant crimson; Jules Margottin, bright cherry colour, apparently a very free hardy Rose; Lady Stuart, flesh colour; Leon Plée, large bright rose; Madame Duchere, blush; Madame Philip, blush, with rosy edges; Paul Dupuy, dark purplish crimson, very velvety; Prince Leon, large bright crimson, a very fine Rose; Leveson Gower, dark ruby red, large; Triomphe de Paris, velvety purple; Volta, large glossy rose; Louise Odier, bright pink, blooming in clusters. All the above, with the exception of the first, are H. Perpetuals. Tea-scented, Auguste Vacher, yellow, shaded with copper colour; and T. Sombreuil, large creamy white, very double. There were also some other fine kinds, such as Baronne de Kermont, Duchess of Norfolk, which may make a brilliant pillar Rose, and Paul's Helen.

Of CAPE HEATHS, excellent specimens were furnished by Messrs. Rollisson, Barter, Fraser, Veitch, Cutbush, and Rhodes. Among the different varieties were propendens, perspicua nana, vasiflora, elegans, favoides elegans, Sindryana, an upright-growing kind, fastigiata lutescens, florida, ventricosa magnifica, mutabilis, Beaumonti, Devoniana, nitida, vestita rosea, mundula, denticulata moschata, pinifolia rosea intermedia, and Bruniades. The latter, a fine plant, came from Messrs. Veitch.

Of NEW PLANTS, Messrs. Henderson, of Pine-apple Place, and Mr. Lane sent Andromeda formosa; Messrs. Veitch, Embothrium coccineum; and Mr. Tegg, gr. to Baron Hambro, a species of Hoya, in the way of the old carnosa. Messrs. Veitch also showed as a plant not in flower, Aralia papyrifera, the Rice paper plant.

Among MISCELLANEOUS THINGS were nice plants of Genetyllis (Hederoma) tulipifera from Messrs. Garraway and Mayes, of Bristol, and Messrs. Veitch; Caladium bicolor splendens, in flower, from Mr. Morris, gr. to Coles Child, Esq.; a profusely-flowered example of the lilac Tetratheca ericifolia from Mr. Green; and various New Holland and other plants from Messrs. Henderson, of Pine-apple Place. In the last-mentioned group were Gastrolobium calycinum and Drummondi, Pultenæa ericifolia, a so-called new Osmunda, yellow and red-flowered Grevillias, some well grown Eriostemons, two Rhopalas, Boronia Drummondi, three kinds of Stylidium, Rhododendron glaucum, Chironia glutinosa, and cut flowers of Verbena "Mrs. Woodruff," a variety in the way of Robinson's Defiance, but with much larger flowers, and very brilliant in colour.

PELARGONIUMS were exhibited in considerable numbers. By far the best collection came from Mr. C. Turner, of Slough. This consisted of 12 large and finely bloomed plants of Carlos, a large bold flower, with dark top petals and white centre, very fine; Basilisk, bright scarlet; Governor-General, rosy scarlet, very fine; Sanspareil, a spotted variety; Lucy, lilac rose, dark top with white centre; Magnet, red, and very showy; Queen of May, a fine plant of bright orange colour; Rival Queen, rose, and very free; Majestic, dark; Clara, rose; Magnificent, a fine specimen; and Exactum, white. Mr. Dobson, of Isleworth, sent 12 nicely bloomed plants, but they were deficient in foliage, and the flowers of many of the kinds were small. They consisted of Harriet, very well bloomed; Vulcan, Exhibitor, Eugenie, Rosamond, Delicatum, a free flowering white kind but deficient in spot; Pacha, Arethusa, Salmon, this should not be shown in the same collection with Harriet; Leah, a good flower, with white centre; Gulielma, Painter improved, and Ambassador. The latter is a dull variety, which can now be well dispensed with. Mr. Gaines, of Battersea, had Flying Dutchman, Admiration, Andover, First of May, Star, Peerless, Queen of Purples, a bad plant of a worthless variety; Triomphe de la Tour, Colonel Fossey, Jaques Duval, Gustave Odier, and Glorie de Belle Vue; the latter five are spotted continental varieties. There were but two collections from private growers. Mr. Windsor, gr. at Kidderpore Hall, Hampstead, sent Enchantress, a fine plant, but not in good bloom; Forget-me-Not, Ajax, Constance, Emily, Ariadne, Conspicuum, Nonsuch, Lallah Rookh, Pearl, Little Nell, and Virgin Queen. Mr. Todman, gr. to Mrs. Buckmaster, sent 12 as follows, but they were but indifferently done, viz., Loveliness, Beatrice, Rolla, Mochanna, Constance, Ariadne, Crusader, Negress, Sparkler, Governor, Virgin Queen, and Aspacia. There were six collections of Fancy varieties, three from nurserymen and three from private growers. Mr. Robinson, of Pimlico, sent 6 clean and nicely bloomed plants of the following kinds: Delicatum, large and well bloomed; Fairy Queen, Erubescens, Mirandum, Formosissimum, and Princess Alice Maud. Mr. Windsor had 6 very large well grown plants, but of inferior varieties, without a good head of blossom. They were Magnificum, Caliban, Madame Miellez, Duchesse d'Aumale, Fairy Queen, and Statiaski. A third collection came from Mr. Barter, gr. to A. Bassett, Esq., of Stamford Hill, but both plants and varieties were much below mediocrity.—In the Nurserymen's Class, Mr. C. Turner contributed 6 finely bloomed specimens, consisting of Madame Sontag, a noble plant of one of the best kinds, being bright rose, with clear white centre; Cassandra, violet crimson; Criterion, crimson; Gaiety, white and maroon; Delicatum, light; and Electra, bright rosy crimson. Messrs. Fraser, of Lea Bridge Road, had 6 small but nicely bloomed plants of the following sorts:—Jenny Lind, Formosissimum, Richard Cobden, Jehu Improved, Exquisite, and Nepaulese Prince. Mr. Gaines had 6 large well-shaped plants, but they were not in good bloom. They were Advancer, Delicatum, Vandyke, Princess Galitzin, Princess Alice Maud, and Signora Castigloni. A wonderfully fine plant of Rosamond was shown by Mr. Turner as a single specimen. It was in an 8-inch pot, and quite a bouquet of flowers.

CINERARIAS were exhibited by Mr. C. Turner, Mr. Beck, and Mr. Dobson. The two first collections consisted of extremely well-grown plants. Mr. Turner had Magnum bonum, rich crimson, with white ring round the disc, a very large variety; Lady Paxton, white tipped with rosy lilac, large, with small black disc; Optima, white tipped with blue, a finely formed flower; Mrs. Sidney Herbert, white and rose; Picturata, white and crimson purple, very attractive, and fine in form; and Teddington, rosy lilac. Mr. Beck produced Lady Camoys, Amy Robsart, Eugenie, Agnes Wakefield, and Exquisite.

PANSIES in pots were shown in very good condition, and were, as they deserved to be, much admired. The blooms on Mr. Turner's collection were particularly large and good in colour. The sorts were Sovereign, yellow; Emperor, yellow ground; Royal Albert, dark self; Ophir, yellow; Earl Mansfield, white ground; Brilliant, yellow ground; Royal Visit, white ground; Sir J. Paxton, straw ground; Flower of the Day, dark; Satisfaction, yellow ground; British Queen, straw ground; and Lord J. Russell, yellow ground. The varieties in Mr. Dobson's collection, dissimilar to the above, were Fanny Kemble, Lady Carrington, Robert Bruce, Aurora, Lady Emily, Marchioness of Bath, Great Western, Marion, and Rising Sun.

Of CALCEOLARIAS there was one collection, which was exhibited by Mr. Bray, gr. to Baron Goldsmid, of Regent's Park. They were well bloomed, but the varieties appeared to be no improvement on kinds we have seen for these last six years.

AURICULAS were produced by Mr. Willmer, of Sunbury, and Mr. C. Turner. Among these there appeared to be a deficiency of good selfs and white edges, and a preponderance of grey and green edges. Of Selfs there were Oxonian and Mango. In white edges, Pillar of Beauty, Smiling Beauty, and Catherina. Grey edges consisted of Chatham's Lancashire Hero, Squire Chilman, Duke of Cambridge, Ringleader, Ne Plus Ultra, Conqueror of Europe, Privateer, Lady Mildmay, Napoleon, and Liberty. Of green edges, there were Smith's Britannia, Lovely Ann, Prince of Wales, Apollo, Lord Nelson, and Conductor. Mr. Gaines sent a large collection of Cut Mimulus, some of which were very prettily marked. Mr. Kinghorn furnished two promising variegated Geraniums; these appeared to be good growers, and possessed good scarlet flowers. Dennis's Alma is also a showy purple.

Of FRUIT there was a fair display, considering the unfavourable season we have had. Of Providence Pine-apples, two good fruit came from Mr. Robinson, gr. to Lord Boston, and Mr. Clements, of Oak Hill, East Barnet. The former weighed 7 lbs. 4 oz., and the latter 5 lb. 5 oz. Mr. Price, gr. to W. Foreman, Esq., had a Queen weighing 4 lbs. 5 oz.; Mr. Clements, a Black Jamaica, weighing 3 lbs.; and Mr. Fleming, gr. to the Duke of Sutherland, at Trentham, a Moscow Queen, weighing 2 lbs. 3 oz. Two Ripley Queens and an Enville came from the Duke of Norfolk's at Arundel; and Mr. Davies, gr. to J. Dixon, Esq., had a Black Jamaica.

GRAPES were good, especially Black Hamburghs. Of these, considerably the best were furnished by Mr. Clements. These were large both in bunch and berry, and finely coloured. Mr. Slowe, gr. to W. R. Baker, Esq., and Mr. Dods, gr. to Sir J. Cathcart, Bart., also had fine bunches of this variety, and so had Mr. Fleming, Mr. Munro, gr. to Mrs. Oddie, Mr. Breadley, gr. to Sir S. M. Peto, Bart., and Mr. Spary, of Brighton. The latter were comparatively small bunches, but remarkably well coloured. Mr. Mitchell had also bunches of Black Hamburgh, and so had Mr. Brown, gr. to Colonel Biddulph, M.P. The latter were stated to have been grown in pots. Black Hamburghs, badly coloured, came from Mr. Sharland, gr. to T. Farmer, Esq., of Gunnersbury, and Mr. Smith, of Roehampton, also sent examples of this variety. Among white Grapes the Frontignans from Mr. Breadley were ripe, but the Sweetwaters from Mr. Clements, and

the Royal Muscadines from Mr. Ward, gr. to W. Stephens, Esq., had scarcely attained that condition. Mr. Constantine had some well fruited Vines in pots, most skilfully dwarfed, and the admiration of everybody. The sort was the white Muscadine.

Peaches and Nectarines came from the Duke of Sutherland's garden at Trentham. The Nectarines were the Murray and Elruge, and the Peaches the Royal George. May Duke Cherries also came from Trentham, and that variety and Black Circassian from Mr. Ingram, gr. to Her Majesty at Frogmore.

Strawberries were plentiful, large, and well coloured. Mr. McEwen, gr. to the Duke of Norfolk at Arundel, contributed a collection in which were Eleanor, British Queen, and Victoria; and of single dishes Mr. Cox, gr. to J. Hodgeson, Esq., sent Keens' Seedling; Mr. Constantine, gr. to C. Mills, Esq., Prince of Wales; Mr. Smith, of Twickenham, Keens' Seedling, and dishes of the same variety were also furnished by Mr. Lane, gr. to J. Palmer, Esq., Mr. Drummond, gr. to S. L. Stephens, Esq., Mr. Iveson of Syon, Mr. Lane of Fulham, and Messrs. Tyne & Son of Hounslow.

Mr. McEwen exhibited a dish of Rivers' Perpetual-bearing Raspberries; small fruit, but well ripened.

Brown Turkey Figs came from Mr. Busby, gr. to J. Crawley, Esq.

Of Melons, Mr. Fleming sent fruit of the Trentham Hybrid, and Mr. Robertson, gr. to Lady Emily Foley, had a Hybrid Persian. Mr. Gray, gr. to W. Ricardo, Esq., sent the Queen Melon.

Miscellaneous Fruits consisted of a collection of Mandarin Oranges, in pots, from the Duke of Sutherland's garden at Trentham. These were nice little plants, each bearing 4 and 5 fruit. Mr. Lockyer, of Plymouth, produced specimens of Lemons grown in the open air; and some very large Cucumbers, called the Himalaya, came from Mr. Roser, gr. to J. Bradbury, Esq., of Streatham.

Mr. Iveson showed a ripe fruit of the Mangosteen from the Duke of Northumberland's garden at Syon, concerning which a full account will be found at p. 259, of a previous number.

Linnæan, *May 1st.*—The President in the Chair. F. Tagart, Esq., was elected a Fellow; and Professor Göppert, M. Hofmeister, and Dr. Planchon, Foreign Members. A memoir "On the White Secretion of Flata limbata, and its relation to the White Wax of China," by Dr. Murchison, communicated by Dr. Hooker, was read. In April, 1854, Dr. Murchison observed the leaves of certain trees and shrubs growing in the jungles in the neighbourhood of Rangoon to have a singular whitened appearance, which proved to be caused by numbers of insects bearing long white pectinated appendages of considerable length. On the slightest motion being communicated to the leaves, these insects sprung off in all directions, leaving, however, the white appendages behind. Dr. Murchison left Burmah without further opportunity of collecting and examining the insects, which appeared to be a little larger than a common house fly. The appendages which remained on the leaves after the flight of the insects were found to be adhering to a number of dried insect cases, each furnished with six legs, and evidently the remains of a former stage of the insect's existence. On examination it was found that this white matter coating the leaves possessed the properties of the insect wax of China. Acting on this suggestion, Dr. Murchison instituted a series of observations which led to the conclusion that the insect he had found, though probably not the same which yields the insect wax that has been imported from China, is yet one which, by some authors, has been described and figured as the true Chinese wax insect; and moreover, it was ascertained that it does yield, in considerable quantities, a substance of a waxy nature, which it seems probably may be employed for economic purposes. It would appear that one of the first notices in any English work of the Chinese wax insect is by Sir G. Staunton, in his account of Lord Macartney's embassy to China; and Sir G. Staunton's insect, the description of which coincides exactly with that found at Rangoon, is stated by Mr. Westwood (*Gard. Chron.*, July, 1853) to be the larva or pupa of the Flata limbata of Fabricius. In the Reports of the Juries of the Exhibition of 1851, the Chinese insect wax is stated to be the produce of the male Coccus ceriferus; but this insect has been shown by Dr. Anderson to yield the substance called white lac in Madras, which presents properties very different from the Chinese wax, being soluble in alcohol and ether, and of higher specific gravity than water. Mr. D. Hanbury has subsequently endeavoured to prove that the Chinese insect wax is the production of a species of Coccus, and not of the Flata limbata, his conclusions being drawn from specimens of the crude wax transmitted from Shanghai, as being employed for obtaining the wax of commerce. In this sample was a number of full-grown bodies of a female Coccus, as well as pieces of stick encrusted with wax, and with the insects still in *situ*. The insect Mr. Westwood had named Coccus sinensis, and subsequently (*Gard Chron.*, 1853,) Coccus Pela. There is every probability that the Coccus Pela contributes, at least, to the formation of the wax of commerce; but Dr. Murchison suggests that not improbably the wax from different parts of China may come from different insects. The Chinese wax of commerce is insoluble in water, and but very sparingly soluble in either alcohol or sulphuric ether, and it does not saponify with an alkali; its specific gravity is ·965, and its melting point has been variously estimated at from 181° to 186° F.; the melting point of common pure white wax being 155°, and its specific gravity ·963. The wax of the Coccus Pela purified was found by Mr. Hanbury to have its melting point at 182°·75 F.; its specific gravity has not been ascertained; it does not dissolve, or at least very sparingly, in alcohol, ether, or in solution of caustic alkali; but it dissolves readily, like the Chinese wax of commerce, in naphtha and fixed vegetable oils; and on cooling after melting indicates the same acicular crystalline structure. The characters of the white secretion of the Flata limbata coincided very closely with that of the substances just noticed; it had the same kind of acicular crystallisation in stellate masses; the melting point was not very accurately made out, owing to the minute quantity operated on, but it appeared to be between 190° and 200° Fahr.; it was insoluble in water, in which it floats, and but sparingly if at all soluble in alcohol, sulphuric ether, or solution of caustic potash, whilst in naphtha and vegetable oils it dissolves readily. From these characters there can be little doubt that the white secretion of the Flata limbata is of the nature of wax, and moreover that this waxy matter is very similar in its properties to the Chinese insect wax of commerce. It further appears probable that the Flata is a source of that substance. That it is not the only source seems proved by the facts adduced by Mr. Hanbury in favour of the Coccus Pela. Considering, indeed, that the annual produce of the insect wax is not far short of 400,000 lbs. per annum, and considering the very small quantity yielded by an individual insect, Dr. Murchison thinks it not improbable that the substance is derived from several species of insect, of which no doubt the Coccus Pela is one, and the Flata limbata another.

Notices of Books.

Loudon's Encyclopædia of Plants. A new edition, by Mrs. Loudon. 8vo., pp. 1574, with a multitude of woodcuts. Longmans.

The first edition of this celebrated work, which is incontestably of the greatest utility to gardeners, and, indeed, to all who have not access to great libraries, consisted of 1159 pages; the latest in our possession filled 1329 pages; that now brought before the public occupies no fewer than 1574, forming a solid, massive volume of small print, comparable to nothing so well as to a dictionary. The great recommendation of the work has always been its woodcuts; which, although only miniatures, were nevertheless drawn by Mr. Sowerby with such happy art, and so skilfully engraved by Branston, that the plants could always be recognised, even by those little acquainted with the vegetable kingdom. The continuation in the form of supplements is executed in a manner more than worthy of the original, and brings down the subject to the latest possible moment. The great feature of the work being thus worthily maintained, we are not inclined to criticise the letterpress, by Mr. George Don, which, as it will never be looked at by botanists, does not call for botanical censure. How many figures the work contains we are unable to ascertain, but we estimate the number of plants actually represented by good woodcuts as amounting to something more than *nine thousand!*

Griffiths' Posthumous Papers, Part IV. Dicotyledonous Plants, and a folio volume of plates. Calcutta.

Of this we have just received a copy by favour of the Court of Directors of the East India Company. We can only repeat our regret that the munificence of the Company should have not been met by a little knowledge and intelligence on the part of the Indian editor. Perhaps we ought to say that the present volumes are in some small degree less slovenly than the former ones. The wrapper informs us that the work, now we presume terminated, constitutes a complete system of Elimentary and Practical Botany, founded on the plants of India. We should say that it forms a memorable example of the possibility, by mere force of editorial negligence and incompetence, of rendering almost useless one of the richest mines of botanical knowledge which has ever been bequeathed to the world. One of the learned editor's latest discoveries is that Abies Brunoniana is a Taxus! (see vol. iv., plate 375). Unless Dr. Thomson can do something to correct such scientific (?) muddling we shall have the botanical student at Calcutta imitating Father Loureiro in calling a Hydrangea a Primrose.

Iconum Botanicarum Index, by George A. Pritzel. 4to., pp. 1184, in double columns. Williams and Norgate, and Pamplin.

This book contains references to eighty-six thousand representations of Phanerogamic plants and Ferns compiled from books published in the present and the last centuries. Although of necessity incomplete, it must be regarded as a marvel of patient industry applied to a most useful purpose; for the volume forms in fact a general index to the plates in any botanical library—no small convenience when we consider how formidable the number of illustrated books has now become.

Dr. Pritzel has avowedly neglected such works as Deakin's "Florigraphia," Jackson's "Pictorial Flora," &c., upon the ground that their "little pictures" have no relation to science, and in this he is perfectly right.

Red-tapeism: its Cause (Ridgway), is a pamphlet "by one behind the scenes." That this is a true description of the writer we entertain no doubt. He is evidently familiar with the secret processes of jobbery, and he exposes them. Among other points discussed in the pamphlet are the shameless dismissal of Mr. Kennedy for his immovable official rectitude, and the flagrant injustice towards Mr. Brown committed by the Treasury. Administrative reformers should study this pamphlet, which is not a tissue of idle declamation, but an able revelation of undeniable facts; and they will then learn why government work is always so inferior to that of private enterprise as one of the Treasury officers is constantly declaring, while he is at the same time doing everything in his power to ensure its inferiority. If government work is wretched it is because Government employs wretched tools, and dismisses those who resolutely set about getting better. That is all.

Garden Memoranda.

S. Rucker's, Esq., West Hill, Wandsworth.—The glass covered promenade, conservatories, and principal stoves at this place are now very gay, and the plants generally are in excellent condition. Camellias, here as elsewhere, have begun to make their young wood; but a few of them nevertheless are still in bloom, and among the latter Duchess of Northumberland was especially remarkable. This has white flowers striped with pink, and of excellent shape. Intermixed with the Camellias were Azaleas in full blossom, and the front shelf was occupied with Roses, Cinerarias, Azaleas, in the form of low flat-headed standards covered with flowers, a handsome variety of Amaryllis vittata called imperialis, an importation from Berlin; Rhododendron campanulatum superbum, a beautiful large white sort spotted in the upper petals with purple; Pelargonium "Parson's Perfection," a showy pink kind, and an excellent forcer; and other showy plants. On a back shelf, where they were partially shaded, were some interesting Ferns, among which we remarked Gleichenia microphylla, Hymenophyllum dilatatum, Trichomanes reniforme, the New Zealand Davallia, Mertensia flabellata, Todea pellucida, and a few pretty little plants of Lycopods. In the stove or warm department of this house Pentas rosea was in bloom; it has more colour, and is altogether a better plant than P. carnea, and it is equally useful. In addition to Orchids and other plants in flower here were some good Gloxinias, the most remarkable of which were Prince de Ligne, perhaps the very best of red kinds; grandis, a white variety blotched with red; and Victoria Regina, white with a blue blotch. Bouvardia longiflora, a species with snow-white flowers, was likewise in full beauty here, as were the showy orange scarlet Begonia Prestoniensis and other useful plants.

Many of the Orchids in the different houses, nay, most of them, are magnificent specimens, and several of them are at present finely in flower. Among the latter were beautiful varieties of Cattleya Mossiæ; also uniflora and intermedia, Dendrobium nobile, Farmeri, albo-sanguineum, and others; the scarce Odontoglossum Pescatorei, in the shape of a small plant purchased the other day at Mr. Linden's sale for 10*l.*; Lælia cinnabarina; Vanda suavis, a capital plant; Phalænopsis, quite masses of snowy white flowers; Chysis bractescens, and many others. A magnificent plant of Cattleya Skinneri has just gone out of bloom. This had been apparently literally covered with flowers.

In the aquarium the leaves of the different kinds of smaller growing Lilies (Nymphæas) are now nearly covering the surface of the water. The Pitcher plants placed round the tank have been cut "hard in;" but they are beginning to push strongly again, and some young plants of Nepenthes in another house are also in a most thriving condition, N. sanguinea, a small plant from a cutting a year ago, having now on it four large pitchers extremely well coloured. In this house the different kinds of Variegated Orchids were also in excellent condition.

The fruit garden here is quite a model of its kind. The trees are all in the form of pyramids, about 6 feet high. Bush fruit is also trained in the same way. Pears, Apples, Plums, and Cherries stand 8 feet apart between the rows and 6 feet asunder in the row, and alternating with them on each side of the beds are rows of Gooseberry and Currant trees, 15 inches from the alleys. The Cherries are in a compartment by themselves, and are netted all over; notwithstanding this, however, the frost has killed a great deal of the blossom and embryo fruit on the upper sides of the branches, but those on the under sides have mostly escaped; sufficient may therefore yet be left for a crop. Pears at present are a sheet of blossom, but Apples are not yet expanded; and, on the whole, there is here still promise of fair crops of most things.

Deodars and other plants on the lawn, which we may mention is in excellent order, have suffered comparatively little or nothing from frost, but we remarked some famous specimens of Sweet Bays in tubs browned by it, although stated to have been protected with canvas.

FLORICULTURE.

Culture of the Dahlia for Exhibition.—The following concise rules, to be observed in the successful culture of the Dahlia for exhibition, are not furnished so much for any novelty which exists in the practice recommended, as to point out a few of the most essential things to be done at the proper time. For economy in carriage, the plants are grown and sent out in small

pots; therefore, on receiving them from the nursery, place them in a close frame for a day and a night to recover them from their confinement; then repot them into 4-inch pots, using rich soil: the pots should be drained with coarse partly decomposed leaf-mould, so that in planting out there will be nothing to abstract from the ball of earth. A good start is of great importance; therefore care should be taken that the plant is grown to a fair size without drawing during the time it is in the pot; the stouter it is the better, without being tall; and it should not be pot-bound at the time of planting out: both the roots and the point of the plant should be in a thriving condition, and free from aphides. It may perhaps be unnecessary to state that the plants must be carefully hardened off before they are turned out. If the soil and plants are in a proper state, the first week in June will be a good time for the general planting, which, with ordinary care and attention, will produce good blooms in time for the earliest exhibition. A short period will suffice to have plants of a good size; but it should be borne in mind that hours lost in repotting them when in a young state will make a difference of days in the time of blooming, and it is important that this should be clearly understood, that no neglect in the matter may be permitted to take place. Examine the plants often to see if any require water; by no means let them become dry so long as they are in pots. Secure them with proper and strong fastenings at the time of planting; water whenever they require it, and sprinkle the foliage slightly almost every evening with soft water. Tie out the branches, and, as the plant increases in size, secure the side-shoots firmly to extra stakes. Cut away all superfluous small shoots. Some varieties have scarcely any to remove, while others have a considerable number. Fearless is of the class which has but few shoots requiring the use of the knife; but such kinds as Shylock require it freely. Indiscriminate pruning must therefore be avoided. Study the habit of the plant, and consider if the flower will be improved by increased size; all varieties need some thinning and disbudding, which should be effected at different periods. Small flowers require it as soon as the young shoots and buds can be removed, while large flowers, such as the Thames Bank Hero, Princess Louisa, and many others, would be rendered coarse and valueless for the purposes of exhibition if a number of buds was not permitted to remain till the plant was coming into bloom. Size in this case would be gained at the expense of quality; besides, there is the advantage of having three blooms where two would be grown. On the other hand, size, in moderation, must not be lost sight of. It was not with small blooms that I have taken first prizes for these last 15 years. I would therefore advise the young grower to avoid the two extremes. In shading blooms for exhibition, as a general rule, they should be one-third blown before they are put under the shade; and take care to secure such as appear to be coming good, and at the time they are required, from injury by friction. Slugs and earwigs are very destructive, and must be perseveringly kept down from the time the plants are put out till the end of the season. If you should be annoyed by a small black insect (which is often the case in July), use every means to encourage the plants to make rapid growths, by watering and syringing them overhead, and by brushing the depredators from the points of the shoots. Snuff, tobacco-water, and various other remedies are often resorted to; but these, if effectual in killing the pests, generally destroy the points of the shoots: if the plants are in a thriving condition, they will soon recover themselves. If the season proves dry, water freely two or three times a week; but never let it be done by driblets: give a good soaking when you do water, if that should not be so often. Employ manure-water once a week as soon as they begin to throw up their buds; but it should be used in a weak state at the commencement. Before concluding these remarks, permit me to bear witness to the increasing interest taken both in the culture of the Dahlia for competition and in the raising of seedlings. The enjoyment and pleasing recreation attending the cultivation of Florists' flowers add numbers to the fancy; and I have much satisfaction in stating that no flower is more generous in repaying the enthusiastic florist for his labour than the Dahlia. *T.*

Miscellaneous.

Sale of Orchids.—The Cattleyas from Brazil alluded to in our last week's Number, p. 316, realised the following prices: viz., C. Leopoldi, from 1*l.* to 5*l.*; C. violacea, 4*l.* 10*s.*; a Cattleya, supposed to be labiata, from 3*l.* 5*s.* to 6*l.* 10*s.*; a supposed new Cattleya or Lælia, 3*l.*; C. intermedia, a large plant, 7*l.*; smaller examples of the same, 2*l.* 8*s.*; other lots, of which there were in all 184, fetched from 1*l.* to 3*l.* per lot.

The Park at Edinburgh.—We understand that the design for this place, sent in by Mr. M'Ewen, gr. to his Grace the Duke of Norfolk, at Arundel, has been pronounced second among 38 competitors, and has been awarded a prize of 25*l.* We take for granted that the design selected is the best, but we can say from an inspection of Mr. M'Ewen's that whatever the merit of his rival, his would also have produced a very fine effect and did much credit to his taste.

Vegetation of Java.—I made a trip into the mountains, remaining nearly a week at Ivegoe, about 4000 feet above the sea. I think, had you been with me, you would have almost gone crazy, as I did, at the Cryptogams; every tree, from leaf to branch, was covered with Mosses, Hepaticæ, and Lichens, to say nothing of Orchids and Ferns; no words can express the beauty of the jungle. The most productive places, however, I found to be the old Coffee plantations, where the scrubby crooked trees were almost borne to the ground by the weight of the parasites; here a great epiphytal Ficus or Fagræa mounted on high, far thicker and stronger than its supporter; and there a perfect blaze of scarlet Æschynanthus, streaming down from the huge matted tufts of Asplenium or Acrostichum, ship loads of Vanda speciosa and odoratissima, Saccolabia, Dendrobia, Ephippia, any one of which would have carried off all the prizes at Chiswick, and sent all the gardeners into fits; and in every damp hollow groves of Dicksonias, Alsophilæ, and Marattiæ, some rising 40 or 50 feet, whose marvellous elegance and beauty, when swept by the wind, neither pen nor pencil can tell. Aroideæ are in great force, and of very various forms, as are also parasitical Rhododendra, Thibaudiæ, and such plants Melastomaceæ are very prevalent here, especially the genus Medinilla; most of them are semi-parasitic trailing plants, and hang in great masses from the trunks of the trees. But the Mosses and the Hepaticæ enticed me most, for these I could collect; while it was impossible, in my hurried trip, to dry other plants. Some of the pendent Hepaticæ and Neckeræ are a foot or more long, and the effect of large masses of them is most beautiful, especially intermixed as they are with long bunches of a white Usnea, like U. florida. I believe I have collected about 200 species of Hepaticæ, Musci, and Lichens, and the greater part of them in fruit. I shall be able, I think, to make 20 to 30 sets when I have time to open them; at present I have just dried and packed them up in a box, which it will be several months before I am able to attack. You shall receive some early specimens when I do get at them. The natives here are very capital intelligent fellows. I had three of them with me each day, with baskets, for which I paid one rupee, or about sixteen pence, and they seemed quite delighted. They soon found out what I wanted, and I owe many of the specimens in fruit to their sharp eyes. When I found a species barren, I just showed it them, and told them where I expected to find the fruit proceeding from, and they rarely failed to find it before long. They seemed, too, to identify themselves so with the matter, and showed such emulation as to who should be the first to find something new, that it was quite pleasant to be with them—I might have fancied myself among botanists. These mountaineers, however, are botanists to an extent you would hardly expect among so-called savages. Every plant has its native name, and given upon the system of generic and specific names. For instance, when I asked a man the name of a little Pavetta, he said at once, "I never saw this before, and I don't know its own name, but its 'mother name' is so and so," mentioning the native generic term for Pavetta Ixora and such plants in general. The authors of the catalogue of the Buitenzorg Garden have thought these names worth recording, and I think they are right; for I saw many plants I should not have seen, especially among the Ericeæ, but by asking for them by such names given in the catalogue; and it is wonderful, on looking these over, to find how well the system is carried out. It is of course imperfect, but remarkable for people with no written language. *Motley, in Hooker's Journal of Botany.*

Enemies to Fish in Fresh-water Aquaria.—Care should be taken in the aquarium for fresh water to exclude the ordinary Polype or Hydra fusca, particularly where certain species of fish are to be preserved, as with the minnow (Leuciscus Phoxinus), for these creatures, insignificant as they may appear, after a short time cause their death, and that under most extraordinary circumstances, as the following observations will tend to show: In a small aquarium that had had gold fish kept in it for a length of time, but which had been removed into one of larger dimensions and more fully exposed to the light, an enormous number of the Hydra fusca were observed to have made their appearance very soon after this removal. Wishing therefore to ascertain if the appearance and rapid increase of these polypes had been prevented by the gold fish, the following experiments were made:—Fifteen individuals of the Hydra fusca were placed in the aquarium containing the gold fish, but they very soon disappeared, having I presume been devoured by the fish; a second 15 were then introduced, but with the same result. At the same time as this experiment was made 15 hydras were placed in a tank containing four minnows (Leuciscus Phoxinus) and a pair of small eels, but as the minnows did not appear to touch them, the same number of polypes being counted over several times during a period of three weeks, they were soon forgotten altogether. After a space of about seven months had elapsed from this time, the minnows were observed to assume a most extraordinary aspect, the head appeared very much swollen, and the eyes of all of them looked as though starting out of their heads, being forced upwards and in an outward direction and much enlarged; by degrees the gills of some of them became streaked with bloody markings, and this gradually extended to the base of the pectoral fins. The whole appearance was most distressing to contemplate, particularly as it was impossible from ignorance of the cause, to adopt any remedial measures. Judging from their appearance my impression was that they had been poisoned, and assuming that it must have arisen from something putrescent which they might have raked out of the materials at the bottom of the aquarium, the whole of the water was drawn off clear by a syphon, the gravel and sand thoroughly washed, and everything replaced in the tank with the fish: no improvement, however, appeared to follow, the fish got worse and ultimately died. This was in June, 1853. Before this extraordinary change came on, the fish had been observed to cluster together in one particular secluded spot, and rarely came out as they had been accustomed to do, and when they did venture forth they rubbed or jerked themselves with much force against the gravel and rockwork, as though something was irritating the skin; nothing, however, was visible. I had had these fish for about 18 months in the same aquarium. As the water was perfectly bright and clear, and free from all odour or unpleasant taste, I procured six fresh minnows and placed them in the tank; for about 10 days, they appeared to be pretty healthy; they did not, however, swim about freely, but herded together in one corner of the aquarium, and then the same extraordinary change gradually came on which had been observed in the others, and after lingering for 17 days they all died. On carefully scrutinising the different parts of the tank with a magnifying-glass, my attention was at once arrested by observing the enormous numbers of the Hydra fusca which were present, particularly on the parts of the aquarium where the fish had been accustomed to feed; that is, along the water line towards the light, at the base of the plants of Vallisneria spiralis, about half an inch above the gravel, and on the whole of the rock-work around the space where the minnows delighted to hide; here they might have been seen stretching out from the sides, hanging down from the top—in fact, in every possible direction; here, then, was a solution of all the evil. It now became a question how these pests were to be eradicated, and, after canvassing in my mind a variety of suggestions, I determined to endeavour to remove them individually, and by this means they were speedily got rid of; from 50 to 100 being taken out daily. The method by which this operation was effected was as follows:—A long glass capillary tube open at both ends was introduced into the water, having the finger kept tightly over the upper orifice, while, with the edge of the lower opening, the polype was detached from its hold; the moment this was effected and the hydra began slowly to fall through the water, the finger was removed, and the water with the polype was thus rapidly driven into the tube by the pressure of the external column of water; on replacing the finger the contained water and polype were removed. By persevering in this course they were caught with the greatest rapidity, and dropped into another vessel before they had time to attach themselves to the interior of the tube, falling through the water like a miniature parachute. When situated in places where this mode of capture could not be employed, as on the leaves of the Vallisneria, or on the under sides of the rock-work, they were pulled off with a jerk by means of a small pair of forceps. In this manner between 400 and 500 polypes were removed from a small aquarium holding about 6 gallons of water. Since this some small carp and also minnows have been placed in the same water, and have continued now for upwards of 16 months in perfect health. It is a curious problem as to the manner in which this destruction of life was brought about; my own impression is that the hydras seized on the minnows whenever their extended tentacula were touched by the swimming fish—stinging them, and causing a great degree of irritation; and that the polypes were torn from their position by the greater strength of the fish, and carried to their places of retreat, where, by consequence, the mischief was continually accumulating. A similar removal from one place to another of an analogous creature, the young of the Actinia, takes place in sea water, from their attaching themselves by their tentacula to some moving denizen, the hold being released very soon after they are forced from their original attachment. *Warington, in Annals of Natural History.*

Australian Cochineal.—The Cochineal is indigenous to the colony of New South Wales; it subsists upon the Mimosa or Wattle, appearing in the form of a blight and thriving best upon the young trees. There are four or five generations of the insect during the year, the first or spring crop (which is the finest) being full grown in the month of September or October, and the others following in succession through the summer and autumn, a few of the insects remaining in the sheltered spots on the trees through the winter sufficient to keep up the stock. After laying its eggs, the insect dies, and the young ones hatch and spread themselves over the tree forming a sort of white film or web over the body which protects, and attaches it to the tree, where it remains stationary, finally laying its eggs inside the web. From the time the eggs are hatched to the full growth of the insect is about seven or eight weeks. The enemy of the Cochineal is the ant, which attacks and devours it before half grown, stripping whole trees of the insect in a very short time. It is considered scarcely necessary to remark that the Cochineal flourishes best in dry weather. *Sydney Herald.*

Calendar of Operations.

(*For the ensuing week.*)

PLANT DEPARTMENT.

CONSERVATORY, &c.—Eriostemons and other New Holland plants should be carefully divested of all seed pods as soon as their beauty for the season is over, cutting back the shoots as much as may appear necessary to secure close compactly formed specimens. Most of these plants enjoy a moist atmosphere while starting into growth, and as this cannot be commanded while drying easterly winds prevail, except by keeping the house

rather close, the plants should be placed in a part of the greenhouse where they can be guarded from cold drying currents, keeping the atmosphere moist by frequently sprinkling every available surface about them and shutting up rather early in the afternoon. Give air freely, however, on mild days, for keeping too warm would cause the plants to break scantily, and this must be avoided if well furnished specimens are to be obtained. Look well to the stock of plants for summer and autumn decoration, and do not allow them to sustain any check for the want of pot room or careless watering, from which under-potted plants often suffer at this season. The Croweas are first-rate subjects for this purpose—lasting longer in beauty than almost any other hard-wooded plant which we possess, and are deserving of being more generally grown than they are. Fuchsias for late blooming must not be allowed to become pot-bound, as any check at this season would throw them into bloom; and they should be afforded a rather cool, moist, shady situation. Stove.—The plants here will now be growing very freely, and will require frequent attention in the way of stopping, training, &c., and every effort should be used to properly direct the growth, for time lost now will not be easily made up. Do not let anything suffer for the want of pot room, and see that insects are kept thoroughly under. Also attend to maintaining perfect cleanliness about the house generally, washing pots, floors, &c., as often as may be necessary to secure a fresh clean appearance, and this will greatly assist in preventing the spread of insects, &c. Twiners, unless frequently looked to at this season, soon get so entwined that it is almost impossible without considerable loss of time and risk of injuring the tender points, &c., to disentangle them, but many of this class of plants bloom much more freely when their shoots are allowed to ramble in a somewhat natural manner until the blooms are fairly set, and this should be attended to in the case of such things as Echites, Stephanotis, &c., allowing them considerable liberty, without letting the shoots entwine about everything within their reach. Allamandas should never be tied into form until they are fairly set for blooming, for we have seen large healthy masses of these, which, instead of being covered with flower, only produced a few stray blooms in course of the season, and from no other apparent cause than the shoots having been always kept closely tied in, and twisted about the trellis. Have a supply of weak clear manure-water at hand, and give a liberal allowance of this to Clerodendrons and other fine foliaged free blooming plants, but do not apply it where there is any chance of its inducing a gross habit at the expense of bloom. Give air freely on mild bright days, but do not admit cold dry east winds too freely, also expose the plants to sunshine as freely as may be found consistent with maintaining a properly moist atmosphere. Shut up early on the afternoons of bright days in order to economise fire heat as much as possible, giving the plants a gentle syringing and sprinkling every available surface so as to saturate the atmosphere with moisture. Orchids.—Those in free growth should be afforded a thoroughly moist atmosphere, giving them a good steaming every bright afternoon by shutting up early, syringing the plants lightly over-head, and sprinkling the passages, walls, and every available surface. Examine the plants individually frequently, watering such as require it, and immersing those in baskets or on blocks in tepid water, when they cannot conveniently be kept sufficiently moist by the syringe. Take care however not to let water lodge too long in the axils of the young tender leaves, as this would probably induce decay. Look sharply after insects of all kinds, and keep these under at any expense of time and attention. Give air rather freely when the weather is favourable, but carefully avoid cold drying currents. Plants in bloom should either be removed to a colder and dryer house, or if they must be kept in the Orchid-house, place them together at the coolest end in order to prolong their beauty, and they should be allowed to remain here until their young shoots begin to make their appearance.

FORCING DEPARTMENT.

Pineries.—Plants swelling their fruit should be divested of all suckers, except as many as may be wanted for stock, directly they make their appearance. This will throw more of the energies of the plant into the fruit, and will also secure stronger suckers than if too many were left. Our more valuable sorts of Pines are not, however, very apt to produce any excess of suckers, but some varieties of Queen still in cultivation produce so many that the fruit never attains any size unless the suckers are thinned early. Guard against any decline of the bottom-heat, and where this is obtained from fermenting materials, a little fresh tan should be added before the heat gets too low; and it will be much safer to add a few inches occasionally as it may be wanted than to follow the old practice of renewing the bed only once or twice in the year. See to keeping the soil about the roots, where the plants are in pots or planted in the open bed in a nice healthy state as to moisture, and give manure-water regularly to fruiters and stock in free growth. Vineries.—Go over the Vines in succession houses, frequently removing laterals, &c., before they shade or interfere with the principal foliage. Where plants must be grown under the Vines the latter should be kept sufficiently thin to allow of a moderate share of light reaching the plants, and neither laterals nor any useless wood should be allowed to obstruct the light. See that none of the plants are infested with red spider or black thrips, especially the latter, which if once allowed to get upon the Vines is very difficult to eradicate, and is most destructive to the foliage. Azaleas are very subject to this pest, and if these are grown under the Vines they must be closely watched, and kept clean at any expense. And see that the Vines in the late house are tied up in their places before the shoots get too far advanced, as there is considerable danger of breaking these off when they are allowed to get too long before the rods are tied up. Look sharply after red spider, and use every means to keep clear of this pest. Figs.—Attend to stopping and thinning the shoots, and aim at securing short-jointed strong growth, by exposing the young wood to all the light possible. This will, of course, necessitate keeping the trees rather thin, but it is useless hoping for a crop of good fruit from trees that are crowded with wood. Keep the atmosphere moist, and give the foliage a good washing with the syringe after shutting up the house in the afternoon, to prevent red spider, and also see that the roots are kept properly moist. Where the fruit is ripening, syringing must, of course, be dispensed with, and the atmosphere kept drier, therefore be careful to have the foliage perfectly clear of insects up to the time the fruit begins to ripen. Melons.—Maintain a rather close, moist, warm temperature to plants recently planted out until they get into full growth, but avoid inducing a gross habit of growth by too much moisture and warmth after the roots fairly get hold of the soil, for it is generally somewhat difficult to secure a crop from wood of this sort. Give air as freely as the state of the weather will admit, in order to secure firm short-jointed wood, and where the crop is setting, as the young fruit is very apt to damp off unless the atmosphere is kept moderately dry. Endeavour to secure a steady bottom-heat of about 80° or 85° for plants in all stages, and also to keep the soil in a proper state as to moisture; avoid having to water while the crop is setting, by well soaking the soil before the principal blossoms begin to expand. Keep a careful look out for insects, and use every precaution to prevent these getting established upon the foliage, for there is hardly any chance of a crop of fruit unless the foliage can be preserved in health.

FLOWER GARDEN AND SHRUBBERIES.

So long as drying winds continue recently transplanted shrubs and trees must be carefully attended to with water. It is frequently the case, however, on heavy badly drained soils, that water is given to such things to such an extent as to sour the soil and render it uncongenial to the young rootlets and the after growth of the plants, and this should be avoided. The soil should be kept constantly moist, but not over saturated, mulching the surface with the mowings of the lawn to prevent too rapid evaporation, and large plants which appear to be suffering should be sprinkled overhead with the engine on the evenings of fine days, which will be of vastly more service in repairing the loss sustained by evaporation than excessive watering at the root while there is a deficiency of active rootlets. If the planting of any tender Roses still remains to be done this should be seen to immediately, taking care to have the soil made deep and very rich, which is the great point towards obtaining a fine display of blooms in autumn. Keep a sharp look out for the grub, and do not allow this pest to destroy the plants; and if green-fly makes its appearance on the young shoots syringe the affected plants lightly with a mixture of tobacco-water and soap-suds, and give the plants a good washing with the engine next morning. See that shrubbery borders, &c., are cleared of weeds, decayed leaves, &c., and rendered neat while the weather is so favourable for such work. The weather is still anything but tempting for commencing bedding out, for the wind is northerly, and a keen frost is a likely enough occurrence any night. But as the season is so far advanced it is to be hoped that we may experience a favourable change, and be proceeding with the planting out of all properly prepared stock under favourable auspices before the appearance of next Calendar. Meantime we would recommend keeping the plants under shelter until the weather becomes warmer, giving them every attention to watering, &c., so as to prevent their sustaining any serious check; for planting out the general order of bedding plants in the present state of the weather would be to run a considerable risk, and this without any decided advantage in prospect, for in the present state of the weather no amount of attention will induce such things to make any progress.

HARDY FRUIT AND KITCHEN GARDEN.

Look keenly after insects on Peach and Nectarine trees, and destroy them immediately they are perceived, so as to afford the young shoots a fair chance of making healthy growth early in the season, and depend upon it that there is little chance of getting the wood well ripened in autumn, save in very favourable localities, unless this is attended to. Also look after the Gooseberry caterpillar, and do not allow the foliage to be injured before adopting means to eradicate it. Perhaps the readiest way of destroying this pest is to give the trees a good washing with a powerful engine, directing the water against the under sides of the leaves as much as possible, which will wash off the caterpillars, and they are then easily destroyed on the ground by means of an iron rake. The little red grub which is so destructive about some places to the young shoots of the Raspberries is more difficult to eradicate, as we know no means of destroying this pest save by searching carefully for it, catching and killing it, and this is tedious work at this busy season. Get trenches prepared for Cucumbers, and filled with stable manure and leaves, or any other materials which will ferment slowly, and afford a gentle heat to assist in starting the plants; and get the plants prepared for planting out by exposing them rather freely to light and air on every favourable opportunity. Attend to putting in succession crops of Peas, Beans, Turnips, Spinach, &c., and secure an unceasing supply of Lettuce and other salads by sowing frequently. Where ground can be spared, and labour is scarce, Lettuce should be sown at this season where they are to stand, sowing in lines about a foot apart, and thinning out the plants, when strong enough, to proper distances in the lines. This is some saving of labour, and avoids checking the plants by removal. Do not allow Cauliflower plants to suffer through dryness at the root, and an occasional soaking of manure water will be useful to these and Cabbage also. Use the hoe among growing crops, and get weeds destroyed wherever they make their appearance. Take advantage of the dry state of the ground to get manure wheeled upon quarters where it will soon be wanted, and see that there is a good supply being prepared for the Celery crop; for without plenty of old rich manure large crisp Celery can hardly be obtained. Directly the weather becomes more favourable get the spring-raised Cauliflowers and Lettuce planted out, if not yet done, selecting for them a sheltered situation and light rich soil. A few branches of evergreens stuck amongst such things after planting, so as to screen them from the sun, are a great protection, and prevent their being dried up until the roots get hold of the ground.

STATE OF THE WEATHER AT CHISWICK, NEAR LONDON,

For the week ending May 17, 1855, as observed at the Horticultural Gardens.

May.	Moon's Age.	Barometer. Max.	Barometer. Min.	Temperature. Of the Air. Max.	Temperature. Of the Air. Min.	Temperature. Of the Air. Mean	Temperature. Of the Earth. 1 foot deep.	Temperature. Of the Earth. 2 feet deep.	Wind.	Rain in inches.
Friday 11	24	29.624	29.366	59	34	46.5	51	49½	S.W.	0.20

Satur. 26	66.2	43.2	54.7	13	0.48	[illegible]

The highest temperature during the above period occurred on the 26th, 1847—therm. 89 deg.; and the lowest on the 25th, 1839—therm. 29 deg.

Notices to Correspondents.

Books: *L T F.* The new edition of the "Theory of Horticulture" is now ready, as you will see by an advertisement in another column.‡

Diseases: *N G.* Your Cucumber seed, for which we are much obliged, shall have a fair trial. It will be valuable should it prove free from disease, though it can scarcely be expected to prove a first-rate variety, considering the quarter from whence it was derived.—*J B.* Your Melons are affected with the disease to which you allude, which will give you a great deal of trouble, with little hope of combating it successfully. Is your soil too light? If so, try what effect a stiffer loam will have.—*J W.* The affection of which you send specimens on Aerides odoratum and Saccolabium Blumei has come under our notice before. The condition of the tissues is very curious, and will be illustrated in the course of our series of papers on "Vegetable Pathology." Unfortunately we are unable to tell you the cause, and consequently to suggest any probable remedy. *M. J. B.*

Evergreens: *J C.* Berberis aquifolium, Gaultheria Shallon, Hypericum calycinum, Vinca major, Cotoneaster microphylla, Savin, and any of the hardier Andromedas, Ledums, or Rhododendrons. The hybrids of the latter will in some cases stand any amount of cold. Plant them in September.

Insects: *J R.* Your Pear tree is badly infested with the usual scale Coccus Conchiformis. If the tree is a choice one, the branches should be scrubbed with a hard nail or tooth brush, or scraped with the nail. Soft soap and tobacco water may be applied when the young active nits appear. *W.*

Names of Plants: We have been so often obliged to reluctantly decline naming heaps of dried or other plants, that we venture to request our correspondents to recollect that we never have, or could have undertaken an unlimited duty of this kind. Young gardeners, to whom these remarks more especially apply, should bear in mind that, before applying to us for assistance, they should exhaust their other means of gaining information. We cannot save them the trouble of examining and thinking for themselves; nor would it be desirable if we could. All we can do is to *help* them—and that most willingly. It is only requested that, in future, not more than four plants may be sent us at one time.—*R B.* Tecoma capensis.—*T D.* Justicia picta.—*W C N.* Veratrum nigrum.—*W S.* Teucrium fruticans.—*E J R.* Eriobotrya japonica, the Loquat.—*G C.* We do not recollect the plant, but will examine it and inform you next week.—*J A.* Lælia purpurata.

Thatching: *A Constant Subscriber.* We should have thought that any thatcher would have suggested the propriety of an underlayer of straw or reeds, over which the Heather could be fastened down. If your thatchers have not brains enough to do this we are afraid your case is hopeless.

Twin Conifers: *P S R.* We will examine them at leisure and mention them next week.

Vine Leaves: *F P.* The small green excrescences on your leaves are induced by a damp atmosphere and imperfect ventilation. They do no harm.‡

Misc.: *J A.* We know of no better way of moistening the air of the room than by employing open evaporating pans.‡

*** As usual, many communications have been received too late, and others are unavoidably detained till the necessary inquiries can be made. We must also beg the indulgence of those numerous correspondents, the insertion of whose interesting contributions is still delayed.

PERUVIAN GUANO, Bolivian Guano, Superphosphate of Lime, Nitrate of Soda, Sugar Scum, and every description of Artificial Manures, Linseed Cakes, &c.
WM. INGLIS CARNE, 10, Mark Lane, London.

SUPERPHOSPHATE OF LIME AND GUANO.—Merchants, Dealers, and Large Consumers supplied with these valuable Manures of best quality on advantageous terms on application at the Coprolite Mill, Ravenborne Street, Greenwich.

FOR PUBLIC SALE, for Account of the Underwriters, on MONDAY, May 21st, at the New Corn Exchange Tavern, Mark Lane, at 2 o'clock precisely, by order of Messrs. ANTHONY GIBBS & SON, the Importers, 800 Tons (damaged) PERUVIAN GUANO.—J. A. RUCKER & BENCRAFT, Brokers, 20 Commercial Sale Rooms, Mincing Lane.

TURNIP SOWING.—The Undersigned beg to offer their valuable Supherphosphate of Lime (See "Royal Agricultural Society's Journal," Vol. VI., Part 2), Turnip Manure, and Nitro-phosphate or Blood Manure.
Also on sale, Guano, Nitrate of Soda, Gypsum, Bone-dust, Sulphuric Acid, Salt, and all other Manures of known value. Agents for the sale of Peat Charcoal.—Apply for Prices Current to MARK FOTHERGILL & Co., 204A, Upper Thames Street, London.

PATENT SANITARY SEWAGE COMPANY'S NITRO-PHOSPHATED CARBON OR BLOOD MANURE, 10l. per ton; delivered in London, bags included. Each ton contains 1350 lbs. Blood and 11 per cent. of Phosphate of Lime.—Agents throughout the country.
22 Lincoln's Inn Fields, London.

FOR THE PRICE CURRENT OF MANURES.
NITRO-PHOSPHATE AND AMMONIA PHOSPHATE, manufactured by HODGSON & SIMPSON, Wakefield, and MATTHEWS & Co., Driffield, 8l. per ton.

MANURES.—The following Manures are manufactured by HODGSON & SIMPSON, Calder Soap Works, Wakefield, and MATTHEWS & Co., Manufacturing Agricultural Chemists, Driffield. SIMPSON'S AMMONIA PHOSPHATE, a valuable Top-Dressing for Wheat, Barley, and Oats. SIMPSON'S NITRO-PHOSPHATE for Turnips, Potatoes, and all other bulbous root crops. N.B. Manures specially prepared for Grass and Flax. The above have been successfully tested for the last seven Years by the leading farmers in Yorkshire and Lincolnshire, and other counties, and were applied last season to a breadth of upwards of 15,000 acres of land with the most beneficial results to the crops. A List of Testimonials and other particulars will be forwarded by post on application.

THE FOLLOWING MANURES are manufactured at Mr. LAWES' Factory, Deptford Creek:—Turnip Manure, 7l. per ton; Superphosphate of Lime, 7l.; Sulphuric Acid and Coprolites, 6l.
Office, 69, King William Street, City, London.
N.B. Genuine Peruvian Guano, guaranteed to contain 16 per cent. of ammonia. Nitrate of Soda, Sulphate of Ammonia, and other Chemical Manures.

CORN MANURE FOR SPRING SOWING.
CONCENTRATED URATE FOR GRASS, RAPE, AND ALL ROOT CROPS.
SUPERPHOSPHATE OF LIME.
THE LONDON MANURE COMPANY continue to manufacture the above Manures, which have been used with so much success for the last 14 years.
The London Manure Company also supply PERUVIAN GUANO (direct from importers' warehouses), Nitrate of Soda, Sulphate of Ammonia, Fishery and other Salts, Bone Dust, and every artificial manure of known value. EDWARD PURSER, Sec.
Office—40, Bridge Street, Blackfriars.

SEWAGE CHARCOAL MANURE.—This highly fertilising Manure, which is Peat Charcoal completely saturated with London Sewage, will be found most efficient for every species of crop; more especially for Peas, Beans, Turnips, Mangold Wurzel, and other root crops. It will produce a greater return for the outlay than Guano or any other Manure at an equivalent value: it also possesses the property of retaining its fertilising power longer than other Manures now in use. It may be obtained at the SEWAGE MANURE WORKS, Stanley Bridge, Fulham, at 4l. per ton, and in quantities less than half a ton, at 5s. per cwt., for ready money only; and in quantities not less than a ton, will be delivered at the London Termini of the Railroads free of charge for cartage. No charge for sacks.
It may also be had from Messrs. G. GIBBS & Co., 26, Down Street, Piccadilly, Agricultural Seedsmen, Agents for London, and from all the other Agents of the Company.

TO SELLERS OF FLAX SEED AND PURCHASERS OF FLAX STRAW.
MR. W. CALDECOTT, late of Frating Lodge, Colchester, and now Old Charlton, Kent, begs to inform struggling English Farmers that he, Mr. C., has at length fixed upon a site and machinery for the much wanted and talked of FLAX FACTORY, and is a buyer of any kind of Flax Straw at liberal prices, adjusted by length and strength; that now is the time for sowing this valuable crop in their clean fallows at two bushels per acre, so as to ensure a TURNIP CROP the same year; and that he is a seller of first-rate seed grown by himself (free from foreign Dodder and other rubbish), once from Riga, at 10s. per bushel, exclusive of sacks.—Apply early, as the quantity is limited.

THE LANDS IMPROVEMENT COMPANY, INCORPORATED BY SPECIAL ACT OF PARLIAMENT FOR ENGLAND AND SCOTLAND.—To Landowners, the Clergy, Solicitors, Surveyors, Estate Agents, &c.—Loans may be contracted for the execution by the proprietor or by the Company of every kind of improvement, especially Drainage, Building, Clearing, Fencing, Warping, Irrigation, Embanking, Reclamation, Roads, Fencing, Machinery, &c. The plans (of buildings), specifications, and estimates are prepared by the proprietors, and are submitted to the approval of the Enclosure Commissioners. Proprietors may avail themselves of the powers of the Act to recover from the inheritance their own funds to be expended on improvements. They may also apply jointly for the execution of a general improvement, such as a common outfall, &c. For forms of application, &c., apply to the Hon. WM. NAPIER, Managing Director, 2, Old Palace Yard, Westminster.

THE GENERAL LAND DRAINAGE AND IMPROVEMENT COMPANY
INCORPORATED BY SPECIAL ACT OF PARLIAMENT.
Offices, 52, Parliament Street, London.
DIRECTORS.
HENRY KER SEYMER, Esq., M.P., *Chairman.*
SIR JOHN V. SHELLEY, Bart., M.P., *Deputy-Chairman.*
George Thomas Clark, Esq.
John C. Cobbold, Esq., M.P.
Sir William Cubitt, F.R.S.
Henry Currie, Esq.
Thomas Edward Dicey, Esq.
William Fisher Hobbs, Esq.
Edward J. Hutchins, Esq., M.P.
Sir S. M. Peto, Bart.
William Tite, Esq., F.R.S.
William Wilshere, Esq.
Empowered to execute Drainage, Road-making, and other Land Improvements, and to Erect Farm Buildings upon Estates under Settlement, Mortgage, or otherwise; or Church property, and without investigation of Title to charge the whole outlay and expenses upon the Estate, to be repaid by instalments spread over any period determined by Landowners within the limits of 30 years for Drainage and Roads, and 31 years for Farm Buildings. Landowners may arrange with the Company for the execution of the works by their own agents, with the use of their own or Company's Capital.
WILLIAM CLIFFORD, Sec.

TO ARTIFICIAL AND CHEMICAL MANURE MANUFACTURERS AND MANUFACTURING CHEMISTS.
MR. COOKE, CHEMICAL ENGINEER & MANUFACTURING CHEMIST, contracts for the erection of Sulphuric Acid Chambers, and Chemical Plant generally on the most approved forms. Practical instructions from 12 years' experience in the trade given in the working of Acid Chambers, and in the manufacture of all kinds of Artificial Manures, Superphosphates, and Guanos. Receipts for the best mixtures furnished, and other information on application.—For terms, &c., apply by letter to 6, St. Thomas Terrace, Newcastle-on-Tyne.

SPOONER'S PATENT WATER AND MANURE DRILL.—Manufacturers: TASKER & FOWLE, Andover, Hants; and GARRETT & SONS, Saxmundham, Suffolk, to whom orders may be sent; or to the Inventor and Patentee, W. C. SPOONER, Eling, Southampton.

COLLEGE OF AGRICULTURE AND CHEMISTRY, AND OF PRACTICAL and GENERAL SCIENCE, 37 and 38, Lower Kennington Lane, Kennington, near London.
Principal—J. C. NESBIT, F.G.S., F.C.S., &c.
The system of studies pursued in the College comprises every branch requisite to prepare youth for the pursuits of Agriculture, Engineering, Mining, Manufactures, and the Arts; for the Naval and Military Services, and for the Universities.
Analyses and Assays of every description are promptly and accurately executed at the College. The terms and other particulars may be had on application to the Principal.

ARTIFICIAL MANURES, &c.—Manufacturers and others engaged in making ARTIFICIAL MANURES may obtain every necessary instruction for their economical and efficient preparation, by applying to J. C. NESBIT, F.G.S., &c., Principal of the Agricultural and Chemical College, Kennington, London. Analyses of Soils, Guanos, Superphosphates of Lime, Coprolites, &c., and Assays of Gold, Silver, and other Minerals, are executed with accuracy and dispatch.
Gentlemen desirous of receiving instructions in Chemical Analyses and Assaying, will find ample facility and accommodation at the College.

CHEMICAL ANALYSIS.
MR. H. MEDLOCK (formerly Chief Assistant in the Royal College of Chemistry) begs to inform Agriculturists that he undertakes the Analysis of Soils, Manures, &c., on moderate terms. Mr. Medlock also gives instruction to Gentlemen in Agricultural Chemistry at his private Laboratory, 20, Great Marlborough Street, London.

TESTIMONIAL TO J. B. LAWES, ESQ.—The Committee beg to inform those interested in the above undertaking, that the New Laboratory is expected to be ready for presentation in May or June, until which time the Subscription List will remain open, to afford an opportunity to any who may still wish to associate their names with this acknowledgment of Mr. Lawes' services.
Communications to be addressed to
Mr. W. KERL, Hon. Sec., Harpenden.

YORKSHIRE AGRICULTURAL SOCIETY.—PRIZE SHEETS for the MALTON MEETING may be had of the Secretary, Mr. JOHN HANNAM, Land Agent, Wetherby.

The Agricultural Gazette.

SATURDAY, MAY 19, 1855.

MEETINGS FOR THE ENSUING WEEK.
TUESDAY, May 22—Agricultural Society of England.

THE fears and doubts of Paris and its numerous visitors were finally dispelled on Tuesday last (the 15th) by the opening of the Exposition Universelle, which took place with all the forms and ceremonies proper on such occasions. These will be found duly recorded in another part of this Journal; our remarks must be limited to the points which more directly concern the interests of those engaged in agricultural pursuits. The interest which was excited by, and the commercial results which have followed, the Exhibition of 1851, have perhaps been as marked in reference to the agricultural Classes 3, 4, and 9, as in any others. We did well then, and received our reward: we now have to enter the lists with the same competitors, but on a foreign soil.

In the Paris Exposition the classification differs considerably from our own. We therefore think that a brief summary embracing all our agricultural relations with it may be serviceable both to those who intend to visit it and to those who are content to remain at home.

Class 2 comprises forestry, hunting, shooting, fishing, and the gathering of all produce obtained without cultivation. This is subdivided into eight sections:—1. General Statistics, Maps, &c.; 2 and 3. Vegetable Substances used in Arts and Manufactures; 4. Hunting and Shooting (capture of animals); 5. Fisheries; 6. Produce obtained without Cultivation; 7. Destruction of Vermin; 8. Acclimatisation of Plants and Animals. With this class happily we have not much that concerns us to any extent; in each section, however, we may find something to learn; and in none, perhaps, more than in that which relates to the management of woods and forests, still such an unsatisfactory page in our national ledger.

Class 3 is the representative of "productive industry," and comprises within the general term "agriculture" all that relates to the cultivation of plants and animals. Here we have seven sectional divisions:—1. Statistics and general documents; 2. Agricultural Engineering; 3. Implements and machines—fixed plant, &c.; 4. Crops cultivated for general purposes; 5. Crops cultivated for special purposes; 6. Breeding of animals (including poultry and insects) and their produce; 7. Industrial applications of agricultural produce. This class in its comprehensive range will no doubt contain much that will interest and much that will instruct; as yet, however, no indications of its existence are to be met with save in our own department, where the agricultural machinery begins to make a creditable show. Its location, however, is in the annexed building, which, although gradually emerging from the state of confusion which obtained for it the name of Balaklava, is still in a very backward condition.

Some anxiety appears to exist as to the opportunity that will be afforded for a general trial of the agricultural implements exhibited by different countries. The Imperial Agricultural Society, which usually holds a meeting for the trial of ploughs early in June, has this year notified that there will not be one, and the Great Agricultural Meeting (*Concours General Agricole*) to be held in the Champ de Mars from the 1st to the 9th of June, is confined solely to the exhibition of breeding animals, including cattle, sheep, and poultry, but not horses. This doubt, therefore, cannot be decided until the Jury meets, which commences its sittings on the 15th June, and will no doubt at once take into consideration the most suitable arrangements for a full and fair competition, without which no proper estimate of merits, intrinsic or comparative, can be arrived at. In regard to the Great Cattle Show, too, we believe less interest is excited and fewer entries will be made in this country than there would have been had its conditions been made known to us at an earlier date, and through the ordinary medium of communication with the agricultural community. For the first time our neighbours have invited us, and other stranger countries, to send over our cattle to compete for their liberal prizes.

The exhibition is to be divided into 2 sections; the 1st comprising animals *bred in foreign countries*, and belonging *either to foreigners or to natives*; the 2d, comprising animals *bred in France*. In the first section, which alone concerns us, the following prizes are offered:—

	Prize	£.		Prize	£.
CATTLE.—SHORT-HORNS—*Bulls*	1	40	*Cows*	1	28
" "	2	36	"	2	24
" "	3	32	"	3	20
" OTHER BREEDS—*Bulls*	1	40	*Cows*	1	28
" "	2	36	"	2	24
" "	3	32	"	3	20
" "	4	28	"	4	16
SHEEP.—LONG-WOOLS—*Rams*	1	24	3 *Ewes*	1	12
" "	2	20	"	2	11
" "	3	18	"	3	10
" "	4	16			
" SHORT-WOOLS—*Rams*	1	24	3 *Ewes*	1	12
" "	2	20	"	2	11
" "	3	18	"	3	10
" "	4	16			
PIGS.—LARGE BREED—*Boars*	1	12	*Sows*	1	8
" "	2	10	"	2	7
" "	3	8			
" SMALL BREEDS— "	1	12	"		8
" "	2	10	"		7
" "	3	8	"		6

In the four first classes, cattle and sheep, it is required that the males were born before the 1st May, 1854, and the females before the 1st November, 1853; the pigs must have been born before the 1st October, 1854. All entries are, according to the regulations, to be made before the 24th May; this, we are informed, will not be very rigidly interpreted in regard to English stock; but all must be on the ground on the 1st of June. All expenses attendant upon the transport of the animals from and to the Channel ports, and their charge while in Paris, will be borne by the Government; the exhibitors having only to provide the food.

At the termination of the Exhibition on the 8th, a sale will take place, when any animals not previously disposed of may be submitted to public competition.

This Exhibition, we think, offers great opportunities to our farmers for making known some of those breeds of cattle and sheep not generally imported into France, but which may be particularly suited for certain districts. Thus, new sources of demand might be opened up for our agricultural stock, which in a few years might rival in importance the demand which has increased so rapidly for our horses. The natural resources of France are great—her agricultural produce is comparatively small; this can be increased to an enormous extent if the country continues in its present tranquil state. Those who have watched the career of the present Ruler of France, and have seen the vast and important improvements that have been carried out under his Government in the different parts of the country, recognise his policy in now collecting in his capital the choice stock of foreign countries. He thus offers his people a means of comparison with their own and an opportunity of improving their native breeds by an admixture of foreign blood, or of substituting others for them that may present superior advantages. *W.*

DAIRY MANAGEMENT was made the subject of a lecture before the Royal Agricultural Society on Wednesday last, by Professor WAY. His remarks on the theory and practice of the butter and cheese manufactures will, no doubt, hereafter appear in full

detail in the pages of the Society's Journal for the benefit of its readers. A short report is given in another page.

The experience of dairymen is sufficiently various to make the discussion of their differences by a scientific man interesting and important. The weight of butter yielded by a given quantity of cream is a point on which very little agreement exists in published statements. In ordinary experience we do not hesitate to say 1 lb. of butter to a quart of cream is not throughout a herd of cows attainable, and Mr. Horsfall's yield of 25 ozs. to each quart is unprecedented—so much so, that few dairy farmers will believe it, except as a merely exceptional case.

They will not believe that 25 ozs. of well made butter, *i. e.*, with the milk well squeezed out, have been *generally* made from a quart of cream as ordinarily skimmed. Perhaps the best way of stating the result of any particular mode of feeding cows is to name the quantity of butter yielded by the *milk* produced. Mr. Horsfall states his ordinary produce at 25 ozs. from 16 quarts or 40 lbs., *i. e.*, 16 ozs. to less than 24 lbs. of milk. Mr. Telfer tells us that his produce at Cunning Park is 1 lb. from 22 or 23 lbs. when the yield is greatest, to 1 lb. from 30 to 32 lbs. when the yield is least. Mr. Horsfall's ordinary yield, provided there be no mistake, is just Mr. Telfer's extraordinary yield. Whether the experience of the former is attributable to the food he uses, or whether he has with sufficient care and over a long enough period of time determined his results before their publication we cannot say. The subject is no recent investigation of his, and we can therefore hardly suppose that any error fallen into would not have been found out before this; but the facts as stated by him are certainly remarkable, and deserve his closest scrutiny.

But Mr. Telfer's experience as to yield of butter differs from Mr. Horsfall's in other respects than this. His yield of pure butter from a given quantity of milk is larger in winter *without artificial heat* than it is in summer. The warmer milk yields a butter containing more cheesy matter, and heavier on that account; but a gain of 10 per cent. in quantity would be accompanied, he says, by a loss of more than 20 per cent. in quality.

The different statements and opinions given render the subject especially worthy of investigation, and we hope our correspondents will relate their experience on the subject.

The Agricultural Society of England does good service by the useful selection of subjects to which the attention of writers is directed by their prize list. And among them none more full of instructive matter has been named than that on the causes of fertility and of barrenness in soils, the prize for which has, we see, just been carried off by Mr. Coleman. Such a subject is, perhaps, too large for a single paper, as it necessarily occupies the greater portion of the whole agricultural field: but an enumeration of some of the topics which it embraces, with descriptive notices of such instances and illustrations as observation and experience may have furnished cannot fail to be instructive. Such an enumeration and catalogue of cases we shall now attempt to give. And in the first place let us name the limits within which the subject as enunciated confines us.

The words fertility and barrenness, as applied to soils, bear in this country almost universally a merely relative meaning. *Absolute* barrenness exists only on the uncovered rock. Wherever in our island there is soil it is more or less productive; for *that* we thank our climate. Its "fertility," however, is "barrenness" if it be so low as not to bear the expense of cultivation or of management. Between the Heath-bearing bog or moor, and the richest fields of Norfolk, Lincolnshire, or Lothians, there is a contrast certainly; and yet these cases are but different degrees upon a common scale; and the lowest of them are not at its zero, nor will any witness of our agricultural progress hitherto, believe that the highest instances as yet have reached its maximum extreme.

We propose to specify some of the causes of this varying fertility; some of the influences to which the thousand differing degrees of productiveness are owing that form the scale alluded to, which in this country extends between the barest vegetable covering, and the growth of food enough for 50 sheep per acre through the summer.

In the first place, then, what does "observation" teach about fertility and barrenness in soils? On the great scale it discovers and illustrates every grade of each. We have barrenness owing to inclement climate, and we have barrenness owing to a faulty soil—it may be too shallow, or it may be full of stagnant water—it may contain vegetable matter in excess—it may be too adhesive—it may be too light: every one of these causes may be seen in operation over large tracts of country. And we have fertility, as well, extensively exhibited, both as the result of natural conditions of soil and climate, and as the consequence of the energy and skill of the cultivator. Our rich alluvial lands, the meadows and the "marshes" of Somerset and Lincolnshire, and elsewhere, are among the best instances of the former; and there is not a county in the island but will illustrate the latter; and so we see how cultivation is creeping up the sides of the Mendips, and the Lammermuirs, and every other highland in the country; we see the boundary lines of all our moors and bogs and sandy wastes contracting; we see districts, such as Lincoln Heath and much of North and Western Norfolk, formerly rabbit warrens and poor infertile sands, now as productive probably as any others in the kingdom; we see fens, once the home of waterfowl, rivalling the richest specimens of natural fertility.

It is in the agricultural history of those years which divide the present from the past states of these tracts of land, that observation has recorded its best lessons on the causes of barrenness and fertility in soils; and it is along the boundary lines which separate these two conditions now, in districts where the process still remains unfinished, that these lessons can be read with greatest ease and force at present. If the student wish to learn how difficulties of climate may be met, let him visit Devonshire, or East Lothian, or almost any of the border counties of Scotland. Among the last-named he will see how Nature teaches on this subject; how, in the midst of a district suffering from this cause, there occur sometimes localities where she has provided an open subsoil and a freer soil, in which all the difficulties owing to inclemency of climate seem to disappear. And he will find that art has not only applied this lesson with success, but that by the aid of shelter furnished by the planter, as well as by the help of drainage and the selection of appropriate crops, cultivation is gradually extending upwards, successfully contending with climatic hindrances. If it be the treatment of a faulty soil that is the subject of inquiry, instances on every kind of scale may be found in every county of the kingdom. As for injury by stagnant water, we have lying before us a correspondence on that one subject relating to many thousands of acres in the whole, and distributed over nearly every county in England, besides many in Scotland and Wales; and the effects of land drainage are so striking, the injuries which it heals so great, that though all sorts of practices as to depth of drains and interval between the drains are given, while all sorts of soil as to cohesiveness and porousness are named, the answer to the question as to the nature of the result in almost every instance is "most satisfactory."

Then, as regards the improvement of the soil other than by draining, the student will find the practice of burning clays carried on in Gloucestershire and in Essex, and elsewhere; that of claying sands and peaty soils carried on, perhaps most largely, in Norfolk and in Lincolnshire; the addition of chalk to soils common in the practice of many of the eastern and southern counties of England; and the application of lime common everywhere. He will find many an instance everywhere of that greatest of all causes of increased fertility—the liberal application and economical management of manures; and to some of them we shall revert. He will find the opinion becoming pretty general that it is advantageous to deepen soils; and, while the use of the subsoil plough has probably diminished, he will observe in many districts (what the ameliorating influence of drainage has permitted) that ploughing and cultivation generally are becoming deeper—that portions of the subsoil are being mingled with the staple; and even that the digging-fork is being used as an implement of the farm. But fertility is not a condition merely of the soil; *that* is but its enabling cause: and the skill of the cultivator in producing it is shown, not merely in working the land, but in selecting those crops for growth upon it which, under his circumstances of soil and climate—of labour and of markets—shall yield him largest profit. And observation will perceive how, on the great scale, these circumstances have distributed the vegetable covering of Great Britain; how Grass affects the moister districts of the island, and arable farming is more prevalent on its eastern side; and how particular crops have located themselves on fitting soils, near fitting markets, Teazels being grown in the clothing districts of Gloucestershire and Somerset, Hops on rich lands near the capital. The student will indeed observe how this question of demand—this neighbourhood of markets—more and more becomes the sole determining cause of the character of the prevailing agriculture; how in every county there are instances where skilful cultivation having first arranged the fitting circumstances, the selection of the crop is dependant simply on the resolution of the cultivator.

We have supposed the student to examine many counties for these illustrations, but in truth he will rarely need to exceed the limits of the one in which he lives. In the county we are best acquainted with, and, doubtless, in most others, observation will discover illustrations of nearly every cause of fertility and barrenness in soils. It has deep alluvial lands, and sandy loams, in which we have traced the fibres of the Turnip 4 feet downwards; it has soils so shallow too, upon the mountain limestone and the millstone grit, that the pastures wither under a month of summer drought; it has among the stiffest clays and the lightest sands we know; it has highland and lowland sufficiently marked in their character to indicate the influence of climate; it has large tracts of pasture lands yielding dairy produce, and there are within it 100,000 acres in one district almost wholly arable; and as to the influence of manures upon fertility not only does it exhibit instances enough of ability and of indolence among its cultivators, but over its extensive dairy districts observation notices the significant fact that whatever be the geological formation—whatever the character and original quality of the soil—everywhere the *home-grounds* are the greenest in the winter months, and the most productive during summer.

So much for observation of the present merely, but we have known it many years; and the changes thus observed are even more instructive on the causes of fertility and barrenness. We have seen the drainage of the land and the removal of excessive hedgerow timber from it, the construction of good roads, and the erection of good buildings on it, prepare the way for better cultivation; so that from a poor Grass yielding from 15 to 18 cwts. of bad hay per acre, 30 tons of Mangold Wurzel, and even more of Drumhead Cabbages, along with alternate grain crops, have been substituted. All this is in one county; and we believe that few agricultural students, now-a-days, will need to look much farther, or even much beyond the limits of their own horizon for instances as striking of the illustrations which "observation" gives of this important subject.

IRRIGATION BY SUBMERSION, OR BY HOSE AND JET.

There have been animated discussions at the Society of Arts on a paper by Colonel Cotton "On the Public Works for India;" the points of controversy being on the sufficiency of the Company's projected works. The chief point of controversy between the colonel and the Company's engineers, was as to an alleged undue and exclusive preference given to railway over canal and river communication, which it was contended would be cheaper and more extensively available for India under its peculiar circumstances. At a second discussion held on Monday week, Edwin Chadwick Esq., C.B., in the chair, the irrigation works laid out by the Company's engineers were adverted to, when Mr. W. Bridges Adams, the engineer, observed that leaving the problematical question of navigable canals, we come to the question of irrigable canals. Of their value and permanent utility, if India is to make progress, there can be no doubt. Colonel Cotton cannot well over-rate them in this particular. In proportion as irrigation extends, population will thicken, and ultimately it will be found that the whole of the water can be advantageously absorbed to render the dry land fruitful. In hot countries the roots of the plants appear to be the best absorbents. Rain is not favourable to ripening vegetation. But the process of irrigating land by open channels is a costly one. Along the channels there is a thick and tangled growth of weeds, requiring a constant expenditure of labour to keep down. In the beautiful plain of Valencia, in Spain, the whole water of the river falls short of the necessities of the cultivators, and leaves much good land useless, and generates a perennial strife among the peasantry, which rises into an occasional tumult, with loss of life, and has to be put down by the soldiery. There is a proverb about the water:—

> "Una mitad al cielo,
> Otra mitad al suelo."

> "One half to heaven,
> The other half to earth."

Probably of all the water that springs from the mountain, one-third is absorbed by the sun, and another third by the porous channel, to grow weeds, while only one-third reaches the cultivated land.

In hot Spanish countries, with irrigation, it is customary to plant the acequias or irrigation channels with trees, to prevent evaporation. But there is yet wanting a cheap and efficient mode of conducting irrigation water under ground, and when that takes place it will be the most valuable gift that modern science can bestow on India, saving human labour, and preventing the waste of water. The water must be filtered before it enters the channels, to prevent deposit, and the channels must be easily accessible to clear out obstacles. If Colonel Cotton will set himself to work to solve this problem, he

will be a still greater benefactor to India than he has yet been.

The Chairman made some observations to show that this desideratum was practically accomplished by the method of surface distribution which he had got introduced into this country by the hose and jet, or by shedding by means of flexible pipes, with lateral apertures. Of the paramount importance of the proper execution of works for the adjustment of water supplies in India there could be no doubt. One speaker, whilst deprecating generalities in respect to the whole of that continent, had yet stated one general condition under which it was placed, of sudden and immense floods, of torrent-filled rivers, and of prolonged droughts, which certainly demanded works of extensive generality and magnitude for the collection and storage of these sudden falls, and for their regulated distribution. Such works had been commenced by the Company, but in important respects on erroneous principles. It appeared that the water-leading was by open cuttings, in the branches as well as the mains, and that the ultimate distribution was mostly by the method of submersion. Where the mains were not stagnant, and where they could be made to serve the purposes of traffic as well as of water distribution, the method of conveyance by open cuttings had, no doubt, compensating advantages; but in Peru, where the Spaniards raised enormous cereal crops by irrigation, it was a saying, that to lead water in open cuttings, was to lead it into the air; and it must be so, to a greater extent, in India. This appeared to have been formerly well understood. In Colonel Chesney's work might be found the native remains of ancient water-leading, by covered channels under the present arid and desert seats of former populations and civilisation. The method of ultimate distribution by the water meadow, old though it might be, was open to the fatal objection that it created marsh surfaces, and engendered marsh miasma. The chairman, in his sanitary researches in England, had found, and it was abundantly proved, as might be seen in the reports, that the water meadows generated the rot in sheep and the ague in men. His friend, Captain Baird Smith, in his able report on the Italian irrigations, had stated the fact, that from experience of the injurious effects of such irrigations, the formation of such works was in several states prohibited within six miles of towns; but it did not appear to have given to that fact its due and decisive weight. If such were the effects in European climates, it might be expected that they would be aggravated in the east by a more rapid decomposition under a more powerful sun; and so they were. Medical reports which the chairman had seen showed, particularly in the province of Agra, peculiar manifestations of the malarious influence in the enlargement of the spleen. The medical men reported that they could tell by the extent of enlargement of the spleen the extent to which the population had been exposed to the malarious influence. Now he (the chairman) had a large faith that unwholesome processes were not intended, and were not the best for the most economical or the most productive results. One effect of them was almost to necessitate with the inferior labour a depressed, inferior, and expensive population. In some consultations on drainage works for the productive and sanitary improvement of Guiana, he was not surprised to find the slave labour in reality dear, as well as inferior labour, and obstructive of improvement. He had been assured by a large planter that he could afford to give as much as 3*s.* per diem for labour as good as common day labour in England. Then, why not import it? The answer was, that it had been tried, but that the free labourers could not stand the climate, and would have recourse to rum, which destroyed their value as labourers. What was called "the climate" was, in the particular instance, the miasma from the stagnant ditches used to drain the land, and which so closely intersected it, that the plough which might there have been otherwise used could not run. In England he had promoted the use of covered but permeable tile drains in substitution of the open ditch drains, which commonly surrounded our towns as well as lands, and they were now proved to be the most economical; and to remove all sanitary objection, the late Dr. Shier agreed that in the particular instance they would have removed the barrier to the introduction of superior labour, as well as the obstructions to the working of the plough. It appeared that, in consequence of the irresistible evidence in India of the effect of the miasma from the irrigation by submersion, it had been provided that they should not be carried on within such distances as three miles from a town. If, however, six miles distance were required for the protection of the population of Italian towns, three miles was certainly too short a distance in India. He had evidence even in England that marsh effluvium had been perceptible for 15 miles. After a continued prevalence of wind from over the marshes and open ditch drains in Essex and Kent, at Plumstead, comparatively weak as was the power of decomposition here, scattered cases of marsh fever—known as such to medical officers conversant with the marsh diseases—and ague, were found to occur amongst the population to the very extremity of the metropolis. In some of the reports of the Company's officers, it was stated as conclusive and satisfactory, that from the provision made, "only a few" cases of enlarged spleen occurred amongst the adjacent population. To those who understood the subject, however, "the few" developed cases (which usually on examination turned out to be not a few), denoted the prevalence of wider deleterious influences than the particularly developed cases. But this supposed protection wholly disregarded those who were to labour in the artificially created marshy surfaces; it was in ignorance of that to which he must repeatedly call attention as a practical economical principle — that inferior processes, processes which were physically injurious and depressing, made inferior labourers and inferior populations. He was happy in being able to convey confident assurances that these unsanitary consequences were avoidable, and, moreover, were avoidable with a profit. From having been compelled to struggle with the difficulties of dealing with the refuse of towns, he had been led to propose, in substitution of the practice of applying liquid manure by the method of submersion, the principle of pipe distribution, or the application of liquified manure by pipes and hose and jet. This was now in course of increasing application in farms, and its sanitary success would be found to be everywhere demonstrated. As with applications by the horticulturist, or by the gardener's water-pot, no more was given at one time than the soil could at once absorb. Plants whose natural habit was not submersion in liquid were not subjected to it. There was no stagnant surface water and no decomposition. Even where liquified manure was applied, there was an immediate chemical combination with the soil, which it was proved retained it permanently, and there was no loss from decomposition, and no atmospheric pollutions from that cause. There was also a large economy of water. But what perhaps was of the most immediate importance, there was a large economy of original outlay, as well as in working expenses. Captain Baird Smith, in his report on the Italian irrigations, had shown that as much capital as 40*l.* per acre had been expended in the construction of the water meadows and the connected works. The average cost of the Wiltshire water meadows was about 16*l.* per acre. The Chairman held in his hand a tabular view of the comparative outlay and the working expenses of the works for distribution by submersion, and of those for distribution by jet. From this table it would be perceived, that the total cost of the works and apparatus of all the prominent examples examined of irrigation, by bed works and gutters, including the instance of catch-water meadows, had been 31*l.* 14*s.* 7*d.* per acre, and that the total annual charges and working expenses were 3*l.* 7*s.* 1*d.*; whilst the cost of the new works and apparatus on the average of all the examples of distribution by underground pipes had been 2*l.* 7*s.* 1*d.* per acre, and the annual charges and working expenses 8*s.* 11½*d.* per annum per acre. The cheapest instance found of the method of distribution by open gutters, the Pusey catch-water meadows, was 14*s.* 3*d.* per acre, whilst the total annual expenses of the cheapest method of distribution by closed channels and underground pipes, and by jet and hose, was 7*s.* 1½*d.* per acre. The detailed particulars of works from which every competent officer might judge for himself were to be found in the official minutes published on the subject, and one additional advantage would be seen in this, that the works did not confine the cultivation to one method, but were equally applicable to arable and to arboretal cultivations. From what had been stated of the cheap rate at which water was raised in India by simple means, there could be little doubt that the experience here as to economy of construction and working were applicable, *mutatis mutandis*, to India. It should be our mission to introduce into that country the most advanced improvements of modern civilisation, and our dominion should be based on the benefits rendered by it to the population. Care should be taken that in mere routine, and from poverty of resource in adaptation, we did not introduce European defects. This was of primary importance in relation to those works on which the productive powers of the country must mainly depend, namely, those for the adjustment of the supplies of water. At the same time the Company's service, military as well as civil, furnished some of the most brilliant examples of fertility of resource and administrative ability in the empire. It would have enlarged the sphere of their discussion, and presented an example worthy of high regard, as it appeared only imperfectly known in India and almost totally unknown in this country, if, from the papers officially printed by the Company, he might have presented to them in detail the example of the conquest, the reclamation, and the civilisation of the Mairwara, of which the foundation had been laid by Colonel Hall, of the Company's service, but the brilliant superstructure had been worked out by Lieut.-Colonel C. J. Dixon, of the Bengal Artillery, It was the case of a wide range of hilly district, badly cultivated, infested by wild beasts in jungles, and occupied by a robber population, whom it became necessary to subdue, for the protection of the inhabitants of the surrounding districts. Under ordinary routine, it would have been merely garrisoned at a great expense, but Colonel Dixon perceived that the failure of the crops from the irregular supplies of water at times necessitated predatory habits, to which the long intervals of labour from a rude and bad cultivation gave them leisure. To meet this condition Colonel Dixon projected works for the collection, storage, and distribution of water. He obtained government advances of money, and occupied the robber population in their construction. Subsidiary works were designed, money advanced, and the same population was engaged in the reclamation of jungles and in that steady and highly productive cultivation, of which the adjusted water supply and distribution afforded the means. The time of the population was so well occupied, that they had no leisure nor inducement to think of depredation. He succeeded in doing there what our administrators had not succeeded in doing here, in making absolutely condemned criminals prefer honest and productive industry. For the conveyance of produce, roads had to be made for the accommodation of the increased numbers of cultivators; villages had to be constructed; for the supply of the villages a town had to be created, and for the sale of the produce, markets and fairs to be instituted. The Government advances of capital were repaid with interest. Instead of levying black mail on the surrounding population, instead of occasioning the expenditure of a revenue, in maintaining the repressive action of troops, the district now furnished good subjects and good troops, and a good revenue for the maintenance of the local as well as the general government, from a thriving and increasing population. All this had been done in a very few years, and the instance might be cited in proof of the possibility, by similar administrative appliances, of altering completely the condition of that empire within the span of one generation.

The following is the table of the comparative cost and working of the two descriptions of works, as applied to the distribution of liquified manures:—

Name of Place.	No. of English acres.	Mode of Application.	Total cost of works & apparatus per acre.			Annual interest, &c., at 7½ per cent. per acre.			Annual working expenses per acre.			Total annual charges per English acre.			Observations.
			£	s.	d.	£	s.	d.	£	s.	d.	£	s.	d.	
NOTTINGHAMSHIRE. Duke of Portland's Clipstone Meadows	300	Catch-meadow, gravitation, and open gutters.....	120	0	0	9	0	0	0	10	0	9	10	0	Previously worth from 3*s.* to 5*s.* per acre, per annum, produce now upwards of 12*l.*
EDINBURGH. Craigentinny Meadows: High Level	63	Steam engine, pumps, and open gutters and panes...	31	14	11	2	7	7	1	17	4	4	4	11	Average rental, upwards of 16*l.* per English acre.
Sea Meadows	38	Gravitation, open gutters, and panes	18	8	5	1	7	7½	0	10	5½	1	18	1	Worthless 25 years ago, now worth 520*l.* pr English acre.
Old Meadows	228	Gravitation, open gutters, and panes	11	16	10	0	17	9	0	10	5½	1	8	2½	Maximum rental, 25*l.* per English acre.
WILTSHIRE. Wiley Meadows	150	Bed-work of ridge & furrow, gravitation & open gutters	20	0	0	1	10	0	0	7	0	1	17	0	Four heavy crops of Grass per annum.
DEVONSHIRE. Duke of Bedford's Tavistock Meadows	90	Bed-work & catch-meadow, gravitation & open gutters	13	2	10	0	19	8½	0	15	0	1	14	8½	Land more than quadrupled in value after only five years irrigation.
BERKSHIRE. Pusey Meadows	100	Catch-meadow, gravitation, and open gutters	4	9	0	0	6	8	0	7	7	0	14	3	Land not previously worth more than 5*s.* per acre, now yield 6 heavy crops of Grass per annum.
STAFFORDSHIRE. Duke of Sutherland's farm, near Trentham	83	Steam engine, pumps, underground iron pipes, gutta-percha hose, and jet pipe	6	5	5	0	9	5	0	4	4¾	0	13	9¾	Tanks constructed sufficient for 300 acres.
GLASGOW. Mr. Harvey's farm.....	508	Steam engine, pumps, underground iron main pipes, & iron distributing pipes	2	17	1	0	4	3½	0	9	5½	0	13	9	10 feet thick of Grass cut from an acre in 6 months.
GLAMORGANSHIRE. Porth Kerry Farm.....	50	Gravitation, iron pipes, and gutta-percha hose	6	0	0	0	9	0	0	4	0	0	13	0	Tanks constructed sufficient for 300 acres. Upwards of 9 feet of Grass grown.
AYRSHIRE. Mr. Kennedy's Myre Mill farm	508	Steam engine, pumps, underground iron mains, gutta-percha hose, and jet pipe	3	2	6	0	4	8¼	0	6	4¾	0	11	1	70 tons of Grass cut from an acre in 6 months.
Mr. Telfer's Cunning Park farm	50	Ditto	4	4	0	0	6	3½	0	4	4¾	0	10	8¼	14¼ feet thick of Grass cut in 7 months.
LANCASHIRE. Mr. R. Neilson's Halewood farm ...	120	Ditto	4	0	11	0	0	6¼	0	3	3¼	0	9	9¾	One dressing of liquid found equal to 25 to 30 tns. of solid farm-yard manure per acre.
CHESHIRE. Mr. Harrold Littledale's Liscard farm	150	Ditto	4	9	7	0	6	8½	0	2	4¼	0	9	1½	A 4th crop of Grass, equal to 10 tons per acre.
Marquis of Ailsa, Leg or Dunduff farm ...	50	Gravitation, underground iron mains, gutta-percha hose, and jet pipe	3	16	5	0	5	8¾	0	1	4¾	0	7	0¾	12 stacks per an. previously, 80 stacks last year.

The new model farm at Glasnevin, in Ireland, has been laid down on this principle, which has also been adopted by Lord Grey and Lord Kinnaird on farms which will be at work this year.

EXPERIENCES IN LAND DRAINAGE.

No. VIII.—The result of my experience has been generally satisfactory, except in some situations upon strong clay lands, where the drains are 30 feet apart, and which I think should not exceed 18 or 20 feet.—The system adopted has been chiefly parallel, except where the formation of the earth required them otherwise.—The prevailing depth has been 4 feet in all situations where draught could be obtained from that depth.—The only difference in our mode of draining between arable and grass land is that the furrows have been followed on the latter.—Where the ridges are high and of a great width, we have drained with the fall; and the furrows have been followed where they came within the proper distance for which the drains were set out.—Two-inch pipes have been used for minor, and 3 and 4, 5 and 6-inch for main drains; no collar or socket pipes have been used, as the drains are generally of a firm and strong nature.—Cannot speak with any degree of accuracy on the benefit of giving air at places either to main or minor drains.—The average number of acres discharging at the several outlets varies materially as to where outlets can be obtained, say from 2 to 10 acres, the main pipes being proportionately large.—The soil and subsoil is chiefly clay, with an admixture of stones and marl.—*Ryle, Moor House, Durham.*

No. IX.—The result of our drainage operations has been perfectly satisfactory, and generally approved by tenants who were much opposed to deep draining in the first instance.—I have adopted what is commonly called the parallel system.—The prevailing depth of the drains has been 4 feet.—No difference in our mode of draining between arable and grass land when under similar circumstances.—Minor drains taken with the fall in every instance. On strong land where ridges are high I have been compelled to keep to the furrows, urging tenants to level the ridges as soon afterwards as possible.—I have generally used 2-inch pipes for minor drains; and for mains, from 3 to 8 inches capacity, according to circumstances.—I have not used any socket pipes, and collars only where the land is unsound. I dare not lay pipes of a less size than 2 inches without collars.—I have seen instances where air has been required for insuring a rapid and even discharge of the water, but I have never found it necessary in my own practice; I have sometimes made a "well" in a long or important main drain for the sake of satisfaction more than from any existing necessity for air.—What is the average number of acres discharging at the several outlets? This question I cannot answer; I may say from 40 acres to 4. As a general rule I think the square root of the acres in a field will give the size of the outfall pipe required; thus for a 9 acre field 3 inch outfall, 16 acres, 4 inch; in practice I prefer, however, to exceed rather than to be under this rule in the size of an outfall pipe.—The soil and subsoil have been various; from clay of the strongest and most "impervious" quality to gravel.—The geological formation is various.—The draining I have effected being in various parts of the country and under different circumstances I cannot give a satisfactory answer to the questions about height of situation or rain-fall. *G. Beaumont, Bridgeford Hill.*

No X.—The result of our drainage operations on all descriptions of land has been satisfactory.—I have found that all drainage for spring water must be done according to the particular circumstances of the case, and my replies only refer to drainage for surface water on strong clay-land. The plan has been in some cases (where the land was in ridges of 4 and 4½ yards wide) to make a tile drain up every other furrow 2½ to 3 feet deep, taking care that none of the subsoil or clay should be put back into the drain, but spread over the land. As soon as practicable after the draining, say in three or four years, the lands or ridges are ploughed into proper form, the old alternate furrow without a tile-drain being now the ridge, not at all high, but with a gradual fall each way to the furrow. I have land before me which was treated in this manner in 1826, and in nearly every subsequent year, and the result continues to be quite satisfactory—growing 30 tons of Swede Turnips, 10 to 12 quarters Oats, 5 to 6 quarters Wheat, and 5 to 7 quarters of Barley per acre; this latter crop depending so much upon the state of the land when the Turnips were carted off. In March 1850 I drained a field up every furrow at three different depths—2 feet, 2½ feet, and 4 feet. It has grown Barley, seeds pastured two years, and Oats; now sown with Wheat. No person has yet been able to say which was drained 2 feet or 4 feet, and I am thoroughly convinced that where there are no springs, the soil strong, and the subsoil clay, 2½ to 3 feet is more beneficial than any greater depth. Nearly all the land, which since draining grows large crops of roots and of Barley first-rate malting quality, a few years ago grew miserable Turnips and Barley only fit for grinding, besides which the harvest is now as forward as on the hottest part of Sherwood Forest.—The prevailing depth of the drains is 2 to 3 feet.—The mode of draining on arable land is deeper than on Grass.—The direction of the minor drains is with the fall. I have followed the furrows where the land is in ridges generally. In some cases I have set out the drains 9 yards apart, without reference to the old furrows; but in every case I keep the land in very slightly elevated ridges, the tile being always under the furrow and this plan I find far preferable to having the land flat.—I have used 2½ inch pipes, and horse shoe tiles 3½ × 2½ inch for minor drains. The outfall tiles vary.—I have not tried giving air at places to either main or minor drains.—The average number of acres discharging at the several outlets has been 3 to 6 acres.—The soil and subsoil are loam on red and blue clay.—The geological formation is red marl, or red sandstone.—The mean height of the land drained above the sea level is 120 to 150 feet.—The average depth of rain-fall in our neighbourhood is 27½ inches. *Richard Milward, Thurgarton Priory, Southwell, Notts.*

No. XI.—The result of our drainage operations on all descriptions of land as regards work done in the last five years, and under my personal directions, has been satisfactory.—The drainage I have adopted has been a parallel system as a principle.—The prevailing depth of the drains has been 4 feet.—I have made no difference in the mode of draining between arable and Grass land, although I have doubts as to the advisability of so deep draining (4 feet) marsh land when the soil is light.—The direction of the minor drains has been with the fall; I think it an error to be governed by the furrows.—The pipes have been 1½ inch to 3 inches in minor drains, and 3 to 6 inches in mains; I have double piped through quicksands and bogs, but found little occasion for collars elsewhere.—I have found no benefit by giving air at places to either main or minor drains, and cannot see the use, seeing the soil is made porous by draining.—I would not willingly bring above 10 acres to one outlet.—I believe my experience must include nearly all the soils we have in England.—As to the mean height of the land drained above the sea level, I refer to no particular neighbourhood, as I have had to drain across the island. *Hewitt Davies, 3, Frederick's Place, Old Jewry, London.*

No. XII.—The drainage has been satisfactory except in some cases of peat. I have found all drains in peat containing red water to be choked by a sort of ferruginous deposit, in about four or five years. Chemists say lime will counteract this. I have not found it so; having limed a great portion of a drained bog at the rate of 200 bushels of clod lime per acre. The drains were choked exactly in the same manner as the unlimed portion. I have redrained the bog, giving a little more fall in the drains, with pipes 3 inches diameter, at 5½ feet deep, 40 yards apart; each drain being carried up the adjoining hill to gain a supply of pure water in order to dilute the deleterious water of the bog, and to flush the drains. At present the result is deemed satisfactory. Experience has taught me that drainage is effectually done in Grass lands where the subsoil is porous, at 40 yards apart, and 5 to 5½ feet deep; in any subsoil at 20 yards apart and 4½ feet deep, *i.e.*, in the furrows. Ridge and furrow should always be crossed in a slanting direction if possible, *i.e.*, consistent with true levels, in Grass land, unless the ridges are very high old-fashioned ridges.—Parallel drains have been used.—Four to 7 feet deep, 10 yards apart in tillage land, 20 yards apart in Grass land.—Half the number of drains is amply sufficient for Grass land.—Minor drains are laid on these levels (down the steepest part of the hill), so that the bottom of every drain is in the same uniform level as its neighbouring drains.—Pipes 2½ inches in diameter for minor drains; 3 to 9 inches in diameter for mains; collars used when really necessary.—If drainage is properly done there can be no need for giving air at particular places; water of drainage carries air with it.—From 5 to 40 acres run out at one outfall according to circumstances, it being deemed necessary to have as few drain mouths to look after as possible; also the greater the discharge of water from the main the more likely is the outlet to be kept clear.—Almost every description of soil has been drained.—The geological formation is blue mountain limestone, or lead measures.—The height above sea is from 550 to 750 feet.—The rain-fall is unknown. *J. Anderson, Newcastle.*

No. XIII.—The result of my draining operations on all kinds of soil has been satisfactory, excepting in some of the earlier works where the drains were not of sufficient depth.—I have invariably adopted a parallel system.—The prevailing depth may be stated at 4 feet 6 inches.—I have generally placed the drains a greater distance apart in Grass lands than in tillage lands.—The minor drains are placed in the line of the greatest fall, and in some instances where the ridges are much raised (particularly in Grass lands), they have been placed in the furrows.—I have used 2½-inch diameter cylindrical pipes for minor drains, and 4-inch and 6-inch pipes for mains.—I have never tried the effect of openings to admit air, but it strikes me that soil perfectly freed from water requires no such openings.—About 10 acres run out at one outfall.—My experience embraces every variety of soil and subsoil—clay, bog, loam, sand, &c. &c.—The same remarks will apply to the geological formation, but the greatest proportion of the works has been executed over the Northumberland coal formations.—The altitude of the lands drained ranges from 200 feet to 1000 feet above the level of the sea.—There are not (I am sorry to say) any rain-gauges kept in this district.—I may mention that I have directed and superintended an outlay in drainage very little short of if not exceeding 15,000*l.* About 3000*l.* of that amount was expended in 3-feet drains laid down at distances from 18 to 21 feet apart (which has not been quite satisfactory), and the remaining 12,000*l.* of a depth not less than 4 feet. I have had one or two failures in deep drainage, where from a desire to economise I had placed the minor drains at too great a distance apart, and where, from the negligence and ignorance of the farmer, the land had not been laid perfectly level. In very strong clays I place the ordinary drains about 24 feet apart and 4½ feet deep with perfect success; in medium subsoils about 33 feet apart and the same depth; and where the subsoil is very porous as far as 45 feet apart and 5 feet deep. And in some pasture lands I have placed the drains 50 and 60 feet apart with the greatest success. I now find that some of our earlier performances at a depth of 3 feet will require to be redrained at a greater depth. It is painful to see the shallow drainage still going on near Newcastle-on-Tyne and many parts of Scotland. *Thomas Gow, Newcastle.*

Home Correspondence.

The Nitrophosphate Manure.—In reply to "S. R. E." as one of the trustees of the "Nitrophosphate or Blood Manure" Company, I beg to state that last year I used 35 tons, and during the present season I am using [illegible] tons of that valuable manure. I used the nitrophosphate alone for my white and green round Turnip and Rape with great success, but with Swedes and Mangolds in admixture with farm-yard manure (in small quantity), guano, and salt. From the favourable reports of some neighbours as to its use on corn crops, I am this year using it on from 60 to 100 acres of Oats and spring Wheat. My occupation is upwards of 600 acres of light chalk soil, and 380 heavy clay. The nitrophosphate was equally successful on both soils. *H.* [We shall be happy to give our correspondent's address "S. R. E." wishes for further information.]

Temperature of Dairy.—In reply to the inquiries of "An Original Correspondent," the water used for increasing the temperature of my dairy is quite hot; when the tap is opened, the water travels through the cistern to the other extremity, where the outflow pipe is placed, throwing off a considerable quantity of steam. The supply of hot water is exhausted in six to eight minutes, and in about half an hour the water is cooled, and then wholly drawn off. By this application, the temperature of the dairy is increased to 60°. The bowls are of thick glazed earthenware of a dark brown colour. As earthenware is a slow conductor of heat, I think it improbable that the milk, of which there are 4 to 5 quarts in each bowl, attains a temperature equal to that in the dairy, as this begins to lower when the hot water has ceased to flow. The bowls stand on a base of 6 to 8 inches, and expand at the top to double that breadth. I have on no occasion found any unpleasant flavour from this process. When the dairy during summer weather reaches continuously a temperature up to but not exceeding 60°, I find my milk on standing 36 hours affected with a sour taste. If I cannot reduce the temperature by the cold water, I cream after 24 hours, to keep the old milk sweet, in which state alone it is saleable. For my purpose, I am disposed to think a temperature of 52° to 56° the most desirable. *Y.*

Guano Buying.—The following paper by Mr. Prideaux, in the "Journal of the Bath and West of England Agricultural Society," appears to me so important at the present season that, believing your readers will agree with me in this opinion, I would advise its being extracted and published in your columns. *M. S.* "Guano, now become so important to the farmer, is so widely different in quality, that something like a standard of its real and comparative value is very desirable for the buyer, to show him what is best worth his money. Besides the shameful adulterations it has undergone at home, and may do equally abroad, it is liable to unintentional casualty in collecting, by stones, earth, or sand coming up with it. And even when quite genuine its value is very different, according to the degree of moisture and stage of decay. An average analysis of Peruvian guano by Professor Way gave per cent.:—

Moisture ...	... 13		
Organic matter	... 53	containing ammonia	... 17
Phosphates ...	... 24		
Alkaline salts	... 9	containing potash ...	... 3½
Sand, &c. ...	... 1		
	100		

The moisture and sand are, of course, worth nothing: the less of them the better. The organic matter he values only for its ammonia, which is worth full 6*d.* per lb., so that a sample yielding 17 lbs. of ammonia will be worth 1*s.* per 100 lbs., or 22*s.* per ton, more than one containing only 15 lbs. (unless the latter be richer in phosphate or potash). Phosphate of lime is worth about double the price of bone-dust, after deducting the other valuable materials which bone-dust contains. On this principle Professor Way estimates it at ¾*d.* per lb.; and the potash, from the cheapest source (the sulphate or muriate), at 2¼*d.* Hence an average sample of genuine Peruvian guano may be reckoned as follows:—

	lbs.		d.		s.	d.
*Ammonia	17	at	6	=	8	6
Phosphate	24	at	6¾	=	1	6
Potass	3½	at	2¼	=	0	8
					10	8 per 100 lbs.
					or 11	10 per cwt.
					= £11	16 8 per ton;

rising or falling 11*s.* per ton for every pound of ammonia more or less. To which I should add (but without Professor Way's sanction) full 10*s.* per ton for the other organic matters and alkaline salts, making 12*l.* 6*s.* 8*d.* per ton. But how to render this available to the farmer, who cannot assay his guanos, as the publication of any simple tests would immediately lead to their evasion? The most feasible method seems to be, always to buy guano under guarantee of a certificate of analysis given with the invoice: from which the farmer can reckon its value by comparison with the standard. If he has full confidence in the seller, this may be sufficient; but if he wishes to satisfy himself further,

* Professor Voelcker values ammonia at present price at 9*d.*

he may get out an average sample, by drawing a portion from the centre of every bag (or of a sufficient number to ensure a fair sample); mix it all well together, and divide it into two halves. Take one to an experienced chemist, who, for about 7*s.*, can make a rough check assay, sufficient to guide him about purchasing; and put the other in a bottle, cork, and seal it airtight, and keep it with the certificate in a cool place till the season is over; when, if the guano has failed, he can have it regularly analysed, and make his claim upon the dealer in case of fraud or error in the certificate, which, however, would rarely (if ever) happen if the check assay was properly executed. This is thrown out as a rough suggestion for the consideration of scientific agriculturists, to meet any objections, and to facilitate its use, both to the buyer and seller. It is to the interest of both where both are honest. My estimates of ammonia, &c., may be considered too low. But it must be remembered that they are only proportionate, to rise and fall with the market. It may be thought their values are not truly proportionate; if so, they may be corrected. But let us give the farmer some effective guide by which he may know what he is buying, and not have to pay 6*l.* for a sample worth perhaps less than 5*l.*, just because it bears the same name."

Steam Cultivation.—I have been reading the articles of "I. A. C." on the above subject with much pleasure. Without doubt the approaching trial of agri-motives at the Carlisle meeting will prove quite as interesting as the trial of locomotives did on the Liverpool Railway some years ago. Our agricultural mechanists must not be disheartened if they do not succeed in this their first attempt; their chance of success is not so certain as was that of the projectors of the railway; in this latter instance they must bear in mind the roadway or path for the machine whose power was required, was found out and invented: in other words, the method to be pursued to attain a certain end was defined and accepted. All that the company advertised for or wanted was an engine, which would become operative in conjunction with the method discovered, viz., a railroad. Now, unluckily, we have not advanced to this stage in respect to the steam agri-motive advertised for; the pathway or roadway whereby it can be rendered effective and profitable has to be invented as well as the engine. Inventors should reflect on this. If the contrivers of the locomotive had started their engine on the old or common road, they would not have got along at a greater speed than 10 miles an hour, and the invention must have failed. Hence, from this experience of the past, I infer that if intending competitors mean to work their steam agri-motives in the old track or roadway of the plough, they will fail; they will be beaten hollow, both in time and quantity, by a 2-horse plough, and when too late (for this year at least) they will learn this axiom, viz., that a new power geared on to old mechanism demands a new pathway for its more effectual and profitable development. But I desire especially to call attention to the letter of your correspondent "S.," who has touched upon the two essential points connected with the application of steam to cultivation; he comments upon the tillage part of the subject, and also on the mechanical. What is tillage? What is it a farmer wants? What is the object desired by the operation called tillage? Do you want the soil laid up in a series of ridges 12 inches high in lumps and clods, for the frost first to pulverise, that the atmosphere may then act upon it? or do you wish the soil to be first ground up, and then laid up in ridges in a so finely-pulverised state that the atmosphere may at once act upon it? It appears to me the two proceedings would come to precisely the same thing in the end. But there is one thing I know, which is that it requires a much less amount of power to grind up the soil by degrees into the pulverulent state than it does to break it up in lumps all at once, or by one upheaving stroke. The first process would require more time to effect it, hence the machine must be larger than the tool which would accomplish the latter. I do not at all disapprove of the process of ploughing or shaving the soil; quite the reverse. I consider that a certain number of ploughing points (mechanically combined and mechanically used in operating on the soil) would make a very good and simple steam-driven cultivator for abrasion or pulverisation. But I do disapprove of the implement called a plough, and utterly condemn the method of operating with it in the field. It is not a machine and is not worked mechanically; it is only a hand-saw, and is worked like a hand-saw—up and down—and yet our best machine-makers will stick to this up-and-down and method of operating. Several years ago I came to the conclusion that the soil was neither more nor less than an aerial-manure trap, and that hence if you succeeded in laying up such soil in ridges, any how and by any means, you would have gained the great end sought for by tillage; the atmosphere would then breathe through the ridge, naturally breathing into it the breath of life, vivifying and fertilising it; the soil would filter the atmosphere of its fertilising particles and appropriate them. Based on this conclusion, I projected a tillage machine. I threw overboard all the routine of the old methods, and sought solely to attain a certain end, and to fulfil certain required mechanical conditions. Unluckily my investigations terminated in the discovery that my new machine involved a new method of operating in the field; hence it has never been patronised, but probably will be when all other schemes have been tried and shall have failed. "S." is evidently versed in mechanics, and I beg particularly to call his attention to the fact that to all our field machinery there is no such thing as a fixed point whereby, or rather wherefrom, it can operate on the raw material. Now, I think he will agree with me that mechanism is not machinery at all unless it has a point of attachment (*point d'appui*, as our allies would term it). I hold that for machinery to become operative on a material to be manufactured with accuracy and effect without a fixed point of attachment is simply impossible. After all their efforts, the ingenious mechanism we see displayed in Garrett's hoe or in Hornsby's drill is as good as thrown away; for it will be observed, the capability of execution of each of these pieces of mechanism depends wholly upon the caprice of a horse or the fallible guidance of a man. What can be more humiliating than the knowledge that for all our tillage mechanism there is no other point of attachment than the tail-end of a horse? I should like to hear what "S." has to say about the necessity for a fixed point for our field machinery, because if he grants there ought to be one to insure accuracy and efficiency in working, by a natural consequence the introduction of the fixed point would lead to a revolution in the whole *modus operandi* of hoeing, sowing, and ploughing. *Charles Burcham, London.*

Societies.

ROYAL AGRICULTURAL OF ENGLAND.

WEEKLY COUNCIL, *May* 16.—Mr. RAYMOND BARKER, V.P., in the chair.

DAIRY MANAGEMENT.—Mr. Horsfall informed the Council that the greatest amount of butter obtained in his dairy from a given quantity of milk was in December, 1854, from cows on stall food, when it reached 27¼ oz. of butter from 16 quarts of milk. He took that opportunity of correcting an error in his communication of last week, in which it was stated: "On Monday, April 30, 16 quarts of cream having yielded 26 rolls (of 25 oz. each) of butter. The "26 rolls" should have 16 rolls.

LECTURE.

CHEMICAL PRINCIPLES INVOLVED IN THE PRODUCTION OF BUTTER.—Professor Way, consulting-chemist to the Society, delivered a lecture before the members on "the Chemical Principles involved in the production of Butter." The subject, he said, naturally divided itself under two heads—the 1st, that of so treating cows as to cause them to produce a large quantity of milk rich in butter; the 2d, that of so treating the milk as to separate as fully as possible, and in the greatest perfection, the butter which it contains. The first is a question of physiology; the second one dependent partly upon chemical, partly upon physical principles. The one involves the phenomena of animal life, and is materially influenced by race and breed in the individual animal, and to a certain extent, therefore, is beyond our control; the other an affair of matter with which we may deal at our pleasure, and in the treatment of which we may perfectly control the results, inasmuch as we have full command of the conditions. He did not, on the present occasion, intend to enter at any length upon the former branch of the subject, which might be much more ably handled by his colleague, Prof. Simonds. Mr. Way called attention to the great and fundamental doctrine from whence all our reasoning on the subject of animal nutrition now started, namely, the identity, or almost identity, between the principles of the vegetable and animal body. The conclusion founded upon this identity, and which he said was natural enough, was, that with slight modifications the vegetable principles were assimilated by the animal frame; the albuminous matters being converted into flesh and muscle, the oily ingredients into animal fat, and the mineral salts of the food into bone and other solid parts of the animal body. Still he would wish to guard them against the conclusion, that because milk is an animal product of well-defined chemical composition, and because, again, the composition of various plants which serve as food for cows is well known, that, therefore, we might select food most rich in the vegetable principles analogous to cheese or butter, and using the body of the animal as a machine, might convert this food into so much cheese or butter at our pleasure. Such a conclusion was inconsistent with our knowledge of the laws of animal nutrition; not that it could be doubted that the nature of the food influenced materially and under like conditions absolutely the production of these animal products, but that we must admit a subordination of this supply to the functions of the animal—the formation of certain animal principles presupposing a supply of similar principles in the food, but a greater or less supply of these principles not being necessarily attended with a corresponding increase of their representatives in the product; indeed, the balance of evidence on the subject of the production of butter seemed to be in favour, for this purpose, of that class of substances which contained the greatest proportion of nitrogenous, or cheese-forming principles. Something of the kind had certainly been found to be the case in the artificial feeding of plants, in which, greatly through Mr. Lawes' experiments, we had found that the Wheat crop, by no means the most rich in nitrogen, benefited more than most others by manures containing this element, and was not sensibly affected by phosphoric manures, although eminently a phosphate-containing plant; whilst Turnips, on the other hand, not containing any great quantity of phosphates, are successfully cultivated by this artificial addition. Mr. Way remarked that if the time at his disposal, by the indulgence of the members, should allow of it, he would have a few remarks to make before he sat down on the subject of the treatment in regard to food, &c., of cows, but that it seemed more conducive to the right understanding of the subject that he should first draw their attention very shortly to the composition of milk, and the circumstances affecting the successful extraction of the butter from it. The milk of an animal was intended to form the sole food of its young for a certain period after birth. We should expect it therefore to contain all the principles necessary, not only for the support of life, but for the growth and increase of the animal frame. Milk should be, and indeed was, the type of a perfect food. We found in it therefore a representative of those substances fitted for the production of flesh, another of those adapted to form fat, a third suited to support respiration, which is the proximate cause of animal heat, and lastly the various earthy and alkaline salts which form the bones and are necessary to the constitution of the blood and animal fluids generally, these substances being all mixed up into a comparatively homogeneous liquid by the presence of a large quantity of water. Mr. Way now called attention to the different constituents of milk, namely, curd, called by the chemists casein, butter, sugar of milk, &c. Commencing with the latter, he explained how, under the influence of ferments, it was capable of conversion into an acid substance called lactic (or milk) acid. He stated that butter contained two or three fatty substances, having different melting points, and consequently more or less fluid at given temperatures, hence the different solidity of butter according to food and other conditions of its production. One or more of these fatty matters were liable under the influence of fe ments, or by the action of the air, to pass into other compounds of a rank disagreeable smell and flavour. The curd of milk was a substance unlike the others, containing nitrogen, and was liable by exposure to the air to the putrefactive changes to which all other similar animal matters were subject. In the commencement of these changes the casein became a ferment, having the power rapidly to convert milk sugar into lactic acid—hence the spontaneous coagulation of milk: the altered casein had also the property of converting the fatty matter of butter into the varied products to which he had alluded, and which were so objectionable in bad butter. In the changes to which these three substances were subject would be found the key to all the phenomena observable in a dairy, and to every precaution which experience had dictated. Mr. Way shortly adverted to the processes for the preparation and preservation of butter. The first of these was the creaming of the milk—a mechanical process chiefly, but possibly involving some slight chemical change of the casein. The milk, being an emulsion as it were of oil and water, would of course after a time tend to separate, upon standing, into two portions, the lighter rising to the surface. The butter did not, however, as they well knew, separate altogether in this way, but the cream was a kind of concentrated milk, in which the proportion of butter was largely increased. Although it was an axiom in the dairy that perfect stillness of the milk was essential to successful creaming, he was not quite sure whether the communication of a very gentle combined centrifugal and ascending motion of the fluid might not conduce to much greater rapidity in the rising of the cream. Such a motion might readily (by means of weights or springs) be given to the milk pans themselves by placing them on slowly rotating tables; the sides of the pans having flanges on the inside sloping from the top to the bottom, which would communicate an ascensional motion to the liquid. Mr. Way thought that this movement would be likely to be beneficial. The oily particles would more readily receive the upward impetus which was favoured by their own buoyancy, whilst in the descending current the reverse would be the case. Of course he meant that the movement of the pans should be of the very gentlest nature. The second operation, namely, churning the cream, was also a mechanical one, but it was attended with chemical changes. In the process of churning heat was produced, partly no doubt from friction, but also from other and not mechanical causes. The cream, too, if sweet when put into the churn became sour during the agitation; and this was evidently due to an absorption of oxygen by the casein and the conversion, under its influence, of the milk sugar into lactic acid. Indeed the souring of the cream seemed an essential part of the process. He could not help believing, however, that all or nearly all the mischief that happened to butter on keeping was due to the alteration of casein then taking place during the churning. Butter always contained a portion of casein, in some cases not exceeding a half per cent., in others as much as 3 per cent. of its weight. It was to the presence of this substance in butter that the difficulty of keeping it was to be attributed. He had before explained what changes might be expected under the circumstances. If the casein, however, were as yet unaltered when it was included in the butter, it would require the presence of air to enable it to make the butter rancid. Now, supposing the souring of cream to be important in churning, why not obtain it artificially by the addition of lactic or acetic acid; at the same time, as far as possible, excluding air from the churning? There could be no reasonable doubt that this small quantity of altered casein was the insidious enemy which, for butter that was to be kept any length of time, it was so important to guard against. Butter after being melted in water and strained whilst hot through cloths to separate the curd might be kept any length of time without change, but of course it had lost all the agreeable flavour of ordinary fresh butter. With regard to the preservation of butter by salting, Mr. Way wished to show the great difficulty which must exist of mixing three or four per cent. of salt intimately with butter by the ordinary methods of hand treatment. The salt was intended to render the cheesy matter inactive, but it could only do this by absolute contact with every particle, and such contact he was convinced could not be attained manually. A machine had been invented in America for butter curing, the butter, enclosed in an endless bag, being drawn between grooved rollers immersed in a vessel of water, the salt being at the same time added by a hopper. This machine, however, did not seem to him fitted to ensure a perfect mixture of the butter and salt, and the water was objectionable because it destroyed the flavour of the butter. He had several years ago thought that a machine somewhat like Clayton's clay-screening cylinder would be admirably adapted to mix the salt with butter—a cylinder, with a disc perforated with small holes placed at equal distances from its end, through which the butter might be forced, like vermicelli, backwards and forwards by pistons at either end, acting alternately, would readily be arranged. At the same time, by connecting this cylinder with an exhausting pump, the air might very effectually be removed, so that finally, when the process was complete, the butter might before removal be pressed into a solid mass, and immediately received in a proper tube for preservation. Mr. Way believed that butter so preserved, with an intimate admixture of salt and free from air, would keep good and sweet for any length of time. He hoped that the principles he had endeavoured to put before them would bear out the practical experience of those present. The management of a dairy might be summed up in three words—temperature, cleanliness, ventilation. Temperature, because all the changes to which he had referred were very much enhanced in activity by every degree of temperature above a certain point. Cleanliness, because everything that assisted the decomposition of casein, which all animal matters did, would promote decay in the milk and its contents. Ventilation as a part of cleanliness—cleansing, in fact, the atmosphere—and in respect to this latter point, he would suggest the use of freshly burnt charcoal as likely to be of the greatest service in the dairy. It had lately been shown by Dr. Stenhouse that charcoal absorbed from the air decaying matters with great rapidity. The removal of such matters from the air was one of the great objects of ventilation in a milk-house, and he would strongly recommend a trial of it spread in baskets or thin layers in different parts of the dairy.

On the motion of Lord Berners, seconded by Mr. Slaney, the best thanks of the Council were voted to Professor Way for this interesting and scientfic lecture; Lord Berners taking that opportunity of dwelling upon the importance of ventilation in dairies and stables, and of appropriate feeding of dairy cattle, as derived from his own experience; and Mr. Slaney of suggesting that a little work for cheap distribution might be drawn up easily and with much advantage, stating plainly and concisely the points of our knowledge on essential conditions connected with dairy subjects.—Mr. Caird bore testimony to the practical value of Mr. Horsfall's dairy arrangements, he having visited his establishment in Yorkshire four years ago.—On the motion of Mr. Jonas Webb, the best thanks of the Council were voted to the Chairman for the kind and efficient manner in which he had presided over the meeting on that occasion.

The Council adjourned over Wednesday the 23d, (being the Derby-day), to Wednesday the 30th of May, when the discussion would be resumed.

Farmers' Clubs.

LONDON:—*The General Application of Steam Power to Agricultural Purposes; and, if practicable, what would be its natural results?* This subject was intro-

duced at the meeting last week by Mr. J. Williams, of Baydon, Wilts. The following is an abridged report of his remarks:—There can be no doubt that the manufacturing interest owes its hitherto flourishing condition to the unlimited power of steam. Equally apparent to all who are practically acquainted with agricultural pursuits is the expensive mode of cultivation that farmers have been obliged to adopt—viz., manual and horse labour. Portable steam-engines now being at our command, I will attempt to describe the purposes to which they have been applied, and then call attention to the possibility of cultivating the soil by means of this gigantic power. With respect to threshing machines, grinding-mills, chaff-cutters, and any other purpose to which steam power has hitherto been applied about a homestead, I have never had a doubt, since I saw the first portable engine practically at work, that it was the engine best adapted for general farm purposes. A fixed engine, it is true, has its advantages, requiring less fuel, having its water at hand, and being always ready for work, while the work is done to the best advantage under cover; but against these advantages must be placed the immense cost of hauling the whole produce of the farm to one point, and then drawing the whole of the manure back again. [Mr. Williams then described his plan for avoiding this cost.]

I will imagine a farm of 300 acres in extent, and whether the homestead be at one end (which is too often the case) or in the centre. I will assume the produce of the 100 acres nearest the homestead to be drawn thereto. The produce of the other 200 acres can then be stacked near to where it grew. If the four-field system be adopted the very land which produced the Lent straw crop will require the manure next year, either for a green crop or for Wheat; and, assuming that a crop of Turnips or Swedes is growing in an adjoining field, the rick can be placed close to the piece, that the fodder may be consumed with the Turnips; the steam-engine being taken there for threshing the corn when required. Of course a pen or yard of hurdles must be made for the sheep; and when they have finished, the straw left will be of little value, provided it is left in that state; but by doubling the hurdles with straw between, and having an old waggon-carriage lengthened and roofed, containing a small granary over the hind part similar to this model on the table, a temporary yard for pigs, with a house, will be obtained, and with good feeding the straw will be converted into excellent manure. The pigs, likewise, will consume any stray corn which may be left in the same, and will be far more healthy while shifting from place to place than they are when continually kept in one yard at home. A portion of the animal manure made at the homestead could be drawn and mixed with that which was thus obtained; and the heap would be as good in quality as if the bulk of the straw had been drawn home to the fixed engine; the expense and time of double cartage being, moreover, saved.

Returning more immediately to the subject of steam power, I will next notice Mr. Mechi's irrigation by steam. The system of irrigation appears to be adopted in some few instances in Scotland, and with very great success; but how far it will answer the purpose in a general way, except where an unlimited supply of liquid manure can be obtained, I am not prepared to say, and I doubt if (except in few cases) it would ever repay the outlay required to bring it practically to bear. Mr. Mechi has written to me respecting his steam-engine:—

"My steam-engine is at 30 lbs. pressure per inch, and 70 revolutions per minute, of six-horse power; but as we work at 70 lbs. per inch, and evaporate 70 gallons of water per hour, we get 11-horse power out of her; she works a pair of 4 feet 4 inch mill-stones, drives the chaff-cutter, threshing machine, and dressing machine, pumps all the water for the live stock, works a pair of force pumps for irrigation, 20-inch stroke, and 6 inches diameter, throwing 100 gallons per minute: a Linseed-crusher and an air pump are also depending on the steam-engine. It has been in use eight years, and is likely to last many more; the consumption of fuel is 10 cwt. of coal per diem of 10 working hours; without it we should be in a poor predicament."

Fowler's draining plough is another instance of the practical application of steam power to agricultural purposes. I made a journey into Hertfordshire about two months since to witness its operation; and I feel convinced, from what I there saw, backed by my own experience, that the bringing of steam power into general use is only a question of time.

I saw there an eight-horse power engine, made by Clayton and Shuttleworth, drawing not less, in my opinion, than 200 horse power, including the friction of the machine, wire rope, &c. The engine was stationary at one end of the field, and the distance at which it appeared capable of working the plough at the further end was nearly, if not quite, half a mile. It did its work in a most practical manner, drawing in the pipe tiles, and finishing the work to the satisfaction of all who saw it.

I now come to that part of my subject which has reference to what is most to be desired, but what also there is no question is the most difficult, viz., the ploughing and cultivating of the soil by steam power. [Mr. Williams then referred to the history of the subject.] Lord Willoughby D'Eresby has been somewhat successful with his ploughs. His steward, Mr. Scott, writes me word:—

"We now use three ploughs at once, and they work right and left-handed, alternately; we can plough in eight hours about four acres of land, at a cost of about 35*s.* per day, including men's wages, fuel, oil for engines, and a horse and watercart to convey water to the engines." You will observe this is somewhat less than 9*s.* per acre, and considering that Lord Willoughby uses two engines, one at each end of the field, which must be a great expense as regards fuel (it being necessary to keep up two fires, whilst only one engine at a time is at work), if the land is well ploughed at that cost, it is a step in the right direction.

The Marquis of Tweeddale, at Yester, in Scotland, has been ploughing by steam-power. I am informed by his Lordship—

That with two 14-horse-power engines he propels two ploughs at the rate of 2½ miles per hour, ploughing the immense furrow each of 14 to 15 inches in depth, whilst the two furrows take a breadth of 30 inches, or 15 inches each. The soil is generally a stiff tenacious clay; so you may imagine the immense strain of two such furrows, with the friction of the rope going at the rate of 2½ miles per hour! His lordship mentions some of the difficulties he has had to contend with; amongst which are stones, pan, and roots of trees, which from the circumstance of his ploughing to the depth of 15 inches, of course renders him the more liable to meet with. But he has overcome these obstructions by ploughing with horses in the localities where they existed, and having once been surmounted the difficulty no longer exists.

Mr. Usher, of Edinburgh, who has invented a steam-plough to travel over the surface of the soil and plough the ground by a rotary motion, states, in reply to a letter which I wrote to him:—

"The drawbacks I had in my first machine were want of steam-power and too much weight. The first of these I have obviated in the new one by having 210 feet of heating surface in the boiler, against 130 feet in the last one, which gives six horses' more steam; and the latter objection I think will be entirely overcome by this additional power. The work done I think is nearly perfect, being exactly such as C. W. Hoskyns has set forth so vividly in the little volume 'Talpa,' and the expense per acre is about one-third of the cost by horses."

I will now add that, having been studying this subject for the last three years, I have succeeded in bringing out a very different implement from any of those which have been before described, viz., "a ploughing machine;" and so satisfied am I of its practicability that I have taken out a patent for the invention.

I came to the conclusion that steam-ploughing ought to be done by the simple 4, 5, or 6 horse-power engines, which are generally used for farm purposes. Such an engine would be quite sufficient to propel from three to six ploughs at a time, according to the nature of the soil, inasmuch as my engine (one of five-horse-power), which drove a strap nearly at the rate of 20 miles per hour, by reducing the speed to about two miles per hour would increase her power exactly in the same ratio as the speed was diminished. I immediately set about constructing a machine, to be driven by the engine, which will plough a 20-yard land without moving, and draw the ploughs in furrow backwards, as well as to her, by means of a pulley fixed in a frame at the other end of the field. If steam-ploughing is brought about, it should be done by the same engine that does the other work of the farm; and, as a six-horse engine is the outside power that is generally required for that work, so it will be quite sufficient for all field purposes. Remember, one of the difficulties the Marquis of Tweeddale has met with is the weight of the engine; and Mr. Usher has written to the same effect. And again, there is another grand consideration, viz., the cost of the engines, more especially where two are used, which would put it out of the power of most farmers to meet so great an outlay. I am certain, that with a six-horse-power engine driving a machine I am now about to make, considerably lighter than the one I have tried, I shall be able to draw, at the rate of two miles an hour, from four to six ploughs at once at the ordinary depth which is ploughed in the west of England, to plough both to and from the engine, draw out the spare rope, plough from 10 to 20 yards in width without moving the engine; and when required to move, the engine shall propel both herself and the machine on to the next land. As far, then, as I have been enabled to observe, I do not hesitate to give it as my opinion that it is or will be practicable to cultivate the bulk of the soil by means of steam-power, and that it is only a question of time as to the best mode of doing it. The remainder of the question which I have undertaken to introduce is, 'if this great work should be practical, what would be its natural results?' There are three especial objects which I have no doubt will be affirmed if this gigantic undertaking can be accomplished. In the first place, the work on all wet soils will be much better done, as the treading of the horses will be avoided; and again, with regard to a wet season, when the farmers, afraid of getting behind with their work, often go to plough when they ought not to do so, thereby doing as much harm as good. In the second place, I will allude to the individual benefit which the farmers and labourers will in all probability derive from this system. The farmers would require a considerably less amount of horse-power, which is always a sinking fund; they would be enabled to do their work at the best seasons, and I imagine at considerably less cost. I am not prepared to say at what cost; but I will assume, from what I can judge of my own proceedings, and looking forward to a more perfect system, that I should be able to plough 6 acres per day of nine hours with a 6-horse engine. The expenses, as far as I can look into them, from the number of hands required, would be about as follows:—

Dr.	£	s.	d.	Cr.	£	s.	d.
6 cwt. of coal	0	6	0	By ploughing six acres of land, at 5*s.* 6*d.* per acre	1	13	0
Oil	0	1	0				
Water-carting... ...	0	2	6				
Engineer	0	3	0				
Steersman	0	3	0				
Conductor	0	3	0				
Four men, at 2*s.* each	0	8	0				
Two stout lads ...	0	2	0				
	1	8	6				
Wear and tear, 15 per cent.	0	4	6				
	£1	13	0		£1	13	0

If these figures of mine at all approach to what may hereafter prove a fact, it will require but little argument to convince any farmer that to plough or cultivate the land for 5*s.* 6*d.* per acre is what he has never been able to do before. With respect to the labourers, I am satisfied that the more machinery and steam power are introduced, the better will be their position in society. It is a mistaken notion to suppose that the introduction of steam power will displace the demand for manual labour; for facts prove the contrary. Those who employ the greatest amount of machinery employ likewise the largest number of hands. Lastly, I shall place before you a statistical account of the immense benefit the nation at large would derive from the practical accomplishment of this herculean task. If I fix the horse-power necessary to cultivate the land of Great Britain at four to every 100 acres, I cannot be far wrong; and taking the number of cultivated acres at 47,000,000, and multiplying them by four to every 100, I arrive at the enormous quantity of 1,880,000 horses kept for the purpose of tilling the soil! They cannot, in my opinion, taking the prices of the past year, be kept for a less sum than 30*l.* each, to which must be added 5*l.* per horse for casualties (depreciation), wear and tear, shoeing, and harness. There are various opinions as to the cost of maintaining a horse for a twelvemonth, but in 99 cases out of 100 it is all assumed. By not reckoning strictly everything horses consume, people are led to suppose that they can be kept for a less sum than I have named: but where a regular account is kept the case is different. I can mention an instance of a gentleman who is present (Mr. Thomas, of Bedfordshire), who is noted for the admirable accounts which he keeps, and who has written to me to the effect that his horses cost him, with corn at the present price, not less than 14*s.* per week, or 36*l.* 8*s.* per annum, besides casualties, wear and tear, &c. I do not take his figures, because I think the bulk of the horses alluded to are not kept so well as his; but it is a question whether such keeping is not the cheapest in the long run. Reckoning, therefore, the maintenance of each horse at 30*l.*, the annual amount is the same as the cost price before mentioned, viz., 56,400,000*l.*! It has likewise been asserted by our friend Mr. Baker and others, that the horses consume from a fifth to a fourth of the whole produce of the soil. It now remains to consider what portion of this horse-power could be dispensed with, provided steam could be applied as a substitute? If the bulk of the soil could be tilled by steam, I am inclined to think half the horses might be spared, by stacking the corn in harvest where it grew, as I mentioned at the commencement of my remarks; but as I wish to keep within bounds, I will only take a third, which would amount to the number of 626,666 and a fraction, and then the annual cost of maintaining them would be 18,800,000*l.*, which would be saved, not only to the farmer but to the kingdom at large, inasmuch as the food previously consumed might and would be turned to a better account. I have been often asked, "If you do away with your horses what will you do for manure?" The question might as well be put, "What will you do with the food the horses now consume?" As this is the last and most interesting part of the question, let me state, though I shall probably astonish many of my hearers in doing so, the amount of animal food which might be produced with the farm produce thus saved. It will be seen from the above calculation that by dispensing with the horse power necessary to cultivate the soil, a saving in corn and fodder would be effected to the amount of 18,800,000*l.* Now, if I take the price of beef and mutton at 7*d.* per lb., or 4*s.* 8*d.* per stone of 8 lbs., the food so rescued from consumption by the horses would produce, assuming that they would not be fed at a loss, 80,571,500 stones of meat; or 805,715 oxen, of 1[illegible] each, or 8,057,150 fat sheep of 10 stones each. Such, sir, would be the result if this desirable object were practically carried out.
